[64263] Another function of VGAM1928 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog F (avian) (MAFF, Accession NM\_012323), a gene which Binds to the US-2 motif of the oxytocin receptor gene; has a leucine zipper structure. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAFF. The function of MAFF has been established by previous studies. Inoue et al. (1994) demonstrated that the US-2 element in the promoter of the human oxytocin receptor gene (OXTR; 167055) binds specifically nuclear proteins from human myometrium at parturition. Using the US-2 element in a yeast 1-hybrid system to screen a human myometrium cDNA library, Kimura et al. (1999)

isolated a full-length cDNA encoding the homolog of chicken MafF. Human MAFF encodes a deduced 164-amino acid protein with a predicted molecular mass of 17.8 kD. Like other small MAF proteins (e.g., MAFG, 602020), it contains an extended leucine zipper structure and lacks an N-terminal transactivating domain. Northern blot analysis showed a strong 2.6-kb signal in mRNA from term myometrium and from kidney, but not from non-pregnant myometrium. The MAFF protein is also preferentially expressed in term myometrium. The authors concluded that MAFF plays a role in OXTR gene upregulation at term.

[64264] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64265] Dunham, I.; Shimizu, N.; Roe, B. A.; Chissole, S.; Hunt, A. R.; Collins, J. E.; Bruskiewich, R.; Beare, D. M.; Clamp, M.; Smink, L. J.; Ainscough, R.; Almeida, J. P.; and 205 others : The DNA sequence of human chromosome 22. *Nature* 402: 489–495, 1999. ; and

[64266] Inoue, T.; Kimura, T.; Azuma, C.; Inazawa, J.; Takemura, M.; Kikuchi, T.; Kubota, Y.; Ogita, K.; Saji, F. : Structural organization of the human oxytocin receptor gene. *J. Biol.*

Chem. 2.

[64267] Further studies establishing the function and utilities of MAFF are found in John Hopkins OMIM database record ID 604877, and in cited publications numbered 675 and 6759 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM\_014268) is another VGAM1928 host target gene. MAPRE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE2 BINDING SITE, designated SEQ ID:15544, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64268] Another function of VGAM1928 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM\_014268), a gene which The functional inactivation of the APC gene product is a key event in colorectal tumorigenesis. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MAPRE2. The function of MAPRE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM\_012326) is another VGAM1928 host target gene. MAPRE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:14716, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64269] Another function of VGAM1928 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM\_012326), a gene which interact with cytoplasmic microtubules, and with the adenomatous polyposis coli. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3. The function of MAPRE3 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM\_165540) is another VGAM1928 host target gene. MAT1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAT1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAT1A BINDING SITE, designated SEQ ID:43665, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64270] Another function of VGAM1928 is therefore inhibition of Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM\_165540). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAT1A. Mannosyl (alpha-1,3-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM\_002406) is another VGAM1928 host target gene. MGAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

MGAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT1 BINDING SITE, designated SEQ ID:8228, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64271] Another function of VGAM1928 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM\_002406), a gene which exists as a single protein-encoding exon. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT1. The function of MGAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM165.Meningioma Expressed Antigen 5 (hyaluronidase) (MGEA5, Accession NM\_012215) is another VGAM1928 host target gene. MGEA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGEA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA5 BINDING SITE, designated SEQ ID:14518, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64272] Another function of VGAM1928 is therefore inhibition of Meningioma Expressed Antigen 5 (hyaluronidase) (MGEA5, Accession NM\_012215), a gene which has a hyaluronidase activity. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGEA5. The function of MGEA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM801.

Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458) is another VGAM1928 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17745, to the nucleotide sequence of VGAM1928 RNA,

herein designated VGAM RNA, also designated SEQ ID:4639.

[64273] Another function of VGAM1928 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379. Nuclear Factor I/B (NFIB, Accession NM\_005596) is another VGAM1928 host target gene. NFIB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NFIB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFIB BINDING SITE, designated SEQ ID:12122, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64274] Another function of VGAM1928 is therefore inhibition of Nuclear Factor I/B (NFIB, Accession NM\_005596), a gene

which recognizes and binds the palindromic sequence 5'-ttggcnnnnngccaa-3' present in viral and cellular promoters. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIB. The function of NFIB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM100.5'-nucleotidase, Cytosolic III (NT5C3, Accession NM\_016489) is another VGAM1928 host target gene. NT5C3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NT5C3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NT5C3 BINDING SITE, designated SEQ ID:18582, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64275] Another function of VGAM1928 is therefore inhibition of 5'-nucleotidase, Cytosolic III (NT5C3, Accession NM\_016489). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5C3. Oxidative-stress

Responsive 1 (OSR1, Accession NM\_005109) is another VGAM1928 host target gene. OSR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:11588, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64276] Another function of VGAM1928 is therefore inhibition of Oxidative-stress Responsive 1 (OSR1, Accession NM\_005109), a gene which mediates stress-activated signals. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1. The function of OSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Paired Box Gene 5 (B-cell lineage specific activator protein) (PAX5, Accession NM\_016734) is another VGAM1928 host target gene. PAX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by PAX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX5 BINDING SITE, designated SEQ ID:18789, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64277] Another function of VGAM1928 is therefore inhibition of Paired Box Gene 5 (B-cell lineage specific activator protein) (PAX5, Accession NM\_016734), a gene which plays a role in B-cell differentiation, neural development and spermatogenesis. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX5. The function of PAX5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151. Protocadherin 11 X-linked (PCDH11X, Accession NM\_032968) is another VGAM1928 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING

SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26789 and SEQ ID:26804 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64278] Another function of VGAM1928 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM\_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433. Phosphogluconate Dehydrogenase (PGD, Accession XM\_086151) is another VGAM1928 host target gene. PGD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PGD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of PGD BINDING SITE, designated SEQ ID:38522, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64279] Another function of VGAM1928 is therefore inhibition of Phosphogluconate Dehydrogenase (PGD, Accession XM\_086151), a gene which catalyzes a step in the pentose phosphate pathway, oxidates glucose-6-phosphate into 6-phosphoglucono-lactone. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGD. The function of PGD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. Phosphoinositide-3-kinase, Catalytic, Gamma Polypeptide (PIK3CG, Accession NM\_002649) is another VGAM1928 host target gene. PIK3CG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3CG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3CG BINDING SITE, designated SEQ ID:8512, to the nu-

cleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64280] Another function of VGAM1928 is therefore inhibition of Phosphoinositide-3-kinase, Catalytic, Gamma Polypeptide (PIK3CG, Accession NM\_002649), a gene which regulating cell growth. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3CG. The function of PIK3CG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1389. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982) is another VGAM1928 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30601, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64281] Another function of VGAM1928 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3. Pleiomorphic Adenoma Gene-like 1 (PLAGL1, Accession NM\_002656) is another VGAM1928 host target gene. PLAGL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAGL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL1 BINDING SITE, designated SEQ ID:8528, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64282] Another function of VGAM1928 is therefore inhibition of Pleiomorphic Adenoma Gene-like 1 (PLAGL1, Accession NM\_002656), a gene which regulates apoptosis and cell cycle arrest. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL1. The function of PLAGL1 and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM89. Plexin A1 (PLXNA1, Accession XM\_051261) is another VGAM1928 host target gene. PLXNA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLXNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNA1 BINDING SITE, designated SEQ ID:35790, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64283] Another function of VGAM1928 is therefore inhibition of Plexin A1 (PLXNA1, Accession XM\_051261). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNA1. Peanut-like 1 (Drosophila) (PNUTL1, Accession NM\_002688) is another VGAM1928 host target gene. PNUTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PNUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PNUTL1 BINDING SITE, designated SEQ ID:8547, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64284] Another function of VGAM1928 is therefore inhibition of Peanut-like 1 (Drosophila) (PNUTL1, Accession NM\_002688). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNUTL1. Peptidylprolyl Isomerase (cyclophilin)-like 1 (PPIL1, Accession NM\_016059) is another VGAM1928 host target gene. PPIL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPIL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIL1 BINDING SITE, designated SEQ ID:18133, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64285] Another function of VGAM1928 is therefore inhibition of Peptidylprolyl Isomerase (cyclophilin)-like 1 (PPIL1, Accession NM\_016059), a gene which catalyzes the cis-trans isomerization of proline imidic peptide bonds in

oligopeptides. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL1. The function of PPIL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1135. Protein Phosphatase 2, Regulatory Subunit B (B56), Epsilon Isoform (PPP2R5E, Accession NM\_006246) is another VGAM1928 host target gene. PPP2R5E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPP2R5E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5E BINDING SITE, designated SEQ ID:12922, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64286] Another function of VGAM1928 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Epsilon Isoform (PPP2R5E, Accession NM\_006246), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PPP2R5E. The function of PPP2R5E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM302. PR Domain Containing 4 (PRDM4, Accession NM\_012406) is another VGAM1928 host target gene. PRDM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM4 BINDING SITE, designated SEQ ID:14784, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64287] Another function of VGAM1928 is therefore inhibition of PR Domain Containing 4 (PRDM4, Accession NM\_012406). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM4. PSA (Accession NM\_021154) is another VGAM1928 host target gene. PSA BINDING SITE1 and PSA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSA, corresponding to HOST TARGET binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSA BINDING SITE1 and PSA BINDING SITE2, designated SEQ ID:22132 and SEQ ID:27741 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64288] Another function of VGAM1928 is therefore inhibition of PSA (Accession NM\_021154), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSA. The function of PSA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65. Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM\_000314) is another VGAM1928 host target gene. PTEN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTEN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTEN BINDING SITE, designated SEQ

ID:5850, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64289] Another function of VGAM1928 is therefore inhibition of Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM\_000314). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTEN. Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM\_000962) is another VGAM1928 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:6675 and SEQ ID:27896 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64290] Another function of VGAM1928 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/

H synthase and cyclooxygenase) (PTGS1, Accession NM\_000962), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. RAD17 Homolog (*S. pombe*) (RAD17, Accession NM\_002873) is another VGAM1928 host target gene. RAD17 BINDING SITE1 through RAD17 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD17, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD17 BINDING SITE1 through RAD17 BINDING SITE6, designated SEQ ID:8782, SEQ ID:28487, SEQ ID:28483, SEQ ID:28485, SEQ ID:28479 and SEQ ID:28489 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64291] Another function of VGAM1928 is therefore inhibition of RAD17 Homolog (*S. pombe*) (RAD17, Accession NM\_002873), a gene which may have a role in DNA damage-dependent and DNA replication-dependent cell cycle checkpoints. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD17. The function of RAD17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209. Regulatory Factor X-associated Protein (RFXAP, Accession NM\_000538) is another VGAM1928 host target gene. RFXAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RFXAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFXAP BINDING SITE, designated SEQ ID:6135, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64292] Another function of VGAM1928 is therefore inhibition of Regulatory Factor X-associated Protein (RFXAP, Accession

NM\_000538), a gene which binds to the x-box of mhc ii promoters and is a transcriptional regulator. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFXAP. The function of RFXAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM797. Regulator of G-protein Signalling 2, 24kDa (RGS2, Accession NM\_002923) is another VGAM1928 host target gene. RGS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS2 BINDING SITE, designated SEQ ID:8827, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64293] Another function of VGAM1928 is therefore inhibition of Regulator of G-protein Signalling 2, 24kDa (RGS2, Accession NM\_002923), a gene which inhibits signal transduction by increasing the gtpase activity of g protein thereby driving them into their inactive gdp-bound form. Accord-

ingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS2. The function of RGS2 has been established by previous studies. Genetic heterogeneity of Rieger syndrome has been suggested by the description of affected individuals with a variety of chromosomal abnormalities and by the report of failure to find linkage to 4q25 in 1 pedigree (Legius et al., 1994) Deletion of 13q14 was described in 2 cases (Akazawa et al., 1981; Stathacopoulos et al., 1987). Phillips et al. (1996) performed linkage analysis of a large 4 generation family and demonstrated that Rieger syndrome was not linked to 4q25 but to markers on 13q14. Phillips et al. (1996) pointed to forkhead (OMIM Ref. No. 136533) as an excellent candidate for the site of the mutation in this form of Rieger syndrome. They stated that if such mutations are found, this would be an example of a gene which can function both as an oncogene (producing rhabdomyosarcoma) and as a 'teratogene' (producing RIEG2).

[64294] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64295] Legius, E.; de Die-Smulders, C. E. M.; Verbraak, F.; Habex,

H.; Decorte, R.; Marynen, P.; Fryns, J. P.; Cassiman, J. J. : Genetic heterogeneity in Rieger eye malformation. J. Med. Genet. 31: 340–341, 1994. ; and

[64296] Phillips, J. C.; Del Bono, E. A.; Haines, J. L.; Pralea, A. M.; Cohen, J. S.; Greff, L. J.; Wiggs, J. L. : A second locus for Rieger syndrome maps to chromosome 13q14. Am. J. Hum. Genet. 59.

[64297] Further studies establishing the function and utilities of RGS2 are found in John Hopkins OMIM database record ID 601499, and in cited publications numbered 9486–326 and 9487 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ring Finger Protein 14 (RNF14, Accession NM\_004290) is another VGAM1928 host target gene. RNF14 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RNF14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF14 BINDING SITE, designated SEQ ID:10503, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64298] Another function of VGAM1928 is therefore inhibition of

Ring Finger Protein 14 (RNF14, Accession NM\_004290), a gene which associates with the androgen receptor (AR); functions as a transcriptional coactivator. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF14. The function of RNF14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827.RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799) is another VGAM1928 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9879, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64299] Another function of VGAM1928 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities

of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM\_018226) is another VGAM1928 host target gene. RNPEPL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNPEPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPEPL1 BINDING SITE, designated SEQ ID:20163, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64300] Another function of VGAM1928 is therefore inhibition of Arginyl Aminopeptidase (aminopeptidase B)-like 1 (RNPEPL1, Accession NM\_018226). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPEPL1. Retinitis Pigmentosa 2 (X-linked recessive) (RP2,

Accession NM\_006915) is another VGAM1928 host target gene. RP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:13794, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64301] Another function of VGAM1928 is therefore inhibition of Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM\_006915). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2. Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754) is another VGAM1928 host target gene. RUNX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:7501, to the nucleotide se-

quence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64302] Another function of VGAM1928 is therefore inhibition of Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012) is another VGAM1928 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8926, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64303] Another function of VGAM1928 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM1928 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250. Splicing Factor, Arginine/serine-rich 7, 35kDa (SFRS7, Accession XM\_002575) is another VGAM1928 host target gene. SFRS7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS7 BINDING SITE, designated SEQ ID:29897, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64304] Another function of VGAM1928 is therefore inhibition of Splicing Factor, Arginine/serine-rich 7, 35kDa (SFRS7, Accession XM\_002575), a gene which is required for pre-mRNA splicing. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS7. The function of SFRS7 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM191.Surfactant, Pulmonary-associated Protein A2 (SFTPA2, Accession NM\_006926) is another VGAM1928 host target gene. SFTPA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFTPA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFTPA2 BINDING SITE, designated SEQ ID:13810, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64305] Another function of VGAM1928 is therefore inhibition of Surfactant, Pulmonary-associated Protein A2 (SFTPA2, Accession NM\_006926), a gene which plays a role in innate host defense in the lung. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFTPA2. The function of SFTPA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM148.Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member

3 (SLC11A3, Accession NM\_014585) is another VGAM1928 host target gene. SLC11A3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC11A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A3 BINDING SITE, designated SEQ ID:15942, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64306] Another function of VGAM1928 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 3 (SLC11A3, Accession NM\_014585). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A3. Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM\_006598) is another VGAM1928 host target gene. SLC12A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC12A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:13377, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64307] Another function of VGAM1928 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM\_006598), a gene which is a potassium/chloride-cotransporter. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7. The function of SLC12A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM\_003056) is another VGAM1928 host target gene. SLC19A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A1 BINDING SITE, designated SEQ ID:9023, to the nucleotide sequence of VGAM1928 RNA,

herein designated VGAM RNA, also designated SEQ ID:4639.

[64308] Another function of VGAM1928 is therefore inhibition of Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM\_003056). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A1. Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM\_003043) is another VGAM1928 host target gene. SLC6A6 BINDING SITE1 and SLC6A6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC6A6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A6 BINDING SITE1 and SLC6A6 BINDING SITE2, designated SEQ ID:9006 and SEQ ID:9007 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64309] Another function of VGAM1928 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM\_003043), a gene

which transports taurine and other beta-amino acids like beta-alanine. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A6. The function of SLC6A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36.SRP46 (Accession NM\_032102) is another VGAM1928 host target gene. SRP46 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRP46, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRP46 BINDING SITE, designated SEQ ID:25792, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64310] Another function of VGAM1928 is therefore inhibition of SRP46 (Accession NM\_032102). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRP46. Suppression of Tumorigenicity 7 (ST7, Accession NM\_021908) is another VGAM1928 host target gene. ST7

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ST7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7 BINDING SITE, designated SEQ ID:22427, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64311] Another function of VGAM1928 is therefore inhibition of Suppression of Tumorigenicity 7 (ST7, Accession NM\_021908), a gene which has a role in regulating cell-environment or cell-cell interactions. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7. The function of ST7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Transcription Factor 19 (SC1) (TCF19, Accession XM\_175167) is another VGAM1928 host target gene. TCF19 BINDING SITE1 and TCF19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCF19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF19 BINDING SITE1 and TCF19 BINDING SITE2, designated SEQ ID:46661 and SEQ ID:46710 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64312] Another function of VGAM1928 is therefore inhibition of Transcription Factor 19 (SC1) (TCF19, Accession XM\_175167), a gene which plays an important role in the transcription of genes required for the later stages of cell cycle progression. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF19. The function of TCF19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM299.TH1-like (Drosophila) (TH1L, Accession NM\_016397) is another VGAM1928 host target gene. TH1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TH1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TH1L BINDING SITE, designated SEQ ID:18536, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64313] Another function of VGAM1928 is therefore inhibition of TH1-like (Drosophila) (TH1L, Accession NM\_016397). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TH1L. Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362) is another VGAM1928 host target gene. TIMP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:5927, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64314] Another function of VGAM1928 is therefore inhibition of Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362). Accordingly, utilities of VGAM1928 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3. Transmembrane Protein with EGF-like and Two Follistatin-like Domains 2 (TMEFF2, Accession NM\_016192) is another VGAM1928 host target gene. TMEFF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TMEFF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEFF2 BINDING SITE, designated SEQ ID:18285, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64315] Another function of VGAM1928 is therefore inhibition of Transmembrane Protein with EGF-like and Two Follistatin-like Domains 2 (TMEFF2, Accession NM\_016192), a gene which is a survival factor for hippocampal and mesencephalic neurons. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEFF2. The function of TMEFF2 has been established by previous studies. Horie et al. (2000) detected strong Tmeff2 signals in most regions of the brain including regions of the olfactory bulb,

hippocampus, cerebellum, and substantia nigra. By Northern blot analysis with whole mouse embryos, Uchida et al. (1999) found that Tmeff2 expression was detectable by embryonic day 11 and increased by embryonic days 15–17. They also observed immunostaining of Tmeff2 in adult rat mesenchymal cells of the lamina propria and fibroblasts localized in lamina propria. Uchida et al. (1999) detected both membrane-bound and soluble TMEFF2 in analysis of A172 cells. Uchida et al. (1999) found that purified, soluble TMEFF2 stimulated ERBB4, but not ERBB2 (OMIM Ref. No. 164870) or ERBB3 (OMIM Ref. No. 190151), in gastric cancer cells. By treating fetal rat primary neuron cultures with a purified recombinant TMEFF2 protein fragment, Horie et al. (2000) observed that TMEFF2 promotes the survival of hippocampal and mesencephalic, but not cortical neurons in primary culture. Adenomas are the precursors of most colorectal cancers. Hyperplastic polyps have been linked to a subset of colorectal cancers showing DNA microsatellite instability. Using a strategy that isolates differentially methylated sequences from hyperplastic polyps and normal mucosa, Young et al. (2001) identified a 370-bp sequence containing the 5-prime untranslated region and the first exon of the TM-

EFF2 gene, which they called HPP1 (hyperplastic polyposis gene-1). They used rapid amplification of cDNA ends to isolate HPP1 from normal mucosa. Using RT-PCR, they found that HPP1 was expressed in 28 of 30 (93%) normal colonic samples but in only 7 of 30 (23%) colorectal cancers (P less than 0.001). The 5-prime region of HPP1 included a CpG island containing 49 CpG sites, of which 96% were found to be methylated by bisulfite sequencing of DNA from colonic tumor samples. In situ hybridization of HPP1 indicated that expression occurs in epithelial and stromal elements in normal mucosa but is silenced in both cell types in early colonic neoplasia. HPP1 is predicted to encode a transmembrane protein containing follistatin and epidermal growth factor-like domains. Silencing of HPP1 by methylation may increase the probability of neoplastic transformation.

[64316] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64317] Horie, M.; Mitsumoto, Y.; Kyushiki, H.; Kanemoto, N.; Watanabe, A.; Taniguchi, Y.; Nishino, N.; Okamoto, T.; Kondo, M.; Mori, T.; Noguchi, K.; Nakamura, Y.; Takahashi, E.; Tanigami, A. : Identification and characterization

of TMEFF2, a novel survival factor for hippocampal and mesencephalic neurons. Genomics 67: 146–152, 2000. ; and

[64318] Young, J.; Biden, K. G.; Simms, L. A.; Huggard, P.; Karatic, R.; Eyre, H. J.; Sutherland, G. R.; Herath, N.; Barker, M.; Anderson, G. J.; Fitzpatrick, D. R.; Ramm, G. A.; Jass, J. R.,.

[64319] Further studies establishing the function and utilities of TMEFF2 are found in John Hopkins OMIM database record ID 605734, and in cited publications numbered 6918–6920 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transmembrane Protein 1 (TMEM1, Accession NM\_003274) is another VGAM1928 host target gene. TMEM1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TMEM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEM1 BINDING SITE, designated SEQ ID:9291, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64320] Another function of VGAM1928 is therefore inhibition of Transmembrane Protein 1 (TMEM1, Accession NM\_003274). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEM1. Tropomodulin 2 (neuronal) (TMOD2, Accession NM\_014548) is another VGAM1928 host target gene. TMOD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD2 BINDING SITE, designated SEQ ID:15861, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64321] Another function of VGAM1928 is therefore inhibition of Tropomodulin 2 (neuronal) (TMOD2, Accession NM\_014548), a gene which is an actin-capping protein for the slow-growing end of filamentous actin. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD2. The function of TMOD2 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM791. Triosephosphate Isomerase 1 (TPI1, Accession NM\_000365) is another VGAM1928 host target gene. TPI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TPI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPI1 BINDING SITE, designated SEQ ID:5936, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64322] Another function of VGAM1928 is therefore inhibition of Triosephosphate Isomerase 1 (TPI1, Accession NM\_000365). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPI1. Tripartite Motif-containing 37 (TRIM37, Accession NM\_015294) is another VGAM1928 host target gene. TRIM37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM37

BINDING SITE, designated SEQ ID:17619, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64323] Another function of VGAM1928 is therefore inhibition of Tripartite Motif-containing 37 (TRIM37, Accession NM\_015294). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM37. Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM\_004621) is another VGAM1928 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10971, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64324] Another function of VGAM1928 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM\_004621), a gene which has calcium channel activity. Accordingly, utilities of

VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Transient Receptor Potential Cation Channel, Subfamily M, Member 2 (TRPM2, Accession NM\_003307) is another VGAM1928 host target gene. TRPM2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM2 BINDING SITE, designated SEQ ID:9310, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64325] Another function of VGAM1928 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 2 (TRPM2, Accession NM\_003307), a gene which may be a calcium channel. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM2. The function of TRPM2 has been established by previous

studies. Perraud et al. (2001) demonstrated that a 350-amino acid protein, designated NUDT9 (OMIM Ref. No. 606022), and a homologous domain (NUDT9 homology domain) near the C terminus of the LTRPC2 putative cation channel both function as specific ADP-ribose pyrophosphatases. Whole-cell and single-channel analysis of HEK293 cells expressing LTRPC2 showed that LTRPC2 functions as a calcium-permeable cation channel that is specifically gated by free ADP-ribose. The expression of native LTRPC2 transcripts is detectable in many tissues, including the U937 monocyte cell line, in which ADP-ribose induces large cation currents that closely match those mediated by recombinant LTRPC2. Perraud et al. (2001) concluded that intracellular ADP-ribose regulates calcium entry into cells that express LTRPC2. Hara et al. (2002) reported that LTRPC2 is activated by micromolar levels of H<sub>2</sub>O<sub>2</sub> and agents that produce reactive oxygen/nitrogen species. This sensitivity of LTRPC2 to redox state modifiers was attributable to an agonistic binding of beta-nicotinamide adenine dinucleotide to the MutT motif. Arachidonic acid and calcium were important positive regulators for LTRPC2. Heterologous LTRPC2 expression conferred susceptibility to death on HEK cells. Antisense

oligonucleotide experiments revealed physiologic involvement of native LTRPC2 in H<sub>2</sub>O<sub>2</sub>- and TNF- $\alpha$  (OMIM Ref. No. 191160)-induced calcium influx and cell death. Thus, LTRPC2 represents an important intrinsic mechanism that mediates calcium and sodium overload in response to disturbance of redox state in cell death. Animal model experiments lend further support to the function of TRPM2.

[64326] It is appreciated that the abovementioned animal model for TRPM2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[64327] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64328] Perraud, A.-L.; Fleig, A.; Dunn, C. A.; Bagley, L. A.; Launay, P.; Schmitz, C.; Stokes, A. J.; Zhu, Q.; Bessman, M. J.; Penner, R.; Kinet, J.-P.; Scharenberg, A. M. : ADP-ribose gating of the calcium-permeable LTRPC2 channel revealed by Nudix motif homology. *Nature* 411: 595-599, 2001. ; and

[64329] Hara, Y.; Wakamori, M.; Ishii, M.; Maeno, E.; Nishida, M.; Yoshida, T.; Yamada, H.; Shimizu, S.; Mori, E.; Kudoh, J.; Shimizu, S.; Kurose, H.; Okada, Y.; Imoto, K.; Mori, Y. :

LTRPC2 Ca<sup>2+</sup>.

[64330] Further studies establishing the function and utilities of TRPM2 are found in John Hopkins OMIM database record ID 603749, and in cited publications numbered 7593–7598 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112) is another VGAM1928 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15350, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64331] Another function of VGAM1928 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1.

The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. WNT1 Inducible Signaling Pathway Protein 1 (WISP1, Accession NM\_003882) is another VGAM1928 host target gene. WISP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WISP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WISP1 BINDING SITE, designated SEQ ID:9961, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64332] Another function of VGAM1928 is therefore inhibition of WNT1 Inducible Signaling Pathway Protein 1 (WISP1, Accession NM\_003882), a gene which is a member of connective tissue growth factor family. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WISP1. The function of WISP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with refer-

ence to VGAM1656.Wingless-type MMTV Integration Site Family, Member 5B (WNT5B, Accession NM\_032642) is another VGAM1928 host target gene. WNT5B BINDING SITE1 and WNT5B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT5B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT5B BINDING SITE1 and WNT5B BINDING SITE2, designated SEQ ID:26359 and SEQ ID:25057 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64333] Another function of VGAM1928 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 5B (WNT5B, Accession NM\_032642), a gene which is the ligand for members of the frizzled family of seven trans-membrane receptors and may be a signaling molecule . Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT5B. The function of WNT5B has been established by previous studies. The WNT gene family consists of structurally related genes encoding secreted

signaling molecules that have been implicated in oncogenesis and in several developmental processes, including regulation of cell fate and patterning during embryogenesis. For general information about WNT genes, see WNT1 (OMIM Ref. No. 164820). Using degenerate PCR and cDNA library screening to search for new members of the mouse Wnt family, Gavin et al. (1990) identified Wnt5b. Northern blot analysis detected expression of Wnt5b in all tissues tested, with the exception of adult spleen. In situ hybridization, detected expression of Wnt5b at low levels throughout the embryo and fetus from 6.5 to 14.5 days postcoitum. By searching human genome draft sequence for mouse Wnt5a homologs, Saitoh and Katoh (2001) identified WNT5B. Using database searches and PCR techniques, they assembled a WNT5B cDNA sequence. WNT5B encodes a deduced 359-amino acid protein with an N-terminal signal peptide, 4 N-linked glycosylation sites, and conserved residues of the WNT family. The WNT5B protein shares 80% sequence identity with WNT5A (OMIM Ref. No. 164975). Using Northern blot analysis, Saitoh and Katoh (2001) detected expression of 2.8- and 2.4-kb WNT5B transcripts at moderate levels in adult prostate and fetal brain and at low levels in fetal lung, kidney,

adult liver, ovary, and small intestine. Using cDNA-PCR, the authors also detected WNT5B in gastric cancer and teratocarcinoma cell lines. Saitoh and Katoh (2001) determined that the WNT5B gene contains 4 exons and spans about 16 kb of genomic DNA. Exon-intron boundaries are conserved between WNT5B and WNT5A, suggesting that the 2 genes may have been generated by duplication of an ancestral gene.

[64334] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64335] Gavin, B. J.; McMahon, J. A.; McMahon, A. P. : Expression of multiple novel Wnt-1/int-1-related genes during fetal and adult mouse development. *Genes Dev.* 4: 2319-2332, 1990. ; and

[64336] Saitoh, T.; Katoh, M. : Molecular cloning and characterization of human WNT5B on chromosome 12p13.3 region. *Int. J. Oncol.* 19: 347-351, 2001.

[64337] Further studies establishing the function and utilities of WNT5B are found in John Hopkins OMIM database record ID 606361, and in cited publications numbered 12747 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zic Family Member

1 (odd-paired homolog, Drosophila) (ZIC1, Accession NM\_003412) is another VGAM1928 host target gene. ZIC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZIC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIC1 BINDING SITE, designated SEQ ID:9449, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64338] Another function of VGAM1928 is therefore inhibition of Zic Family Member 1 (odd-paired homolog, Drosophila) (ZIC1, Accession NM\_003412), a gene which may play a role in cerebellar development. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIC1. The function of ZIC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381. Ankyrin Repeat and BTB (POZ) Domain Containing 1 (ABTB1, Accession NM\_032548) is another VGAM1928 host target gene. ABTB1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by ABTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABTB1 BINDING SITE, designated SEQ ID:26273, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64339] Another function of VGAM1928 is therefore inhibition of Ankyrin Repeat and BTB (POZ) Domain Containing 1 (ABTB1, Accession NM\_032548). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABTB1. S-adenosylhomocysteine Hydrolase-like 1 (AHCYL1, Accession NM\_006621) is another VGAM1928 host target gene. AHCYL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AHCYL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHCYL1 BINDING SITE, designated SEQ ID:13404, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64340] Another function of VGAM1928 is therefore inhibition of S-adenosylhomocysteine Hydrolase-like 1 (AHCYL1, Accession NM\_006621). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHCYL1. Ras Homolog Gene Family, Member F (in filopodia) (ARHF, Accession NM\_019034) is another VGAM1928 host target gene. ARHF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHF BINDING SITE, designated SEQ ID:21120, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64341] Another function of VGAM1928 is therefore inhibition of Ras Homolog Gene Family, Member F (in filopodia) (ARHF, Accession NM\_019034). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHF. ARL8 (Accession XM\_167671) is another VGAM1928 host target gene. ARL8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by ARL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL8 BINDING SITE, designated SEQ ID:44761, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64342] Another function of VGAM1928 is therefore inhibition of ARL8 (Accession XM\_167671). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL8. ARNTL2 (Accession NM\_020183) is another VGAM1928 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21419, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64343] Another function of VGAM1928 is therefore inhibition of ARNTL2 (Accession NM\_020183). Accordingly, utilities of

VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. Activating Transcription Factor 3 (ATF3, Accession NM\_004024) is another VGAM1928 host target gene. ATF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF3 BINDING SITE, designated SEQ ID:10242, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64344] Another function of VGAM1928 is therefore inhibition of Activating Transcription Factor 3 (ATF3, Accession NM\_004024). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3. Butyrophilin, Subfamily 1, Member A1 (BTN1A1, Accession NM\_001732) is another VGAM1928 host target gene. BTN1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of BTN1A1 BINDING SITE, designated SEQ ID:7467, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64345] Another function of VGAM1928 is therefore inhibition of Butyrophilin, Subfamily 1, Member A1 (BTN1A1, Accession NM\_001732). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN1A1. Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM\_006995) is another VGAM1928 host target gene. BTN2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A2 BINDING SITE, designated SEQ ID:13861, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64346] Another function of VGAM1928 is therefore inhibition of Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM\_006995). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with BTN2A2. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM\_167769) is another VGAM1928 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44785, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64347] Another function of VGAM1928 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM\_167769). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. Chromosome 20 Open Reading Frame 178 (C20orf178, Accession XM\_059282) is another VGAM1928 host target gene. C20orf178 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of C20orf178 BINDING SITE, designated SEQ ID:36936, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64348] Another function of VGAM1928 is therefore inhibition of Chromosome 20 Open Reading Frame 178 (C20orf178, Accession XM\_059282). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf178. Chromosome 20 Open Reading Frame 42 (C20orf42, Accession NM\_017671) is another VGAM1928 host target gene. C20orf42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf42 BINDING SITE, designated SEQ ID:19215, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64349] Another function of VGAM1928 is therefore inhibition of Chromosome 20 Open Reading Frame 42 (C20orf42, Ac-

cession NM\_017671). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf42. Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM\_049398) is another VGAM1928 host target gene. C20orf98 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf98 BINDING SITE, designated SEQ ID:35412, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64350] Another function of VGAM1928 is therefore inhibition of Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM\_049398). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf98. Chromosome 21 Open Reading Frame 4 (C21orf4, Accession NM\_006134) is another VGAM1928 host target gene. C21orf4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

C21orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf4 BINDING SITE, designated SEQ ID:12775, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64351] Another function of VGAM1928 is therefore inhibition of Chromosome 21 Open Reading Frame 4 (C21orf4, Accession NM\_006134). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf4. Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614) is another VGAM1928 host target gene. CHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHL1 BINDING SITE, designated SEQ ID:13391, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64352] Another function of VGAM1928 is therefore inhibition of Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHL1. Chondrolectin (CHODL, Accession NM\_024944) is another VGAM1928 host target gene. CHODL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHODL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHODL BINDING SITE, designated SEQ ID:24491, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64353] Another function of VGAM1928 is therefore inhibition of Chondrolectin (CHODL, Accession NM\_024944). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHODL. CCR4-NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM\_013354) is another VGAM1928 host target gene. CNOT7 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT7 BINDING SITE, designated SEQ ID:15004, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64354] Another function of VGAM1928 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM\_013354). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT7. CXYorf1 (Accession XM\_088704) is another VGAM1928 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39915, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64355] Another function of VGAM1928 is therefore inhibition of CXYorf1 (Accession XM\_088704). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. D4ST-1 (Accession NM\_130468) is another VGAM1928 host target gene. D4ST-1 BINDING SITE1 and D4ST-1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by D4ST-1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D4ST-1 BINDING SITE1 and D4ST-1 BINDING SITE2, designated SEQ ID:28226 and SEQ ID:28229 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64356] Another function of VGAM1928 is therefore inhibition of D4ST-1 (Accession NM\_130468). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D4ST-1. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM1928 host target gene. DDX34 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16167, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64357] Another function of VGAM1928 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 37 (DDX37, Accession NM\_032656) is another VGAM1928 host target gene. DDX37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX37 BINDING SITE, designated SEQ ID:26390, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4639.

[64358] Another function of VGAM1928 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 37 (DDX37, Accession NM\_032656). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX37. DKFZP434C171 (Accession NM\_015621) is another VGAM1928 host target gene. DKFZP434C171 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434C171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C171 BINDING SITE, designated SEQ ID:17882, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64359] Another function of VGAM1928 is therefore inhibition of DKFZP434C171 (Accession NM\_015621). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C171. DKFZP434H0820 (Accession XM\_033460) is another VGAM1928 host target gene. DK–

FZP434H0820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434H0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H0820 BINDING SITE, designated SEQ ID:31933, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64360] Another function of VGAM1928 is therefore inhibition of DKFZP434H0820 (Accession XM\_033460). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H0820. DKFZp547G183 (Accession NM\_018705) is another VGAM1928 host target gene. DKFZp547G183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547G183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547G183 BINDING SITE, designated SEQ ID:20790, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4639.

[64361] Another function of VGAM1928 is therefore inhibition of DKFZp547G183 (Accession NM\_018705). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547G183. DKFZp547O146 (Accession NM\_020224) is another VGAM1928 host target gene. DKFZp547O146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547O146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547O146 BINDING SITE, designated SEQ ID:21485, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64362] Another function of VGAM1928 is therefore inhibition of DKFZp547O146 (Accession NM\_020224). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547O146. DKFZP564C1940 (Accession NM\_014045) is another VGAM1928 host target gene. DKFZP564C1940 BINDING SITE is HOST TARGET binding site

found in the 5' untranslated region of mRNA encoded by DKFZP564C1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C1940 BINDING SITE, designated SEQ ID:15272, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64363] Another function of VGAM1928 is therefore inhibition of DKFZP564C1940 (Accession NM\_014045). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C1940. DKFZp564K142 (Accession NM\_032121) is another VGAM1928 host target gene. DKFZp564K142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp564K142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp564K142 BINDING SITE, designated SEQ ID:25808, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64364] Another function of VGAM1928 is therefore inhibition of DKFZp564K142 (Accession NM\_032121). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564K142. DKFZP566K023 (Accession NM\_015485) is another VGAM1928 host target gene. DKFZP566K023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566K023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K023 BINDING SITE, designated SEQ ID:17757, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64365] Another function of VGAM1928 is therefore inhibition of DKFZP566K023 (Accession NM\_015485). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K023. DKFZp761D221 (Accession NM\_032291) is another VGAM1928 host target gene. DKFZp761D221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DKFZp761D221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D221 BINDING SITE, designated SEQ ID:26060, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64366] Another function of VGAM1928 is therefore inhibition of DKFZp761D221 (Accession NM\_032291). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D221. DKFZP761G1913 (Accession NM\_031474) is another VGAM1928 host target gene. DKFZP761G1913 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761G1913, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761G1913 BINDING SITE, designated SEQ ID:25546, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64367] Another function of VGAM1928 is therefore inhibition of

DKFZP761G1913 (Accession NM\_031474). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761G1913. DKFZp761N0624 (Accession NM\_032295) is another VGAM1928 host target gene. DKFZp761N0624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761N0624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N0624 BINDING SITE, designated SEQ ID:26075, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64368] Another function of VGAM1928 is therefore inhibition of DKFZp761N0624 (Accession NM\_032295). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N0624. DKFZp762A227 (Accession NM\_017611) is another VGAM1928 host target gene. DKFZp762A227 BINDING SITE1 and DKFZp762A227 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZp762A227, corre-

sponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762A227 BINDING SITE1 and DKFZp762A227 BINDING SITE2, designated SEQ ID:19105 and SEQ ID:15316 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64369] Another function of VGAM1928 is therefore inhibition of DKFZp762A227 (Accession NM\_017611). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762A227. F-box Only Protein 27 (FBXO27, Accession XM\_059045) is another VGAM1928 host target gene. FBXO27 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO27 BINDING SITE, designated SEQ ID:36837, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64370] Another function of VGAM1928 is therefore inhibition of F-box Only Protein 27 (FBXO27, Accession XM\_059045). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO27. FLJ10458 (Accession NM\_018096) is another VGAM1928 host target gene. FLJ10458 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10458 BINDING SITE, designated SEQ ID:19865, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64371] Another function of VGAM1928 is therefore inhibition of FLJ10458 (Accession NM\_018096). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10458. FLJ10460 (Accession NM\_018097) is another VGAM1928 host target gene. FLJ10460 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10460, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10460 BINDING SITE, designated SEQ ID:19869, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64372] Another function of VGAM1928 is therefore inhibition of FLJ10460 (Accession NM\_018097). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10460. FLJ10468 (Accession NM\_018101) is another VGAM1928 host target gene. FLJ10468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10468 BINDING SITE, designated SEQ ID:19874, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64373] Another function of VGAM1928 is therefore inhibition of FLJ10468 (Accession NM\_018101). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10468. FLJ10830 (Accession NM\_018235) is another VGAM1928 host target gene. FLJ10830 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10830 BINDING SITE, designated SEQ ID:20182, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64374] Another function of VGAM1928 is therefore inhibition of FLJ10830 (Accession NM\_018235). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10830. FLJ10956 (Accession NM\_018283) is another VGAM1928 host target gene. FLJ10956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10956 BINDING SITE, designated SEQ ID:20273, to the nucleotide

sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64375] Another function of VGAM1928 is therefore inhibition of FLJ10956 (Accession NM\_018283). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10956. FLJ11126 (Accession NM\_018332) is another VGAM1928 host target gene. FLJ11126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11126 BINDING SITE, designated SEQ ID:20334, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64376] Another function of VGAM1928 is therefore inhibition of FLJ11126 (Accession NM\_018332). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11126. FLJ11136 (Accession NM\_018336) is another VGAM1928 host target gene. FLJ11136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ11136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11136 BINDING SITE, designated SEQ ID:20339, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64377] Another function of VGAM1928 is therefore inhibition of FLJ11136 (Accession NM\_018336). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11136. FLJ11186 (Accession NM\_018353) is another VGAM1928 host target gene. FLJ11186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11186 BINDING SITE, designated SEQ ID:20367, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64378] Another function of VGAM1928 is therefore inhibition of FLJ11186 (Accession NM\_018353). Accordingly, utilities of

VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11186. FLJ11301 (Accession NM\_018385) is another VGAM1928 host target gene. FLJ11301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11301 BINDING SITE, designated SEQ ID:20417, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64379] Another function of VGAM1928 is therefore inhibition of FLJ11301 (Accession NM\_018385). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11301. FLJ11726 (Accession NM\_024971) is another VGAM1928 host target gene. FLJ11726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11726

BINDING SITE, designated SEQ ID:24528, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64380] Another function of VGAM1928 is therefore inhibition of FLJ11726 (Accession NM\_024971). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11726. FLJ12122 (Accession NM\_024979) is another VGAM1928 host target gene. FLJ12122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12122 BINDING SITE, designated SEQ ID:24540, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64381] Another function of VGAM1928 is therefore inhibition of FLJ12122 (Accession NM\_024979). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12122. FLJ12484 (Accession XM\_045681) is another VGAM1928 host target gene. FLJ12484 BINDING SITE1 and

FLJ12484 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12484, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2, designated SEQ ID:34521 and SEQ ID:23023 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64382] Another function of VGAM1928 is therefore inhibition of FLJ12484 (Accession XM\_045681). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12484. FLJ13241 (Accession NM\_025088) is another VGAM1928 host target gene. FLJ13241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13241 BINDING SITE, designated SEQ ID:24709, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM

RNA, also designated SEQ ID:4639.

[64383] Another function of VGAM1928 is therefore inhibition of FLJ13241 (Accession NM\_025088). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13241. FLJ13912 (Accession NM\_022770) is another VGAM1928 host target gene. FLJ13912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13912 BINDING SITE, designated SEQ ID:23028, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64384] Another function of VGAM1928 is therefore inhibition of FLJ13912 (Accession NM\_022770). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13912. FLJ14327 (Accession NM\_024912) is another VGAM1928 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14327, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24421, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64385] Another function of VGAM1928 is therefore inhibition of FLJ14327 (Accession NM\_024912). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327. FLJ14490 (Accession NM\_032793) is another VGAM1928 host target gene. FLJ14490 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14490 BINDING SITE, designated SEQ ID:26546, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64386] Another function of VGAM1928 is therefore inhibition of FLJ14490 (Accession NM\_032793). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14490. FLJ20069 (Accession NM\_017651) is another VGAM1928 host target gene. FLJ20069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20069 BINDING SITE, designated SEQ ID:19156, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64387] Another function of VGAM1928 is therefore inhibition of FLJ20069 (Accession NM\_017651). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20069. FLJ20085 (Accession NM\_017660) is another VGAM1928 host target gene. FLJ20085 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20085 BINDING SITE, designated SEQ ID:19184, to the nucleotide

sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64388] Another function of VGAM1928 is therefore inhibition of FLJ20085 (Accession NM\_017660). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20085. FLJ20584 (Accession NM\_017891) is another VGAM1928 host target gene. FLJ20584 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20584 BINDING SITE, designated SEQ ID:19561, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64389] Another function of VGAM1928 is therefore inhibition of FLJ20584 (Accession NM\_017891). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20584. FLJ20666 (Accession NM\_017922) is another VGAM1928 host target gene. FLJ20666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ20666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE, designated SEQ ID:19585, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64390] Another function of VGAM1928 is therefore inhibition of FLJ20666 (Accession NM\_017922). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666. FLJ21324 (Accession XM\_165988) is another VGAM1928 host target gene. FLJ21324 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21324, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21324 BINDING SITE, designated SEQ ID:43830, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64391] Another function of VGAM1928 is therefore inhibition of FLJ21324 (Accession XM\_165988). Accordingly, utilities of

VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21324. FLJ21977 (Accession NM\_032213) is another VGAM1928 host target gene. FLJ21977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21977 BINDING SITE, designated SEQ ID:25940, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64392] Another function of VGAM1928 is therefore inhibition of FLJ21977 (Accession NM\_032213). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21977. FLJ22202 (Accession NM\_024883) is another VGAM1928 host target gene. FLJ22202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22202

BINDING SITE, designated SEQ ID:24335, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64393] Another function of VGAM1928 is therefore inhibition of FLJ22202 (Accession NM\_024883). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22202. FLJ22215 (Accession XM\_173021) is another VGAM1928 host target gene. FLJ22215 BINDING SITE1 and FLJ22215 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ22215, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE1 and FLJ22215 BINDING SITE2, designated SEQ ID:46279 and SEQ ID:23116 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64394] Another function of VGAM1928 is therefore inhibition of FLJ22215 (Accession XM\_173021). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22215. FLJ22494 (Accession NM\_024815) is another VGAM1928 host target gene. FLJ22494 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22494 BINDING SITE, designated SEQ ID:24202, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64395] Another function of VGAM1928 is therefore inhibition of FLJ22494 (Accession NM\_024815). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22494. FLJ22529 (Accession NM\_024789) is another VGAM1928 host target gene. FLJ22529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22529 BINDING SITE, designated SEQ ID:24169, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM

RNA, also designated SEQ ID:4639.

[64396] Another function of VGAM1928 is therefore inhibition of FLJ22529 (Accession NM\_024789). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22529. FLJ22746 (Accession NM\_024785) is another VGAM1928 host target gene. FLJ22746 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22746 BINDING SITE, designated SEQ ID:24163, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64397] Another function of VGAM1928 is therefore inhibition of FLJ22746 (Accession NM\_024785). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22746. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM\_054016) is another VGAM1928 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by FUSIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ ID:27623, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64398] Another function of VGAM1928 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM\_054016). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. GBL (Accession NM\_022372) is another VGAM1928 host target gene. GBL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBL BINDING SITE, designated SEQ ID:22760, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64399] Another function of VGAM1928 is therefore inhibition of

GBL (Accession NM\_022372). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBL. GEMIN7 (Accession NM\_024707) is another VGAM1928 host target gene. GEMIN7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GEMIN7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GEMIN7 BINDING SITE, designated SEQ ID:24024, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64400] Another function of VGAM1928 is therefore inhibition of GEMIN7 (Accession NM\_024707). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GEMIN7. Glutamine-fructose-6-phosphate Transaminase 1 (GFPT1, Accession NM\_002056) is another VGAM1928 host target gene. GFPT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFPT1 BINDING SITE, designated SEQ ID:7818, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64401] Another function of VGAM1928 is therefore inhibition of Glutamine-fructose-6-phosphate Transaminase 1 (GFPT1, Accession NM\_002056). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFPT1. G Protein Pathway Suppressor 2 (GPS2, Accession XM\_102749) is another VGAM1928 host target gene. GPS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPS2 BINDING SITE, designated SEQ ID:42147, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64402] Another function of VGAM1928 is therefore inhibition of G Protein Pathway Suppressor 2 (GPS2, Accession XM\_102749). Accordingly, utilities of VGAM1928 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM\_133443) is another VGAM1928 host target gene. GPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:28522, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64403] Another function of VGAM1928 is therefore inhibition of Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM\_133443). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445) is another VGAM1928 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28530, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64404] Another function of VGAM1928 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. GRO2 (Accession XM\_003510) is another VGAM1928 host target gene. GRO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRO2 BINDING SITE, designated SEQ ID:29937, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64405] Another function of VGAM1928 is therefore inhibition of GRO2 (Accession XM\_003510). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GRO2. Hypermethylated In Cancer 2 (HIC2, Accession XM\_036937) is another VGAM1928 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32523, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64406] Another function of VGAM1928 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM\_036937). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. HSC3 (Accession NM\_145174) is another VGAM1928 host target gene. HSC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSC3 BINDING SITE, designated SEQ ID:29734,

to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64407] Another function of VGAM1928 is therefore inhibition of HSC3 (Accession NM\_145174). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSC3. HSPC067 (Accession NM\_014158) is another VGAM1928 host target gene. HSPC067 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC067, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC067 BINDING SITE, designated SEQ ID:15458, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64408] Another function of VGAM1928 is therefore inhibition of HSPC067 (Accession NM\_014158). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC067. HSPC073 (Accession NM\_014163) is another VGAM1928 host target gene. HSPC073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by HSPC073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC073 BINDING SITE, designated SEQ ID:15461, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64409] Another function of VGAM1928 is therefore inhibition of HSPC073 (Accession NM\_014163). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC073. HSPC156 (Accession NM\_014178) is another VGAM1928 host target gene. HSPC156 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC156 BINDING SITE, designated SEQ ID:15464, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64410] Another function of VGAM1928 is therefore inhibition of HSPC156 (Accession NM\_014178). Accordingly, utilities of

VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC156. HUMZD58C02 (Accession XM\_086862) is another VGAM1928 host target gene. HUMZD58C02 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HUMZD58C02, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUMZD58C02 BINDING SITE, designated SEQ ID:38930, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64411] Another function of VGAM1928 is therefore inhibition of HUMZD58C02 (Accession XM\_086862). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMZD58C02. IMAGE:4907098 (Accession XM\_166247) is another VGAM1928 host target gene. IMAGE:4907098 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMAGE:4907098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMAGE:4907098 BINDING SITE, designated SEQ ID:44058, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64412] Another function of VGAM1928 is therefore inhibition of IMAGE:4907098 (Accession XM\_166247). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMAGE:4907098. JDD1 (Accession XM\_032515) is another VGAM1928 host target gene. JDD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JDD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JDD1 BINDING SITE, designated SEQ ID:31669, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64413] Another function of VGAM1928 is therefore inhibition of JDD1 (Accession XM\_032515). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JDD1.

Potassium Voltage-gated Channel, Isk-related Family, Member 4 (KCNE4, Accession NM\_080671) is another VGAM1928 host target gene. KCNE4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNE4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNE4 BINDING SITE, designated SEQ ID:27969, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64414] Another function of VGAM1928 is therefore inhibition of Potassium Voltage-gated Channel, Isk-related Family, Member 4 (KCNE4, Accession NM\_080671). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNE4. KIAA0205 (Accession NM\_014873) is another VGAM1928 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0205 BINDING SITE, designated SEQ ID:17008, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64415] Another function of VGAM1928 is therefore inhibition of KIAA0205 (Accession NM\_014873). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205. KIAA0323 (Accession XM\_032634) is another VGAM1928 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31696, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64416] Another function of VGAM1928 is therefore inhibition of KIAA0323 (Accession XM\_032634). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA0332 (Accession XM\_031553) is another VGAM1928 host target gene. KIAA0332 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31418, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64417] Another function of VGAM1928 is therefore inhibition of KIAA0332 (Accession XM\_031553). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. KIAA0335 (Accession NM\_014803) is another VGAM1928 host target gene. KIAA0335 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0335 BINDING SITE, designated SEQ ID:16729, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64418] Another function of VGAM1928 is therefore inhibition of

KIAA0335 (Accession NM\_014803). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0335. KIAA0376 (Accession XM\_037759) is another VGAM1928 host target gene. KIAA0376 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0376 BINDING SITE, designated SEQ ID:32675, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64419] Another function of VGAM1928 is therefore inhibition of KIAA0376 (Accession XM\_037759). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0376. KIAA0450 (Accession NM\_014638) is another VGAM1928 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16030, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64420] Another function of VGAM1928 is therefore inhibition of KIAA0450 (Accession NM\_014638). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0478 (Accession NM\_014870) is another VGAM1928 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16982, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64421] Another function of VGAM1928 is therefore inhibition of KIAA0478 (Accession NM\_014870). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA0495 (Accession XM\_031397) is another

VGAM1928 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31355, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64422] Another function of VGAM1928 is therefore inhibition of KIAA0495 (Accession XM\_031397). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA0514 (Accession NM\_014696) is another VGAM1928 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16203, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64423] Another function of VGAM1928 is therefore inhibition of KIAA0514 (Accession NM\_014696). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA0523 (Accession XM\_041964) is another VGAM1928 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33648, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64424] Another function of VGAM1928 is therefore inhibition of KIAA0523 (Accession XM\_041964). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. KIAA0685 (Accession NM\_014678) is another VGAM1928 host target gene. KIAA0685 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0685, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0685 BINDING SITE, designated SEQ ID:16148, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64425] Another function of VGAM1928 is therefore inhibition of KIAA0685 (Accession NM\_014678). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0685. KIAA0720 (Accession XM\_030970) is another VGAM1928 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31235, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64426] Another function of VGAM1928 is therefore inhibition of KIAA0720 (Accession XM\_030970). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0720. KIAA0961 (Accession NM\_014898) is another VGAM1928 host target gene. KIAA0961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0961 BINDING SITE, designated SEQ ID:17072, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64427] Another function of VGAM1928 is therefore inhibition of KIAA0961 (Accession NM\_014898). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0961. KIAA1001 (Accession NM\_014960) is another VGAM1928 host target gene. KIAA1001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1001 BINDING SITE, designated SEQ ID:17324, to the nucleotide sequence of VGAM1928 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4639.

[64428] Another function of VGAM1928 is therefore inhibition of KIAA1001 (Accession NM\_014960). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1001. KIAA1018 (Accession NM\_014967) is another VGAM1928 host target gene. KIAA1018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1018 BINDING SITE, designated SEQ ID:17355, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64429] Another function of VGAM1928 is therefore inhibition of KIAA1018 (Accession NM\_014967). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1018. KIAA1023 (Accession NM\_017604) is another VGAM1928 host target gene. KIAA1023 BINDING SITE1 through KIAA1023 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded

by KIAA1023, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE1 through KIAA1023 BINDING SITE3, designated SEQ ID:19097, SEQ ID:19095 and SEQ ID:19096 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64430] Another function of VGAM1928 is therefore inhibition of KIAA1023 (Accession NM\_017604). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1036 (Accession NM\_014909) is another VGAM1928 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17130, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64431] Another function of VGAM1928 is therefore inhibition of

KIAA1036 (Accession NM\_014909). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. KIAA1161 (Accession XM\_088501) is another VGAM1928 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39747, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64432] Another function of VGAM1928 is therefore inhibition of KIAA1161 (Accession XM\_088501). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. KIAA1170 (Accession XM\_045907) is another VGAM1928 host target gene. KIAA1170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:34614, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64433] Another function of VGAM1928 is therefore inhibition of KIAA1170 (Accession XM\_045907). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170. KIAA1183 (Accession XM\_031307) is another VGAM1928 host target gene. KIAA1183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1183 BINDING SITE, designated SEQ ID:31336, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64434] Another function of VGAM1928 is therefore inhibition of KIAA1183 (Accession XM\_031307). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1183. KIAA1233 (Accession XM\_032181) is another

VGAM1928 host target gene. KIAA1233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1233 BINDING SITE, designated SEQ ID:31592, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64435] Another function of VGAM1928 is therefore inhibition of KIAA1233 (Accession XM\_032181). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1233. KIAA1466 (Accession XM\_050285) is another VGAM1928 host target gene. KIAA1466 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1466 BINDING SITE, designated SEQ ID:35603, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64436] Another function of VGAM1928 is therefore inhibition of KIAA1466 (Accession XM\_050285). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1466. KIAA1656 (Accession XM\_038022) is another VGAM1928 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32726, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64437] Another function of VGAM1928 is therefore inhibition of KIAA1656 (Accession XM\_038022). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. KIAA1691 (Accession XM\_166523) is another VGAM1928 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44463, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64438] Another function of VGAM1928 is therefore inhibition of KIAA1691 (Accession XM\_166523). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. KIAA1913 (Accession XM\_058167) is another VGAM1928 host target gene. KIAA1913 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1913, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1913 BINDING SITE, designated SEQ ID:36578, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64439] Another function of VGAM1928 is therefore inhibition of KIAA1913 (Accession XM\_058167). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1913. Lectin, Galactoside-binding, Soluble, 8 (galectin 8) (LGALS8, Accession NM\_006499) is another VGAM1928 host target gene. LGALS8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LGALS8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGALS8 BINDING SITE, designated SEQ ID:13246, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64440] Another function of VGAM1928 is therefore inhibition of Lectin, Galactoside-binding, Soluble, 8 (galectin 8) (LGALS8, Accession NM\_006499). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGALS8. LIN-28 (Accession NM\_024674) is another VGAM1928 host target gene. LIN-28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIN-28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIN-28 BIND-

ING SITE, designated SEQ ID:23982, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64441] Another function of VGAM1928 is therefore inhibition of LIN-28 (Accession NM\_024674). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN-28. Methyl-CpG Binding Domain Protein 2 (MBD2, Accession NM\_015832) is another VGAM1928 host target gene. MBD2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MBD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD2 BINDING SITE, designated SEQ ID:17945, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64442] Another function of VGAM1928 is therefore inhibition of Methyl-CpG Binding Domain Protein 2 (MBD2, Accession NM\_015832). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD2. MGC10960 (Accession NM\_032653) is another VGAM1928 host target

gene. MGC10960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10960 BINDING SITE, designated SEQ ID:26382, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64443] Another function of VGAM1928 is therefore inhibition of MGC10960 (Accession NM\_032653). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10960. MGC20496 (Accession NM\_052845) is another VGAM1928 host target gene. MGC20496 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20496 BINDING SITE, designated SEQ ID:27424, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64444] Another function of VGAM1928 is therefore inhibition of MGC20496 (Accession NM\_052845). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20496. MGC2474 (Accession NM\_023931) is another VGAM1928 host target gene. MGC2474 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:23419, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64445] Another function of VGAM1928 is therefore inhibition of MGC2474 (Accession NM\_023931). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474. MGC2628 (Accession NM\_024076) is another VGAM1928 host target gene. MGC2628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2628, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2628 BINDING SITE, designated SEQ ID:23510, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64446] Another function of VGAM1928 is therefore inhibition of MGC2628 (Accession NM\_024076). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2628. MGC26641 (Accession NM\_144971) is another VGAM1928 host target gene. MGC26641 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC26641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26641 BINDING SITE, designated SEQ ID:29585, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64447] Another function of VGAM1928 is therefore inhibition of MGC26641 (Accession NM\_144971). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC26641. MGC2752 (Accession XM\_085842) is another VGAM1928 host target gene. MGC2752 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2752 BINDING SITE, designated SEQ ID:38368, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64448] Another function of VGAM1928 is therefore inhibition of MGC2752 (Accession XM\_085842). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2752. MGC35521 (Accession NM\_145065) is another VGAM1928 host target gene. MGC35521 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35521 BINDING SITE, designated SEQ ID:29704, to the nucleotide sequence of VGAM1928 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4639.

[64449] Another function of VGAM1928 is therefore inhibition of MGC35521 (Accession NM\_145065). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35521. MGC4677 (Accession NM\_052871) is another VGAM1928 host target gene. MGC4677 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4677 BINDING SITE, designated SEQ ID:27450, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64450] Another function of VGAM1928 is therefore inhibition of MGC4677 (Accession NM\_052871). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4677. MGC7036 (Accession NM\_145058) is another VGAM1928 host target gene. MGC7036 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC7036, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC7036 BINDING SITE, designated SEQ ID:29693, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64451] Another function of VGAM1928 is therefore inhibition of MGC7036 (Accession NM\_145058). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC7036. MGC9753 (Accession NM\_033419) is another VGAM1928 host target gene. MGC9753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC9753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9753 BINDING SITE, designated SEQ ID:27246, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64452] Another function of VGAM1928 is therefore inhibition of MGC9753 (Accession NM\_033419). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC9753. MIG (Accession NM\_002416) is another VGAM1928 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, designated SEQ ID:8250, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64453] Another function of VGAM1928 is therefore inhibition of MIG (Accession NM\_002416). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM\_016622) is another VGAM1928 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ

ID:18736, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64454] Another function of VGAM1928 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM\_016622). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM\_015084) is another VGAM1928 host target gene. MRPS27 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPS27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS27 BINDING SITE, designated SEQ ID:17474, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64455] Another function of VGAM1928 is therefore inhibition of Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM\_015084). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS27. Neuroblastoma,

Suppression of Tumorigenicity 1 (NBL1, Accession XM\_001434) is another VGAM1928 host target gene. NBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBL1 BINDING SITE, designated SEQ ID:29840, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64456] Another function of VGAM1928 is therefore inhibition of Neuroblastoma, Suppression of Tumorigenicity 1 (NBL1, Accession XM\_001434). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBL1. NCK Adaptor Protein 1 (NCK1, Accession NM\_006153) is another VGAM1928 host target gene. NCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCK1 BINDING SITE, designated SEQ ID:12811, to the nucleotide se-

quence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64457] Another function of VGAM1928 is therefore inhibition of NCK Adaptor Protein 1 (NCK1, Accession NM\_006153). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCK1. NKX2C (Accession NM\_145285) is another VGAM1928 host target gene. NKX2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKX2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX2C BINDING SITE, designated SEQ ID:29802, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64458] Another function of VGAM1928 is therefore inhibition of NKX2C (Accession NM\_145285). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX2C. Obscurin, Cytoskeletal Calmodulin and Titin-interacting RhoGEF (OBSCN, Accession XM\_047536) is another

VGAM1928 host target gene. OBSCN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OBSCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBSCN BINDING SITE, designated SEQ ID:34988, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64459] Another function of VGAM1928 is therefore inhibition of Obscurin, Cytoskeletal Calmodulin and Titin-interacting RhoGEF (OBSCN, Accession XM\_047536). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBSCN. ORM1-like 2 (*S. cerevisiae*) (ORMDL2, Accession NM\_014182) is another VGAM1928 host target gene. ORMDL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ORMDL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORMDL2 BINDING SITE, designated SEQ ID:15468, to the nucleotide sequence of VGAM1928 RNA,

herein designated VGAM RNA, also designated SEQ ID:4639.

[64460] Another function of VGAM1928 is therefore inhibition of ORM1-like 2 (*S. cerevisiae*) (ORMDL2, Accession NM\_014182). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORMDL2. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM\_020841) is another VGAM1928 host target gene. OSBPL8 BINDING SITE1 and OSBPL8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE1 and OSBPL8 BINDING SITE2, designated SEQ ID:21904 and SEQ ID:21905 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64461] Another function of VGAM1928 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM\_020841). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with OSBPL8. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM\_014644) is another VGAM1928 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4DIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:16053, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64462] Another function of VGAM1928 is therefore inhibition of Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM\_014644). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. PEPP3 (Accession NM\_014935) is another VGAM1928 host target gene. PEPP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of PEPP3 BINDING SITE, designated SEQ ID:17237, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64463] Another function of VGAM1928 is therefore inhibition of PEPP3 (Accession NM\_014935). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEPP3. PIP3-E (Accession XM\_039749) is another VGAM1928 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33183, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64464] Another function of VGAM1928 is therefore inhibition of PIP3-E (Accession XM\_039749). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. Protein-O-mannosyltransferase 1 (POMT1, Accession

NM\_007171) is another VGAM1928 host target gene. POMT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POMT1 BINDING SITE, designated SEQ ID:14017, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64465] Another function of VGAM1928 is therefore inhibition of Protein-O-mannosyltransferase 1 (POMT1, Accession NM\_007171). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMT1. Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM\_046751) is another VGAM1928 host target gene. PPFIA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPFIA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of PPFIA4 BINDING SITE, designated SEQ ID:34818, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64466] Another function of VGAM1928 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM\_046751). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIA4. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 14A (PPP1R14A, Accession NM\_033256) is another VGAM1928 host target gene. PPP1R14A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPP1R14A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R14A BINDING SITE, designated SEQ ID:27088, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64467] Another function of VGAM1928 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 14A

(PPP1R14A, Accession NM\_033256). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R14A. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607) is another VGAM1928 host target gene. PPP1R3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:23854, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64468] Another function of VGAM1928 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B. PRO0659 (Accession NM\_014138) is another VGAM1928 host target gene. PRO0659 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0659, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0659 BINDING SITE, designated SEQ ID:15408, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64469] Another function of VGAM1928 is therefore inhibition of PRO0659 (Accession NM\_014138). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0659. PRO1855 (Accession NM\_018509) is another VGAM1928 host target gene. PRO1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1855 BINDING SITE, designated SEQ ID:20576, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64470] Another function of VGAM1928 is therefore inhibition of PRO1855 (Accession NM\_018509). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRO1855. PRO2730 (Accession NM\_025222) is another VGAM1928 host target gene. PRO2730 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2730 BINDING SITE, designated SEQ ID:24898, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64471] Another function of VGAM1928 is therefore inhibition of PRO2730 (Accession NM\_025222). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2730. RAB, Member of RAS Oncogene Family-like 4 (RABL4, Accession NM\_006860) is another VGAM1928 host target gene. RABL4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RABL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABL4 BINDING SITE, des-

ignated SEQ ID:13728, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64472] Another function of VGAM1928 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 4 (RABL4, Accession NM\_006860). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL4. Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM\_019055) is another VGAM1928 host target gene. ROBO4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROBO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO4 BINDING SITE, designated SEQ ID:21132, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64473] Another function of VGAM1928 is therefore inhibition of Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM\_019055). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ROBO4. RPP14 (Accession XM\_003044) is another VGAM1928 host target gene. RPP14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPP14 BINDING SITE, designated SEQ ID:29925, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64474] Another function of VGAM1928 is therefore inhibition of RPP14 (Accession XM\_003044). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP14. SBB103 (Accession NM\_005785) is another VGAM1928 host target gene. SBB103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SBB103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBB103 BINDING SITE, designated SEQ ID:12366, to the nucleotide sequence of

VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64475] Another function of VGAM1928 is therefore inhibition of SBB103 (Accession NM\_005785). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBB103. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM1928 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16076, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64476] Another function of VGAM1928 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. Syndecan Binding Protein (syntenin) (SDCBP, Accession NM\_005625) is another VGAM1928 host target gene. SDCBP BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by SDCBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCBP BINDING SITE, designated SEQ ID:12136, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64477] Another function of VGAM1928 is therefore inhibition of Syndecan Binding Protein (syntenin) (SDCBP, Accession NM\_005625). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCBP. Serologically Defined Colon Cancer Antigen 1 (SDCCAG1, Accession NM\_004713) is another VGAM1928 host target gene. SDCCAG1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SDCCAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG1 BINDING SITE, designated SEQ ID:11072, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ

ID:4639.

[64478] Another function of VGAM1928 is therefore inhibition of Serologically Defined Colon Cancer Antigen 1 (SDCCAG1, Accession NM\_004713). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SD-CCAG1. SES2 (Accession NM\_031459) is another VGAM1928 host target gene. SES2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SES2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SES2 BINDING SITE, designated SEQ ID:25481, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64479] Another function of VGAM1928 is therefore inhibition of SES2 (Accession NM\_031459). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SES2. SIPL (Accession NM\_018269) is another VGAM1928 host target gene. SIPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by SIPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIPL BINDING SITE, designated SEQ ID:20242, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64480] Another function of VGAM1928 is therefore inhibition of SIPL (Accession NM\_018269). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIPL. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM\_000617) is another VGAM1928 host target gene. SLC11A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC11A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:6225, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64481] Another function of VGAM1928 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM\_000617). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2. SMC4 Structural Maintenance of Chromosomes 4-like 1 (yeast) (SMC4L1, Accession NM\_005496) is another VGAM1928 host target gene. SMC4L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMC4L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMC4L1 BINDING SITE, designated SEQ ID:12001, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64482] Another function of VGAM1928 is therefore inhibition of SMC4 Structural Maintenance of Chromosomes 4-like 1 (yeast) (SMC4L1, Accession NM\_005496). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMC4L1. Serine Palmitoyltransferase, Long Chain

Base Subunit 2 (SPTLC2, Accession NM\_004863) is another VGAM1928 host target gene. SPTLC2 BINDING SITE1 and SPTLC2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SPTLC2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE1 and SPTLC2 BINDING SITE2, designated SEQ ID:11286 and SEQ ID:11285 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64483] Another function of VGAM1928 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. Synaptotagmin XIII (SYT13, Accession XM\_167880) is another VGAM1928 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:44888, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64484] Another function of VGAM1928 is therefore inhibition of Synaptotagmin XIII (SYT13, Accession XM\_167880). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. TAF5-like RNA Polymerase II, P300/CBP-associated Factor (PCAF)-associated Factor, 65kDa (TAF5L, Accession NM\_014409) is another VGAM1928 host target gene. TAF5L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF5L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF5L BINDING SITE, designated SEQ ID:15751, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64485] Another function of VGAM1928 is therefore inhibition of TAF5-like RNA Polymerase II, P300/CBP-associated Factor

(PCAF)-associated Factor, 65kDa (TAF5L, Accession NM\_014409). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF5L. TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM\_021809) is another VGAM1928 host target gene. TGIF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGIF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:22364, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64486] Another function of VGAM1928 is therefore inhibition of TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM\_021809). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2. Thioesterase, Adipose Associated (THEA, Accession XM\_038922) is another VGAM1928 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THEA,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32949, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64487] Another function of VGAM1928 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM\_038922). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. Translocation Protein 1 (TLOC1, Accession NM\_003262) is another VGAM1928 host target gene. TLOC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TLOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLOC1 BINDING SITE, designated SEQ ID:9274, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64488] Another function of VGAM1928 is therefore inhibition of Translocation Protein 1 (TLOC1, Accession NM\_003262).

Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLOC1. Trinucleotide Repeat Containing 5 (TNRC5, Accession NM\_006586) is another VGAM1928 host target gene. TNRC5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TNRC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC5 BINDING SITE, designated SEQ ID:13345, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64489] Another function of VGAM1928 is therefore inhibition of Trinucleotide Repeat Containing 5 (TNRC5, Accession NM\_006586). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC5. TNF Receptor-associated Factor 3 (TRAF3, Accession XM\_007256) is another VGAM1928 host target gene. TRAF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:30041, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64490] Another function of VGAM1928 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM\_007256). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. Tubby Homolog (mouse) (TUB, Accession NM\_003320) is another VGAM1928 host target gene. TUB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUB BINDING SITE, designated SEQ ID:9320, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64491] Another function of VGAM1928 is therefore inhibition of Tubby Homolog (mouse) (TUB, Accession NM\_003320). Accordingly, utilities of VGAM1928 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with TUB. Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106) is another VGAM1928 host target gene. YAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YAP1 BINDING SITE, designated SEQ ID:12751, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64492] Another function of VGAM1928 is therefore inhibition of Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1. Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM\_053023) is another VGAM1928 host target gene. ZFP91 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP91, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ZFP91 BINDING SITE, designated SEQ ID:27577, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64493] Another function of VGAM1928 is therefore inhibition of Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM\_053023). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91. Zinc Finger Protein 304 (ZNF304, Accession NM\_020657) is another VGAM1928 host target gene. ZNF304 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF304, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF304 BINDING SITE, designated SEQ ID:21831, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64494] Another function of VGAM1928 is therefore inhibition of Zinc Finger Protein 304 (ZNF304, Accession NM\_020657). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with ZNF304. ZNF333 (Accession NM\_032433) is another VGAM1928 host target gene. ZNF333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF333 BINDING SITE, designated SEQ ID:26203, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64495] Another function of VGAM1928 is therefore inhibition of ZNF333 (Accession NM\_032433). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF333. Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM\_166119) is another VGAM1928 host target gene. ZNF33A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF33A BINDING SITE, designated SEQ

ID:43900, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64496] Another function of VGAM1928 is therefore inhibition of Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM\_166119). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF33A. ZNF340 (Accession XM\_097701) is another VGAM1928 host target gene. ZNF340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF340 BINDING SITE, designated SEQ ID:41035, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64497] Another function of VGAM1928 is therefore inhibition of ZNF340 (Accession XM\_097701). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF340. LOC115574 (Accession XM\_056240) is another

VGAM1928 host target gene. LOC115574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115574 BINDING SITE, designated SEQ ID:36368, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64498] Another function of VGAM1928 is therefore inhibition of LOC115574 (Accession XM\_056240). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115574. LOC116228 (Accession XM\_057659) is another VGAM1928 host target gene. LOC116228 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC116228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116228 BINDING SITE, designated SEQ ID:36535, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64499] Another function of VGAM1928 is therefore inhibition of LOC116228 (Accession XM\_057659). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116228. LOC124044 (Accession XM\_071871) is another VGAM1928 host target gene. LOC124044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124044 BINDING SITE, designated SEQ ID:37430, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64500] Another function of VGAM1928 is therefore inhibition of LOC124044 (Accession XM\_071871). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124044. LOC126006 (Accession XM\_058956) is another VGAM1928 host target gene. LOC126006 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126006, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126006 BINDING SITE, designated SEQ ID:36802, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64501] Another function of VGAM1928 is therefore inhibition of LOC126006 (Accession XM\_058956). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126006. LOC130497 (Accession XM\_059439) is another VGAM1928 host target gene. LOC130497 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130497 BINDING SITE, designated SEQ ID:36991, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64502] Another function of VGAM1928 is therefore inhibition of LOC130497 (Accession XM\_059439). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC130497. LOC130589 (Accession NM\_138801) is another VGAM1928 host target gene. LOC130589 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130589 BINDING SITE, designated SEQ ID:29022, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64503] Another function of VGAM1928 is therefore inhibition of LOC130589 (Accession NM\_138801). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130589. LOC130612 (Accession XM\_059461) is another VGAM1928 host target gene. LOC130612 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130612 BINDING SITE, designated SEQ ID:37000, to the nucleotide sequence of VGAM1928 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4639.

[64504] Another function of VGAM1928 is therefore inhibition of LOC130612 (Accession XM\_059461). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130612. LOC132299 (Accession XM\_059584) is another VGAM1928 host target gene. LOC132299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC132299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132299 BINDING SITE, designated SEQ ID:37024, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64505] Another function of VGAM1928 is therefore inhibition of LOC132299 (Accession XM\_059584). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132299. LOC133362 (Accession XM\_068305) is another VGAM1928 host target gene. LOC133362 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC133362, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133362 BINDING SITE, designated SEQ ID:37378, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64506] Another function of VGAM1928 is therefore inhibition of LOC133362 (Accession XM\_068305). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133362. LOC137075 (Accession XM\_059895) is another VGAM1928 host target gene. LOC137075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC137075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137075 BINDING SITE, designated SEQ ID:37102, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64507] Another function of VGAM1928 is therefore inhibition of LOC137075 (Accession XM\_059895). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC137075. LOC143286 (Accession XM\_096412) is another VGAM1928 host target gene. LOC143286 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143286 BINDING SITE, designated SEQ ID:40354, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64508] Another function of VGAM1928 is therefore inhibition of LOC143286 (Accession XM\_096412). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143286. LOC143677 (Accession XM\_096471) is another VGAM1928 host target gene. LOC143677 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143677 BINDING SITE, designated SEQ ID:40372, to

the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64509] Another function of VGAM1928 is therefore inhibition of LOC143677 (Accession XM\_096471). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143677. LOC143916 (Accession XM\_084664) is another VGAM1928 host target gene. LOC143916 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143916 BINDING SITE, designated SEQ ID:37653, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64510] Another function of VGAM1928 is therefore inhibition of LOC143916 (Accession XM\_084664). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143916. LOC144058 (Accession XM\_084712) is another VGAM1928 host target gene. LOC144058 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC144058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144058 BINDING SITE, designated SEQ ID:37675, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64511] Another function of VGAM1928 is therefore inhibition of LOC144058 (Accession XM\_084712). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144058. LOC144308 (Accession XM\_096575) is another VGAM1928 host target gene. LOC144308 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144308 BINDING SITE, designated SEQ ID:40406, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64512] Another function of VGAM1928 is therefore inhibition of LOC144308 (Accession XM\_096575). Accordingly, utilities

of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144308. LOC144453 (Accession XM\_084869) is another VGAM1928 host target gene. LOC144453 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144453 BINDING SITE, designated SEQ ID:37747, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64513] Another function of VGAM1928 is therefore inhibition of LOC144453 (Accession XM\_084869). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144453. LOC144486 (Accession XM\_096608) is another VGAM1928 host target gene. LOC144486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC144486 BINDING SITE, designated SEQ ID:40417, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64514] Another function of VGAM1928 is therefore inhibition of LOC144486 (Accession XM\_096608). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144486. LOC144587 (Accession XM\_040195) is another VGAM1928 host target gene. LOC144587 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144587 BINDING SITE, designated SEQ ID:33269, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64515] Another function of VGAM1928 is therefore inhibition of LOC144587 (Accession XM\_040195). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144587. LOC144920 (Accession XM\_096688) is another VGAM1928 host target gene. LOC144920 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144920 BINDING SITE, designated SEQ ID:40466, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64516] Another function of VGAM1928 is therefore inhibition of LOC144920 (Accession XM\_096688). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144920. LOC145333 (Accession XM\_096766) is another VGAM1928 host target gene. LOC145333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145333 BINDING SITE, designated SEQ ID:40532, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64517] Another function of VGAM1928 is therefore inhibition of

LOC145333 (Accession XM\_096766). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145333. LOC145566 (Accession XM\_085174) is another VGAM1928 host target gene. LOC145566 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145566 BINDING SITE, designated SEQ ID:37899, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64518] Another function of VGAM1928 is therefore inhibition of LOC145566 (Accession XM\_085174). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145566. LOC145858 (Accession XM\_085258) is another VGAM1928 host target gene. LOC145858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC145858 BINDING SITE, designated SEQ ID:38003, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64519] Another function of VGAM1928 is therefore inhibition of LOC145858 (Accession XM\_085258). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145858. LOC145899 (Accession XM\_096899) is another VGAM1928 host target gene. LOC145899 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145899 BINDING SITE, designated SEQ ID:40624, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64520] Another function of VGAM1928 is therefore inhibition of LOC145899 (Accession XM\_096899). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145899. LOC145942 (Accession XM\_085281) is an-

other VGAM1928 host target gene. LOC145942 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145942 BINDING SITE, designated SEQ ID:38015, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64521] Another function of VGAM1928 is therefore inhibition of LOC145942 (Accession XM\_085281). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145942. LOC145945 (Accession XM\_096908) is another VGAM1928 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40633, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64522] Another function of VGAM1928 is therefore inhibition of LOC145945 (Accession XM\_096908). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC146224 (Accession XM\_085366) is another VGAM1928 host target gene. LOC146224 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146224 BINDING SITE, designated SEQ ID:38078, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64523] Another function of VGAM1928 is therefore inhibition of LOC146224 (Accession XM\_085366). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146224. LOC146603 (Accession XM\_085514) is another VGAM1928 host target gene. LOC146603 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146603, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146603 BINDING SITE, designated SEQ ID:38216, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64524] Another function of VGAM1928 is therefore inhibition of LOC146603 (Accession XM\_085514). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146603. LOC146669 (Accession XM\_085534) is another VGAM1928 host target gene. LOC146669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146669 BINDING SITE, designated SEQ ID:38222, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64525] Another function of VGAM1928 is therefore inhibition of LOC146669 (Accession XM\_085534). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146669. LOC147077 (Accession XM\_085699) is another VGAM1928 host target gene. LOC147077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147077 BINDING SITE, designated SEQ ID:38293, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64526] Another function of VGAM1928 is therefore inhibition of LOC147077 (Accession XM\_085699). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147077. LOC147180 (Accession XM\_097207) is another VGAM1928 host target gene. LOC147180 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147180 BINDING SITE, designated SEQ ID:40816, to the nucleotide sequence of VGAM1928 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4639.

[64527] Another function of VGAM1928 is therefore inhibition of LOC147180 (Accession XM\_097207). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147180. LOC148113 (Accession XM\_086058) is another VGAM1928 host target gene. LOC148113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148113 BINDING SITE, designated SEQ ID:38473, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64528] Another function of VGAM1928 is therefore inhibition of LOC148113 (Accession XM\_086058). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148113. LOC148936 (Accession XM\_097556) is another VGAM1928 host target gene. LOC148936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148936, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148936 BINDING SITE, designated SEQ ID:40934, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64529] Another function of VGAM1928 is therefore inhibition of LOC148936 (Accession XM\_097556). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148936. LOC148938 (Accession XM\_097555) is another VGAM1928 host target gene. LOC148938 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148938 BINDING SITE, designated SEQ ID:40927, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64530] Another function of VGAM1928 is therefore inhibition of LOC148938 (Accession XM\_097555). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC148938. LOC149692 (Accession XM\_097706) is another VGAM1928 host target gene. LOC149692 BINDING SITE1 and LOC149692 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC149692, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149692 BINDING SITE1 and LOC149692 BINDING SITE2, designated SEQ ID:41038 and SEQ ID:41039 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64531] Another function of VGAM1928 is therefore inhibition of LOC149692 (Accession XM\_097706). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149692. LOC150095 (Accession XM\_097805) is another VGAM1928 host target gene. LOC150095 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150095 BINDING SITE, designated SEQ ID:41129, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64532] Another function of VGAM1928 is therefore inhibition of LOC150095 (Accession XM\_097805). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150095. LOC150271 (Accession XM\_097859) is another VGAM1928 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41171, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64533] Another function of VGAM1928 is therefore inhibition of LOC150271 (Accession XM\_097859). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC150407 (Accession XM\_086906) is an-

other VGAM1928 host target gene. LOC150407 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150407 BINDING SITE, designated SEQ ID:38948, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64534] Another function of VGAM1928 is therefore inhibition of LOC150407 (Accession XM\_086906). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150407. LOC151176 (Accession XM\_098016) is another VGAM1928 host target gene. LOC151176 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151176 BINDING SITE, designated SEQ ID:41313, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64535] Another function of VGAM1928 is therefore inhibition of LOC151176 (Accession XM\_098016). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151176. LOC151571 (Accession XM\_098088) is another VGAM1928 host target gene. LOC151571 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151571 BINDING SITE, designated SEQ ID:41371, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64536] Another function of VGAM1928 is therefore inhibition of LOC151571 (Accession XM\_098088). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151571. LOC151959 (Accession XM\_098144) is another VGAM1928 host target gene. LOC151959 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151959, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151959 BINDING SITE, designated SEQ ID:41407, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64537] Another function of VGAM1928 is therefore inhibition of LOC151959 (Accession XM\_098144). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151959. LOC152185 (Accession NM\_144718) is another VGAM1928 host target gene. LOC152185 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152185 BINDING SITE, designated SEQ ID:29539, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64538] Another function of VGAM1928 is therefore inhibition of LOC152185 (Accession NM\_144718). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152185. LOC154282 (Accession XM\_098505) is another VGAM1928 host target gene. LOC154282 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154282 BINDING SITE, designated SEQ ID:41700, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64539] Another function of VGAM1928 is therefore inhibition of LOC154282 (Accession XM\_098505). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154282. LOC154881 (Accession XM\_088063) is another VGAM1928 host target gene. LOC154881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154881 BINDING SITE, designated SEQ ID:39501, to the nucleotide sequence of VGAM1928 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4639.

[64540] Another function of VGAM1928 is therefore inhibition of LOC154881 (Accession XM\_088063). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154881. LOC158177 (Accession XM\_088506) is another VGAM1928 host target gene. LOC158177 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158177 BINDING SITE, designated SEQ ID:39761, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64541] Another function of VGAM1928 is therefore inhibition of LOC158177 (Accession XM\_088506). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158177. LOC158969 (Accession XM\_088728) is another VGAM1928 host target gene. LOC158969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158969, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158969 BINDING SITE, designated SEQ ID:39924, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64542] Another function of VGAM1928 is therefore inhibition of LOC158969 (Accession XM\_088728). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158969. LOC163682 (Accession XM\_099402) is another VGAM1928 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42084, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64543] Another function of VGAM1928 is therefore inhibition of LOC163682 (Accession XM\_099402). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC163682. LOC197408 (Accession XM\_117031) is another VGAM1928 host target gene. LOC197408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197408 BINDING SITE, designated SEQ ID:43208, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64544] Another function of VGAM1928 is therefore inhibition of LOC197408 (Accession XM\_117031). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197408. LOC199796 (Accession XM\_058994) is another VGAM1928 host target gene. LOC199796 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199796 BINDING SITE, designated SEQ ID:36807, to

the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64545] Another function of VGAM1928 is therefore inhibition of LOC199796 (Accession XM\_058994). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199796. LOC200609 (Accession XM\_117256) is another VGAM1928 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43338, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64546] Another function of VGAM1928 is therefore inhibition of LOC200609 (Accession XM\_117256). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC201164 (Accession XM\_113904) is another VGAM1928 host target gene. LOC201164 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC201164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:42531, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64547] Another function of VGAM1928 is therefore inhibition of LOC201164 (Accession XM\_113904). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164. LOC201181 (Accession XM\_113916) is another VGAM1928 host target gene. LOC201181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201181 BINDING SITE, designated SEQ ID:42535, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64548] Another function of VGAM1928 is therefore inhibition of LOC201181 (Accession XM\_113916). Accordingly, utilities

of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201181. LOC201191 (Accession XM\_117058) is another VGAM1928 host target gene. LOC201191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201191 BINDING SITE, designated SEQ ID:43215, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64549] Another function of VGAM1928 is therefore inhibition of LOC201191 (Accession XM\_117058). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201191. LOC201799 (Accession XM\_114380) is another VGAM1928 host target gene. LOC201799 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC201799 BINDING SITE, designated SEQ ID:42913, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64550] Another function of VGAM1928 is therefore inhibition of LOC201799 (Accession XM\_114380). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201799. LOC203292 (Accession XM\_117527) is another VGAM1928 host target gene. LOC203292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203292 BINDING SITE, designated SEQ ID:43501, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64551] Another function of VGAM1928 is therefore inhibition of LOC203292 (Accession XM\_117527). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203292. LOC204970 (Accession XM\_114795) is another VGAM1928 host target gene. LOC204970 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204970 BINDING SITE, designated SEQ ID:43072, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64552] Another function of VGAM1928 is therefore inhibition of LOC204970 (Accession XM\_114795). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204970. LOC219649 (Accession XM\_167562) is another VGAM1928 host target gene. LOC219649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219649 BINDING SITE, designated SEQ ID:44668, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64553] Another function of VGAM1928 is therefore inhibition of

LOC219649 (Accession XM\_167562). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219649. LOC219654 (Accession XM\_166095) is another VGAM1928 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:43870, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64554] Another function of VGAM1928 is therefore inhibition of LOC219654 (Accession XM\_166095). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC219690 (Accession XM\_167572) is another VGAM1928 host target gene. LOC219690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC219690 BINDING SITE, designated SEQ ID:44706, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64555] Another function of VGAM1928 is therefore inhibition of LOC219690 (Accession XM\_167572). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219690. LOC219790 (Accession XM\_166124) is another VGAM1928 host target gene. LOC219790 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219790 BINDING SITE, designated SEQ ID:43906, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64556] Another function of VGAM1928 is therefore inhibition of LOC219790 (Accession XM\_166124). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219790. LOC219920 (Accession XM\_167787) is an-

other VGAM1928 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44810, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64557] Another function of VGAM1928 is therefore inhibition of LOC219920 (Accession XM\_167787). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC220038 (Accession XM\_166257) is another VGAM1928 host target gene. LOC220038 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220038 BINDING SITE, designated SEQ ID:44081, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64558] Another function of VGAM1928 is therefore inhibition of LOC220038 (Accession XM\_166257). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220038. LOC220763 (Accession XM\_055551) is another VGAM1928 host target gene. LOC220763 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220763 BINDING SITE, designated SEQ ID:36300, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64559] Another function of VGAM1928 is therefore inhibition of LOC220763 (Accession XM\_055551). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220763. LOC220766 (Accession XM\_165471) is another VGAM1928 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43649, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64560] Another function of VGAM1928 is therefore inhibition of LOC220766 (Accession XM\_165471). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC220776 (Accession XM\_043388) is another VGAM1928 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33938, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64561] Another function of VGAM1928 is therefore inhibition of LOC220776 (Accession XM\_043388). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220776. LOC221431 (Accession XM\_166380) is another VGAM1928 host target gene. LOC221431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221431 BINDING SITE, designated SEQ ID:44219, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64562] Another function of VGAM1928 is therefore inhibition of LOC221431 (Accession XM\_166380). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. LOC221810 (Accession XM\_168222) is another VGAM1928 host target gene. LOC221810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221810 BINDING SITE, designated SEQ ID:45083, to the nucleotide sequence of VGAM1928 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4639.

[64563] Another function of VGAM1928 is therefore inhibition of LOC221810 (Accession XM\_168222). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221810. LOC222183 (Accession XM\_168436) is another VGAM1928 host target gene. LOC222183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222183 BINDING SITE, designated SEQ ID:45187, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64564] Another function of VGAM1928 is therefore inhibition of LOC222183 (Accession XM\_168436). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222183. LOC222256 (Accession XM\_168571) is another VGAM1928 host target gene. LOC222256 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222256, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222256 BINDING SITE, designated SEQ ID:45248, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64565] Another function of VGAM1928 is therefore inhibition of LOC222256 (Accession XM\_168571). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222256. LOC253296 (Accession XM\_170512) is another VGAM1928 host target gene. LOC253296 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253296 BINDING SITE, designated SEQ ID:45345, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64566] Another function of VGAM1928 is therefore inhibition of LOC253296 (Accession XM\_170512). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253296. LOC253649 (Accession XM\_171211) is another VGAM1928 host target gene. LOC253649 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253649 BINDING SITE, designated SEQ ID:45999, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64567] Another function of VGAM1928 is therefore inhibition of LOC253649 (Accession XM\_171211). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253649. LOC253650 (Accession XM\_171210) is another VGAM1928 host target gene. LOC253650 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253650 BINDING SITE, designated SEQ ID:45997, to

the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64568] Another function of VGAM1928 is therefore inhibition of LOC253650 (Accession XM\_171210). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253650. LOC255042 (Accession XM\_170896) is another VGAM1928 host target gene. LOC255042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255042 BINDING SITE, designated SEQ ID:45650, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64569] Another function of VGAM1928 is therefore inhibition of LOC255042 (Accession XM\_170896). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255042. LOC256306 (Accession XM\_172976) is another VGAM1928 host target gene. LOC256306 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC256306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256306 BINDING SITE, designated SEQ ID:46237, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64570] Another function of VGAM1928 is therefore inhibition of LOC256306 (Accession XM\_172976). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256306. LOC256905 (Accession XM\_173031) is another VGAM1928 host target gene. LOC256905 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256905, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256905 BINDING SITE, designated SEQ ID:46297, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64571] Another function of VGAM1928 is therefore inhibition of LOC256905 (Accession XM\_173031). Accordingly, utilities

of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256905. LOC256925 (Accession XM\_175065) is another VGAM1928 host target gene. LOC256925 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256925 BINDING SITE, designated SEQ ID:46610, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64572] Another function of VGAM1928 is therefore inhibition of LOC256925 (Accession XM\_175065). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256925. LOC256942 (Accession XM\_170544) is another VGAM1928 host target gene. LOC256942 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256942 BINDING SITE, designated SEQ ID:45365, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64573] Another function of VGAM1928 is therefore inhibition of LOC256942 (Accession XM\_170544). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256942. LOC257408 (Accession XM\_171176) is another VGAM1928 host target gene. LOC257408 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257408 BINDING SITE, designated SEQ ID:45956, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64574] Another function of VGAM1928 is therefore inhibition of LOC257408 (Accession XM\_171176). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257408. LOC257570 (Accession XM\_175239) is another VGAM1928 host target gene. LOC257570 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257570, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257570 BINDING SITE, designated SEQ ID:46698, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64575] Another function of VGAM1928 is therefore inhibition of LOC257570 (Accession XM\_175239). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257570. LOC51157 (Accession NM\_016202) is another VGAM1928 host target gene. LOC51157 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51157 BINDING SITE, designated SEQ ID:18298, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64576] Another function of VGAM1928 is therefore inhibition of

LOC51157 (Accession NM\_016202). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51157. LOC51285 (Accession NM\_016563) is another VGAM1928 host target gene. LOC51285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51285 BINDING SITE, designated SEQ ID:18636, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64577] Another function of VGAM1928 is therefore inhibition of LOC51285 (Accession NM\_016563). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51285. LOC89890 (Accession XM\_026976) is another VGAM1928 host target gene. LOC89890 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC89890 BINDING SITE, designated SEQ ID:30381, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64578] Another function of VGAM1928 is therefore inhibition of LOC89890 (Accession XM\_026976). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89890. LOC90139 (Accession NM\_130783) is another VGAM1928 host target gene. LOC90139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90139 BINDING SITE, designated SEQ ID:28274, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64579] Another function of VGAM1928 is therefore inhibition of LOC90139 (Accession NM\_130783). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90139. LOC90499 (Accession XM\_032170) is another

VGAM1928 host target gene. LOC90499 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90499 BINDING SITE, designated SEQ ID:31582, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64580] Another function of VGAM1928 is therefore inhibition of LOC90499 (Accession XM\_032170). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90499. LOC91040 (Accession XM\_035641) is another VGAM1928 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32325, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64581] Another function of VGAM1928 is therefore inhibition of LOC91040 (Accession XM\_035641). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. LOC91291 (Accession XM\_037478) is another VGAM1928 host target gene. LOC91291 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91291, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91291 BINDING SITE, designated SEQ ID:32631, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64582] Another function of VGAM1928 is therefore inhibition of LOC91291 (Accession XM\_037478). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91291. LOC91516 (Accession XM\_038924) is another VGAM1928 host target gene. LOC91516 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91516, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91516 BINDING SITE, designated SEQ ID:32955, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64583] Another function of VGAM1928 is therefore inhibition of LOC91516 (Accession XM\_038924). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91516. LOC92078 (Accession XM\_042684) is another VGAM1928 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33742, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64584] Another function of VGAM1928 is therefore inhibition of LOC92078 (Accession XM\_042684). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92078. LOC92360 (Accession XM\_044589) is another VGAM1928 host target gene. LOC92360 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92360 BINDING SITE, designated SEQ ID:34239, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64585] Another function of VGAM1928 is therefore inhibition of LOC92360 (Accession XM\_044589). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92360. LOC93550 (Accession XM\_051999) is another VGAM1928 host target gene. LOC93550 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93550 BINDING SITE, designated SEQ ID:35933, to the nucleotide sequence of VGAM1928 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4639.

[64586] Another function of VGAM1928 is therefore inhibition of LOC93550 (Accession XM\_051999). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93550. LOC93622 (Accession NM\_138699) is another VGAM1928 host target gene. LOC93622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93622 BINDING SITE, designated SEQ ID:28950, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64587] Another function of VGAM1928 is therefore inhibition of LOC93622 (Accession NM\_138699). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93622. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1929 (VGAM1929) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[64588] VGAM1929 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1929 was detected is described hereinabove with reference to Figs. 1–8.

[64589] VGAM1929 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Simian Hemorrhagic Fever Virus. VGAM1929 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[64590] VGAM1929 gene encodes a VGAM1929 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1929 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1929 precursor RNA is designated SEQ ID:1915, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1915 is located at position 11778 relative to the genome of Simian Hemorrhagic Fever Virus.

[64591] VGAM1929 precursor RNA folds onto itself, forming

VGAM1929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[64592] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1929 folded precursor RNA into VGAM1929 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1929 RNA is designated SEQ ID:4640, and is provided hereinbelow with reference to the sequence listing part.

[64593] VGAM1929 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1929 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[64594] VGAM1929 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1929 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1929 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[64595] The complementary binding of VGAM1929 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1929 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1929 host target RNA into VGAM1929 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[64596] It is appreciated that VGAM1929 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1929 host target genes. The mRNA of each one of this plurality of VGAM1929 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1929 RNA, herein designated VGAM RNA, and which when bound by VGAM1929 RNA causes inhibition of translation of respective one or more VGAM1929 host target proteins.

[64597] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1929 gene, herein designated VGAM GENE, on one or more VGAM1929 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[64598] It is yet further appreciated that a function of VGAM1929 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of viral infection by Simian Hemorrhagic Fever Virus. Specific functions, and accordingly utilities, of VGAM1929 correlate with, and may be deduced from, the identity of the host target genes which VGAM1929 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[64599] Nucleotide sequences of the VGAM1929 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1929 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1929 are further described hereinbelow with reference to Table 1.

[64600] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1929 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1929 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[64601] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1929 gene, herein designated VGAM is inhibition of expression of VGAM1929 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1929 correlate with, and may be deduced from, the identity of the target genes which VGAM1929 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[64602] Adenylate Cyclase 7 (ADCY7, Accession NM\_001114) is a VGAM1929 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADCY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6786, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64603] A function of VGAM1929 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM\_001114), a gene which this a membrane-bound,  $Ca^{2+}$ -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM108. Adrenomedullin (ADM, Accession NM\_001124) is another VGAM1929 host target gene. ADM BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by ADM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADM BINDING SITE, designated SEQ ID:6794, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64604] Another function of VGAM1929 is therefore inhibition of Adrenomedullin (ADM, Accession NM\_001124), a gene which regulates blood pressure and heart rate. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADM. The function of ADM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM842. V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163) is another VGAM1929 host target gene. AKT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT1 BIND-

ING SITE, designated SEQ ID:11651, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64605] Another function of VGAM1929 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163), a gene which Serine-threonine protein kinase. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT1. The function of AKT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM188. Amyotrophic Lateral Sclerosis 2 (juvenile) (ALS2, Accession NM\_020919) is another VGAM1929 host target gene. ALS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2 BINDING SITE, designated SEQ ID:21929, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64606] Another function of VGAM1929 is therefore inhibition of

Amyotrophic Lateral Sclerosis 2 (juvenile) (ALS2, Accession NM\_020919). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2. Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM\_001282) is another VGAM1929 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:6957, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64607] Another function of VGAM1929 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM\_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM1126. Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 1 (X11) (APBA1, Accession XM\_046018) is another VGAM1929 host target gene. APBA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APBA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APBA1 BINDING SITE, designated SEQ ID:34646, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64608] Another function of VGAM1929 is therefore inhibition of Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 1 (X11) (APBA1, Accession XM\_046018), a gene which stabilises APP and inhibits production of proteolytic APP fragments. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APBA1. The function of APBA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Rho Guanine Nucleotide Exchange Factor (GEF) 12 (ARHGEF12,

Accession NM\_015313) is another VGAM1929 host target gene. ARHGEF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF12 BINDING SITE, designated SEQ ID:17631, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64609] Another function of VGAM1929 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 12 (ARHGEF12, Accession NM\_015313). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF12. Ataxia Telangiectasia Mutated (includes complementation groups A, C and D) (ATM, Accession NM\_138293) is another VGAM1929 host target gene. ATM BINDING SITE1 and ATM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of ATM BINDING SITE1 and ATM BINDING SITE2, designated SEQ ID:28707 and SEQ ID:28705 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64610] Another function of VGAM1929 is therefore inhibition of Ataxia Telangiectasia Mutated (includes complementation groups A, C and D) (ATM, Accession NM\_138293). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATM. ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM\_001678) is another VGAM1929 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7394, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64611] Another function of VGAM1929 is therefore inhibition of ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Beta 2 Polypeptide

(ATP1B2, Accession NM\_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na<sup>+</sup>/K<sup>+</sup> ions across the plasma membrane. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. ATPase, H<sup>+</sup> Transporting, Lysosomal 70kDa, V1 Subunit A, Isoform 1 (ATP6V1A1, Accession NM\_001690) is another VGAM1929 host target gene. ATP6V1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1A1 BINDING SITE, designated SEQ ID:7409, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64612] Another function of VGAM1929 is therefore inhibition of ATPase, H<sup>+</sup> Transporting, Lysosomal 70kDa, V1 Subunit A, Isoform 1 (ATP6V1A1, Accession NM\_001690), a gene

which is responsible for acidifying a variety of intracellular compartments in eukaryotic cells. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1A1. The function of ATP6V1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827.ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052) is another VGAM1929 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5496, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64613] Another function of VGAM1929 is therefore inhibition of ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ATP7A. UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM\_004776) is another VGAM1929 host target gene. B4GALT5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B4GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:11169, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64614] Another function of VGAM1929 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM\_004776). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5. BCRP2 (Accession XM\_031102) is another VGAM1929 host target gene. BCRP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCRP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of BCRP2 BINDING SITE, designated SEQ ID:31277, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64615] Another function of VGAM1929 is therefore inhibition of BCRP2 (Accession XM\_031102). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCRP2. 2,3-bisphosphoglycerate Mutase (BPGM, Accession NM\_001724) is another VGAM1929 host target gene. BPGM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BPGM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPGM BINDING SITE, designated SEQ ID:7456, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64616] Another function of VGAM1929 is therefore inhibition of 2,3-bisphosphoglycerate Mutase (BPGM, Accession NM\_001724), a gene which plays a role in regulating hemoglobin oxygen affinity. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with BPGM. The function of BPGM has been established by previous studies. Chen et al. (1971) described a genetically determined electrophoretic variant of 2,3-diphosphoglycerate mutase in a Canadian Eskimo family. The findings in heterozygotes were consistent with the view that the protein is a dimer of 2 identical subunits. Scott and Wright (1982) found DPGM to be polymorphic in 4 Alaskan ethnic groups. Hemoglobin and hematocrit were elevated in all deficient persons. Thus, both hemolytic anemia and polycythemia have been observed with deficiency of DPGM. Rosa et al. (1973, 1978) showed that the DPGM and 2,3-bisphosphoglycerate phosphatase activities of red cells are due to a single enzyme, bisphosphoglycerate mutase (EC 5.4.2.4). Joulin et al. (1986) cloned and sequenced cDNA for human red cell 2,3-bisphosphoglycerate mutase (EC 2.7.5.4). They presented a revised amino acid sequence of human BPGM based on the nucleotide sequence data. BPGM shows some phosphoglycerate mutase activity (Sasaki et al., 1975); nevertheless, the major portion of PGAM activity in the red cells is expressed by PGAMA (OMIM Ref. No. 172250), a protein genetically distinct from BPGM but

structurally related to it. The PGAMA locus is situated on chromosome 10. Using a cDNA clone for human BPGM in in situ hybridization experiments, Joulin et al. (1987) and Barichard et al. (1987) mapped the BPGM gene to 7q22–q34. Joulin et al. (1988) isolated the 2,3–bisphosphoglycerate mutase gene from genomic libraries. By Southern blots and DNA sequencing, they determined that it extends over 22 kb and is composed of 2 introns and 3 exons. The second exon correlates with a functional subdomain of the protein. No GC–rich sequence or GC box was found in the 5–prime flanking region of the gene. Both amino acid and cDNA sequence studies show that DPGAM is homologous to PGAM (172250, 261670) (Joulin et al., 1986; Yanagawa et al., 1986).

[64617] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64618] Rosa, R.; Prehu, M.–O.; Beuzard, Y.; Rosa, J. : The first case of a complete deficiency of diphosphoglycerate mutase in human erythrocytes. J. Clin. Invest. 62: 907–915, 1978. ; and

[64619] Joulin, V.; Peduzzi, J.; Romeo, P.–H.; Rosa, R.; Valentin, C.;

Dubart, A.; Lapeyre, B.; Blouquit, Y.; Garel, M.-C.;  
Goossens, M.; Rosa, J.; Cohen-Solal, M. : Molecular  
cloning and sequen.

[64620] Further studies establishing the function and utilities of  
BPGM are found in John Hopkins OMIM database record ID  
222800, and in cited publications numbered 9987-9989,  
1841, 9990-9995, 92, 9996-9998, 378 and 9999-10002  
listed in the bibliography section hereinbelow, which are  
also hereby incorporated by reference. BTG Family, Mem-  
ber 2 (BTG2, Accession NM\_006763) is another  
VGAM1929 host target gene. BTG2 BINDING SITE is HOST  
TARGET binding site found in the 3' untranslated region  
of mRNA encoded by BTG2, corresponding to a HOST  
TARGET binding site such as BINDING SITE I, BINDING SITE  
II or BINDING SITE III. Table 2 illustrates the complemen-  
tarity of the nucleotide sequences of BTG2 BINDING SITE,  
designated SEQ ID:13627, to the nucleotide sequence of  
VGAM1929 RNA, herein designated VGAM RNA, also des-  
ignated SEQ ID:4640.

[64621] Another function of VGAM1929 is therefore inhibition of  
BTG Family, Member 2 (BTG2, Accession NM\_006763). Ac-  
cordingly, utilities of VGAM1929 include diagnosis, pre-  
vention and treatment of diseases and clinical conditions

associated with BTG2. Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM\_052116) is another VGAM1929 host target gene. CAPZA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPZA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPZA1 BINDING SITE, designated SEQ ID:35949, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64622] Another function of VGAM1929 is therefore inhibition of Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM\_052116), a gene which is alpha 1 subunit of actin filament capping protein; binds actin, has roles in cell motility and actin assembly. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPZA1. The function of CAPZA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM547. CD83 Antigen (activated B lymphocytes, immunoglobulin superfamily) (CD83, Acces-

sion NM\_004233) is another VGAM1929 host target gene. CD83 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD83, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD83 BINDING SITE, designated SEQ ID:10427, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64623] Another function of VGAM1929 is therefore inhibition of CD83 Antigen (activated B lymphocytes, immunoglobulin superfamily) (CD83, Accession NM\_004233), a gene which may play a significant role in antigen presentation or the cellular interactions that follow lymphocyte activation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD83. The function of CD83 has been established by previous studies. Many cell surface molecules that regulate immune responses contain conserved structural features similar to those found in immunoglobulins. These molecules are presumed to have evolved from a common precursor and are members of a large superfamily. Many of them are involved in cell-cell adhesion and

signal transduction Using flow cytometric analysis, Scholler et al. (2001) showed that CD83 binds to monocytes but not lymphocytes and that the binding is enhanced by stress. Immunoprecipitation and immunoblot analysis indicated that CD83 binds to a 72-kD ligand containing sialic acid. Scholler et al. (2001) concluded that CD83 is an adhesion receptor belonging to the SIGLEC family (see OMIM Ref. No. 600751). Animal model experiments lend further support to the function of CD83. Fujimoto et al. (2002) found that CD4 (OMIM Ref. No. 186940)-positive T-cell generation requires engagement of CD83. Cd83  $-/-$  mice had a specific block in Cd4 single-positive thymocyte development without increased Cd4/Cd8 (see OMIM Ref. No. 186910) double-positive or Cd8 single-positive thymocytes. This resulted in a selective 75 to 90% reduction in peripheral Cd4-positive T cells, predominantly within the naive subset. Wildtype thymocytes and bone marrow stem cells failed to differentiate into mature Cd4-positive T cells when transferred into Cd83  $-/-$  mice, while Cd83  $-/-$  thymocytes and stem cells developed normally in wildtype mice. The authors concluded that CD83 expression represents an additional regulatory component for CD4-positive T-cell develop-

ment in the thymus

- [64624] It is appreciated that the abovementioned animal model for CD83 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.
- [64625] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [64626] Scholler, N.; Hayden-Ledbetter, M.; Hellstrom, K.-E.; Hellstrom, I.; Ledbetter, J. A. : CD83 is a sialic acid-binding Ig-like lectin (Siglec) adhesion receptor that binds monocytes and a subset of activated CD8(+) T cells. J. Immun. 166: 3865-3872, 2001. ; and
- [64627] Fujimoto, Y.; Tu, L.; Miller, A. S.; Bock, C.; Fujimoto, M.; Doyle, C.; Steeber, D. A.; Tedder, T. F. : CD83 expression influences CD4+ T cell development in the thymus. Cell 108: 755-76.
- [64628] Further studies establishing the function and utilities of CD83 are found in John Hopkins OMIM database record ID 604534, and in cited publications numbered 7090-7094, 742 and 7460-7461 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1,

Accession NM\_004360) is another VGAM1929 host target gene. CDH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:10564, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64629] Another function of VGAM1929 is therefore inhibition of Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM\_004360). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1. Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932) is another VGAM1929 host target gene. CDH6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH6 BINDING SITE, designated SEQ ID:11379, to the nucleotide sequence of VGAM1929 RNA, herein

designated VGAM RNA, also designated SEQ ID:4640.

[64630] Another function of VGAM1929 is therefore inhibition of Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH6. The function of CDH6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.CERD4 (Accession NM\_012074) is another VGAM1929 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14346, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64631] Another function of VGAM1929 is therefore inhibition of CERD4 (Accession NM\_012074). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CERD4. Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM\_001271) is another VGAM1929 host target gene. CHD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHD2 BINDING SITE, designated SEQ ID:6935, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64632] Another function of VGAM1929 is therefore inhibition of Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM\_001271). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHD2. CIS4 (Accession NM\_004232) is another VGAM1929 host target gene. CIS4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CIS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIS4 BINDING SITE, designated SEQ

ID:10424, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64633] Another function of VGAM1929 is therefore inhibition of CIS4 (Accession NM\_004232). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIS4. Chloride Channel 4 (CLCN4, Accession NM\_001830) is another VGAM1929 host target gene. CLCN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN4 BINDING SITE, designated SEQ ID:7575, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64634] Another function of VGAM1929 is therefore inhibition of Chloride Channel 4 (CLCN4, Accession NM\_001830), a gene which is regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with CLCN4. The function of CLCN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM558. Chloride Channel 6 (CLCN6, Accession NM\_001286) is another VGAM1929 host target gene. CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CLCN6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3, designated SEQ ID:6961, SEQ ID:22338 and SEQ ID:22343 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64635] Another function of VGAM1929 is therefore inhibition of Chloride Channel 6 (CLCN6, Accession NM\_001286), a gene which is a voltage-gated chloride channel. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6. The function of CLCN6 and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM599. Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493) is another VGAM1929 host target gene. CLN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN5 BINDING SITE, designated SEQ ID:13227, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64636] Another function of VGAM1929 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN5. Clock Homolog (mouse) (CLOCK, Accession NM\_004898) is another VGAM1929 host target gene. CLOCK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLOCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CLOCK BINDING SITE, designated SEQ ID:11332, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64637] Another function of VGAM1929 is therefore inhibition of Clock Homolog (mouse) (CLOCK, Accession NM\_004898). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLOCK. Calponin 2 (CNN2, Accession NM\_004368) is another VGAM1929 host target gene. CNN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNN2 BINDING SITE, designated SEQ ID:10585, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64638] Another function of VGAM1929 is therefore inhibition of Calponin 2 (CNN2, Accession NM\_004368), a gene which may be involved in the structural organization and/or anchorage of actin filaments. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CNN2. The function of CNN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1498. COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM\_078470) is another VGAM1929 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:27795, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64639] Another function of VGAM1929 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM\_078470). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Cytochrome B-561 (CYB561, Accession NM\_001915) is another VGAM1929 host target gene. CYB561 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by CYB561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYB561 BINDING SITE, designated SEQ ID:7631, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64640] Another function of VGAM1929 is therefore inhibition of Cytochrome B-561 (CYB561, Accession NM\_001915), a gene which is a secretory vesicle-specific electron transport protein. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYB561. The function of CYB561 has been established by previous studies. Cytochrome b561 is a major transmembrane protein that is specific to catecholamine and neuropeptide secretory vesicles of the adrenal medulla, pituitary gland, and other neuroendocrine tissues. This 30-kD cytochrome is present in both the small synaptic vesicles and the large dense core vesicles (chromaffin granules) of the tissues. Its role is to supply reducing equivalents to 2 monooxygenases, dopamine beta-hydroxylase (OMIM Ref. No.

223360) in chromaffin granules and peptidylglycine alpha-amidating monooxygenase (OMIM Ref. No. 170270) in neurosecretory vesicles. The cytochrome fulfills this role by catalyzing the transfer of electrons from a cytoplasmic donor, ascorbate, across a phospholipid bilayer to the luminal acceptor, semidehydroascorbate, in the interior of the vesicles. The continuously regenerated ascorbate within these vesicles is the immediate donor for the monooxygenases within the neuroendocrine secretory vesicles. Thus, cytochrome b561 is a transmembrane electron channel. Srivastava (1995) showed that the human CYB561 gene contains 5 exons spanning approximately 11 kb. Northern blots showed highest expression in colon cancer lines, T-cell lymphomas and K-562 cells.

[64641] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64642] McBride, O. W.; Yi, H. F.; Srivastava, M. : The human cytochrome b561 gene (CYB561) is located at 17q11-qter. Genomics 21: 662-663, 1994. ; and

[64643] Srivastava, M. : Genomic structure and expression of the human gene encoding cytochrome b(561), an integral protein of the chromaffin granule membrane. J. Biol. Chem.

270: 22714–22720, 1.

[64644] Further studies establishing the function and utilities of CYB561 are found in John Hopkins OMIM database record ID 600019, and in cited publications numbered 8789–8790 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytochrome P450, Subfamily IVA, Polypeptide 11 (CYP4A11, Accession NM\_000778) is another VGAM1929 host target gene. CYP4A11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP4A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP4A11 BINDING SITE, designated SEQ ID:6419, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64645] Another function of VGAM1929 is therefore inhibition of Cytochrome P450, Subfamily IVA, Polypeptide 11 (CYP4A11, Accession NM\_000778), a gene which catalyzes the omega- and (omega-1)-hydroxylation of various fatty acids. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with CYP4A11. The function of CYP4A11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM798. Cytochrome P450, Subfamily VIII B (sterol 12- $\alpha$ -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM\_004391) is another VGAM1929 host target gene. CYP8B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP8B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:10626, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64646] Another function of VGAM1929 is therefore inhibition of Cytochrome P450, Subfamily VIII B (sterol 12- $\alpha$ -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM\_004391), a gene which functions in bile acid biosynthesis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1. The function of

CYP8B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923.Dachshund Homolog (Drosophila) (DACH, Accession NM\_080759) is another VGAM1929 host target gene. DACH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:28036, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64647] Another function of VGAM1929 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM\_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260.DEAD/H

(Asp–Glu–Ala–Asp/His) Box Polypeptide 20, 103kDa (DDX20, Accession NM\_007204) is another VGAM1929 host target gene. DDX20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX20 BINDING SITE, designated SEQ ID:14068, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64648] Another function of VGAM1929 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 20, 103kDa (DDX20, Accession NM\_007204), a gene which interacts with SMN and is required for pre-mRNA splicing in the nucleus. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX20. The function of DDX20 has been established by previous studies. Using coimmunoprecipitation, gel filtration experiments, and in vitro protein–binding assays, Charroux et al. (1999) showed that DDX20 is in a complex with SMN, Gemin2 (SIP1; 602595), and several spliceosomal Sm proteins of

snRNPs. Using deletion mutants, they determined that the C-terminal domain of DDX20 mediates the interaction with SMN. They concluded that DDX20 may play an important role in spliceosomal snRNP biogenesis. Klappacher et al. (2002) described a mechanism in which induction of the ETS repressor METS (ETV3; 164873) links terminal differentiation to cell cycle arrest. Using macrophages as a model, they provided evidence that METS blocks RAS (OMIM Ref. No. 190020)-dependent proliferation without inhibiting RAS-dependent expression of cell type-specific genes by selectively replacing ETS activators on the promoters of cell cycle control genes. The antiproliferative effects of METS required its interaction with DP103. Functional interactions between the METS/DP103 complex and E2F (see OMIM Ref. No. 189971)/RB (see OMIM Ref. No. 180200) family proteins were also necessary for inhibition of cellular proliferation, suggesting a combinatorial code that directs permanent cell cycle exit during terminal differentiation.

[64649] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64650] Charroux, B.; Pellizzoni, L.; Perkinson, R. A.; Shevchenko,

A.; Mann, M.; Dreyfuss, G. : Gemin3: a novel DEAD box protein that interacts with SMN, the spinal muscular atrophy gene product, and is a component of gems. J. Cell Biol. 147: 1181–1193, 1999. ; and

[64651] Klappacher, G. W.; Lunyak, V. V.; Sykes, D. B.; Sawka-Verhelle, D.; Sage, J.; Brard, G.; Ngo, S. D.; Gangadharan, D.; Jacks, T.; Kamps, M. P.; Rose, D. W.; Rosenfeld, M. G. : An induced.

[64652] Further studies establishing the function and utilities of DDX20 are found in John Hopkins OMIM database record ID 606168, and in cited publications numbered 4108–410 and 3141 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM\_004397) is another VGAM1929 host target gene. DDX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX6 BINDING SITE, designated SEQ ID:10649, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also des–

ignated SEQ ID:4640.

[64653] Another function of VGAM1929 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM\_004397), a gene which is putative RNA helicases. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX6. The function of DDX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Distal-less Homeobox 4 (DLX4, Accession NM\_138281) is another VGAM1929 host target gene. DLX4 BINDING SITE1 and DLX4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLX4 BINDING SITE1 and DLX4 BINDING SITE2, designated SEQ ID:28695 and SEQ ID:7647 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64654] Another function of VGAM1929 is therefore inhibition of

Distal-less Homeobox 4 (DLX4, Accession NM\_138281), a gene which may regulate gene expression, morphogenesis, and differentiation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLX4. The function of DLX4 has been established by previous studies. Using degenerate PCR, Nakamura et al. (1996) cloned a gene, which they referred to as DLX7, from human and mouse that may represent the mammalian ortholog of the newt gene NuHBox-5. They isolated a human cDNA predicting a 167-amino acid protein. The homeodomains of these genes are highly similar to those of all other vertebrate DLX genes, but there is divergence upstream of the homeodomain between the human and mouse DLX7 genes and between DLX7 and other DLX genes. They presented evidence that the mouse Dlx7 gene is alternatively spliced. By Northern blot analysis, Nakamura et al. (1996) found that DLX7 is expressed as a 2.3-kb transcript in several human cell lines. By fluorescence in situ hybridization (FISH), Nakamura et al. (1996) mapped DLX7 to 17q21.3-q22. They stated that the human DLX7 and DLX3 (OMIM Ref. No. 600525) genes are 10 kb apart and are arranged in a tail-to-tail tandem ori-

entation, similarly to that found in mouse. Using dual-color FISH, Nakamura et al. (1996) determined that human DLX7 and HOX9B (OMIM Ref. No. 142964) lie within 2 Mb of one another. Quinn et al. (1997) undertook a DNA binding site screen of a 32-week human placental cDNA library using a consensus homeodomain binding site as a probe. They claimed that this study represented the first library screen carried out to isolate homeo box genes from the human placenta. They found that 3 homeo box genes known to be expressed in embryo, HB24 (OMIM Ref. No. 142995), GAX (OMIM Ref. No. 600535), and MSX2 (OMIM Ref. No. 123101), are also expressed in the placenta. They also identified a novel homeo box gene, designated DLX4 by them, that showed 85% sequence identity with the homeodomain encoded by the *Drosophila* 'distal-less' gene. Using FISH, they assigned DLX4 to 17q21-q22. This placed DLX4 in the same region of chromosome 17 as a member of the distal-less family gene DLX3 (OMIM Ref. No. 600525) and the HOXB homeo box gene cluster (see OMIM Ref. No. HOXB1; 142968). DLX1 (OMIM Ref. No. 600029) and DLX2 (OMIM Ref. No. 126255) are closely linked on chromosome 2; DLX5 (OMIM Ref. No. 600028) and DLX6 (OMIM Ref. No. 600030) are closely linked on

chromosome 7. Thus, Quinn et al. (1997) predicted that DLX3 and DLX4 are closely linked and that they arose through gene duplication and divergence from a common ancestral precursor.

[64655] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64656] Morasso, M. I.; Yonescu, R.; Griffin, C. A.; Sargent, T. D. : Localization of human DLX8 to chromosome 17q21.3–q22 by fluorescence in situ hybridization. *Mammalian Genome* 8: 302–303, 1997. ; and

[64657] Nakamura, S.; Stock, D. W.; Wydner, K. L.; Bollekens, J. A.; Takeshita, K.; Nagai, B. M.; Chiba, S.; Kitamura, T.; Freeland, T. M.; Zhao, Z.; Minowada, J.; Lawrence, J. B.; Weiss, K. M.

[64658] Further studies establishing the function and utilities of DLX4 are found in John Hopkins OMIM database record ID 601911, and in cited publications numbered 913 and 9133 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Deoxyribonuclease I (DNASE1, Accession NM\_005223) is another VGAM1929 host target gene. DNASE1 BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by DNASE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNASE1 BINDING SITE, designated SEQ ID:11717, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64659] Another function of VGAM1929 is therefore inhibition of Deoxyribonuclease I (DNASE1, Accession NM\_005223), a gene which seems to be involved in cell death. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1. The function of DNASE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM492. Desmoplakin (DPI, DPII) (DSP, Accession NM\_004415) is another VGAM1929 host target gene. DSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DSP BINDING SITE, designated SEQ ID:10677, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64660] Another function of VGAM1929 is therefore inhibition of Desmoplakin (DPI, DPII) (DSP, Accession NM\_004415). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSP. Dual Specificity Phosphatase 6 (DUSP6, Accession XM\_038308) is another VGAM1929 host target gene. DUSP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP6 BINDING SITE, designated SEQ ID:32811, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64661] Another function of VGAM1929 is therefore inhibition of Dual Specificity Phosphatase 6 (DUSP6, Accession XM\_038308), a gene which inactivates map kinases. Accordingly, utilities of VGAM1929 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with DUSP6. The function of DUSP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1763. Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM\_004423) is another VGAM1929 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10695, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64662] Another function of VGAM1929 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM\_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM57. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM\_003583) is another VGAM1929 host target gene. DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2, designated SEQ ID:9632 and SEQ ID:13208 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64663] Another function of VGAM1929 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM\_003583). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK2. Ephrin-B1 (EFNB1, Accession NM\_004429) is another VGAM1929 host target gene. EFNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNB1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB1 BINDING SITE, designated SEQ ID:10713, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64664] Another function of VGAM1929 is therefore inhibition of Ephrin-B1 (EFNB1, Accession NM\_004429), a gene which is a transmembrane ligand of Eph-related receptor tyrosine kinases, has a role in cell adhesion. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB1. The function of EFNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390.EH-domain Containing 3 (EHD3, Accession NM\_014600) is another VGAM1929 host target gene. EHD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EHD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD3 BINDING SITE, designated SEQ ID:15958,

to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64665] Another function of VGAM1929 is therefore inhibition of EH-domain Containing 3 (EHD3, Accession NM\_014600). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD3. EH-domain Containing 4 (EHD4, Accession NM\_139265) is another VGAM1929 host target gene. EHD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EHD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD4 BINDING SITE, designated SEQ ID:29257, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64666] Another function of VGAM1929 is therefore inhibition of EH-domain Containing 4 (EHD4, Accession NM\_139265). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD4. Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM\_012199) is an-

other VGAM1929 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14505, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64667] Another function of VGAM1929 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM\_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118. Eukaryotic Translation Initiation Factor 2, Subunit 3 Gamma, 52kDa (EIF2S3, Accession NM\_001415) is another VGAM1929 host target gene. EIF2S3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

EIF2S3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2S3 BINDING SITE, designated SEQ ID:7112, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64668] Another function of VGAM1929 is therefore inhibition of Eukaryotic Translation Initiation Factor 2, Subunit 3 Gamma, 52kDa (EIF2S3, Accession NM\_001415), a gene which functions in the early steps of protein synthesis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2S3. The function of EIF2S3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1254. Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM\_001418) is another VGAM1929 host target gene. EIF4G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF4G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4G2 BINDING SITE, designated SEQ ID:7118, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64669] Another function of VGAM1929 is therefore inhibition of Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM\_001418), a gene which is a repressor of translation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4G2. The function of EIF4G2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1065. Eukaryotic Translation Initiation Factor 5A2 (EIF5A2, Accession NM\_020390) is another VGAM1929 host target gene. EIF5A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5A2 BINDING SITE, designated SEQ ID:21662, to the nucleotide sequence of

VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64670] Another function of VGAM1929 is therefore inhibition of Eukaryotic Translation Initiation Factor 5A2 (EIF5A2, Accession NM\_020390). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5A2. Engulfment and Cell Motility 1 (ced-12 homolog, *C. elegans*) (ELMO1, Accession NM\_130442) is another VGAM1929 host target gene. ELMO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELMO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELMO1 BINDING SITE, designated SEQ ID:28202, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64671] Another function of VGAM1929 is therefore inhibition of Engulfment and Cell Motility 1 (ced-12 homolog, *C. elegans*) (ELMO1, Accession NM\_130442). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ELMO1. Enamelin (ENAM, Accession NM\_031889) is another VGAM1929 host target gene. ENAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAM BINDING SITE, designated SEQ ID:25635, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64672] Another function of VGAM1929 is therefore inhibition of Enamelin (ENAM, Accession NM\_031889). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAM. EphA3 (EPHA3, Accession NM\_005233) is another VGAM1929 host target gene. EPHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA3 BINDING SITE, designated SEQ ID:11742, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA,

also designated SEQ ID:4640.

[64673] Another function of VGAM1929 is therefore inhibition of EphA3 (EPHA3, Accession NM\_005233), a gene which binds to ephrin-a2, -a3, -a4 and -a5. could play a role in lymphoid function. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA3. The function of EPHA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM164.ErbB2 Interacting Protein (ERBB2IP, Accession NM\_018695) is another VGAM1929 host target gene. ERBB2IP BINDING SITE1 and ERBB2IP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ERBB2IP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB2IP BINDING SITE1 and ERBB2IP BINDING SITE2, designated SEQ ID:20770 and SEQ ID:20773 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64674] Another function of VGAM1929 is therefore inhibition of

ErbB2 Interacting Protein (ERBB2IP, Accession NM\_018695), a gene which ERBB2 interacting protein; acts as an adaptor for the receptor ERBB2/HER2. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB2IP. The function of ERBB2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1019. Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM\_004458) is another VGAM1929 host target gene. FACL4 BINDING SITE1 and FACL4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FACL4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE1 and FACL4 BINDING SITE2, designated SEQ ID:10763 and SEQ ID:23253 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64675] Another function of VGAM1929 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Ac-

cession NM\_004458). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4. Flap Structure-specific Endonuclease 1 (FEN1, Accession NM\_004111) is another VGAM1929 host target gene. FEN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEN1 BINDING SITE, designated SEQ ID:10322, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64676] Another function of VGAM1929 is therefore inhibition of Flap Structure-specific Endonuclease 1 (FEN1, Accession NM\_004111), a gene which Flap endonuclease; double-stranded DNA 5'-3' exonuclease. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEN1. The function of FEN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1217. Fibronectin Leucine Rich Transmembrane

Protein 2 (FLRT2, Accession NM\_013231) is another VGAM1929 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14889, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64677] Another function of VGAM1929 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Forkhead Box F1 (FOXF1, Accession NM\_001451) is another VGAM1929 host target gene. FOXF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FOXF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXF1 BINDING SITE, designated SEQ ID:7184, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64678] Another function of VGAM1929 is therefore inhibition of Forkhead Box F1 (FOXF1, Accession NM\_001451), a gene which is a probable transcription activator for a number of lung-specific genes. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXF1. The function of FOXF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM292.FREB (Accession NM\_032738) is another VGAM1929 host target gene. FREB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FREB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREB BINDING SITE, design-

nated SEQ ID:26468, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64679] Another function of VGAM1929 is therefore inhibition of FREB (Accession NM\_032738). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREB. FXYP Domain Containing Ion Transport Regulator 6 (FXYP6, Accession NM\_022003) is another VGAM1929 host target gene. FXYP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FXYP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYP6 BINDING SITE, designated SEQ ID:22549, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64680] Another function of VGAM1929 is therefore inhibition of FXYP Domain Containing Ion Transport Regulator 6 (FXYP6, Accession NM\_022003). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYP6.

GTP Cyclohydrolase 1 (dopa-responsive dystonia) (GCH1, Accession NM\_000161) is another VGAM1929 host target gene. GCH1 BINDING SITE1 and GCH1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GCH1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCH1 BINDING SITE1 and GCH1 BINDING SITE2, designated SEQ ID:5666 and SEQ ID:5667 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64681] Another function of VGAM1929 is therefore inhibition of GTP Cyclohydrolase 1 (dopa-responsive dystonia) (GCH1, Accession NM\_000161). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCH1. Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM\_000838) is another VGAM1929 host target gene. GRM1 BINDING SITE1 and GRM1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GRM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM1 BINDING SITE1 and GRM1 BINDING SITE2, designated SEQ ID:6500 and SEQ ID:6501 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64682] Another function of VGAM1929 is therefore inhibition of Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM\_000838), a gene which promotes phosphoinositide hydrolysis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM1. The function of GRM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786. Histone Deacetylase 4 (HDAC4, Accession NM\_006037) is another VGAM1929 host target gene. HDAC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC4 BINDING SITE, designated SEQ ID:12662, to the nucleotide se-

quence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64683] Another function of VGAM1929 is therefore inhibition of Histone Deacetylase 4 (HDAC4, Accession NM\_006037), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and may mediate transcriptional regulation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC4. The function of HDAC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Hepatoma-derived Growth Factor (high-mobility group protein 1-like) (HDGF, Accession NM\_004494) is another VGAM1929 host target gene. HDGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDGF BINDING SITE, designated SEQ ID:10833, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64684] Another function of VGAM1929 is therefore inhibition of Hepatoma-derived Growth Factor (high-mobility group protein 1-like) (HDGF, Accession NM\_004494), a gene which is a heparin-binding protein, with mitogenic activity for fibroblasts. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDGF. The function of HDGF has been established by previous studies. Nakamura et al. (1994) purified a novel hepatoma-derived growth factor from the conditioned medium of human hepatoma-derived cell line HuH-7. Molecular cloning of a cDNA from the cDNA library of the same cell line was done on the basis of the N-terminal amino acid sequence. The cDNA was 2.4 kb long and the deduced amino acid sequence contained 240 amino acids without a signal peptide-like N-terminal hydrophobic sequence. The primary sequence shared homology with the high mobility group-1 protein (OMIM Ref. No. 163905); they showed 23.4% amino acid identity and 35.6% amino acid similarity. Immunofluorescence study showed that HDGF is localized in the cytoplasm of hepatoma cells and northern blots showed that it is expressed ubiquitously in normal tissues and tumor cell lines. Nakamura et al. (1994) suggested

that it is a novel heparin-binding protein with mitogenic activity for fibroblasts. HDGF is ubiquitously expressed in normal tissues and tumor cell lines. By PCR screening of a commercial monochromosomal hybrid panel, Wanschura et al. (1996) mapped HDGF to the X chromosome. By fluorescence in situ hybridization, they determined the sub-chromosomal localization to be Xq25. Whereas a major group of the HMG protein family has been mapped to chromosomal segments frequently involved in the tumorigenesis of benign solid tumors, no tumor association for the Xq25 region was known.

[64685] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64686] Nakamura, H.; Izumoto, Y.; Kambe, H.; Kuroda, T.; Mori, T.; Kawamura, K.; Yamamoto, H.; Kishimoto, T. : Molecular cloning of complementary DNA for a novel human hepatoma-derived growth factor: its homology with high mobility group-1 protein. J. Biol. Chem. 269: 25143-25149, 1994. ; and

[64687] Wanschura, S.; Schoenmakers, E. F. P. M.; Huysmans, C.; Bartnitzke, S.; Van de Ven, W. J. M.; Bullerdiek, J. : Mapping of the gene encoding the human hepatoma-derived

growth factor (HDG.

[64688] Further studies establishing the function and utilities of HDGF are found in John Hopkins OMIM database record ID 300043, and in cited publications numbered 8839–8840 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is another VGAM1929 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45222, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64689] Another function of VGAM1929 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Hypermethylated In Cancer 1 (HIC1, Accession XM\_113307) is another VGAM1929 host target gene. HIC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HIC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC1 BINDING SITE, designated SEQ ID:42210, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64690] Another function of VGAM1929 is therefore inhibition of Hypermethylated In Cancer 1 (HIC1, Accession XM\_113307), a gene which is a transcriptional repressor and may act as a tumor suppressor. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC1. The function of HIC1 has been established by previous studies. The human HIC1 (hypermethylated in cancer) gene maps to 17p13.3 and is deleted in the contiguous

gene disorder Miller–Dieker syndrome (MDS; 247200) (Makos Wales et al., 1995; Chong et al., 1996). Grimm et al. (1999) isolated the murine Hic1 gene, which encodes a zinc finger protein with a poxvirus and zinc finger (POZ) domain. Comparison of genomic and cDNA sequences predicted 2 exons for the murine Hic1 gene. The second exon exhibits 88% identity at the DNA level to the corresponding region of the human HIC1 gene. During embryonic development, Hic1 is expressed in mesenchymes of the sclerotomes, lateral body wall, limb, and craniofacial regions embedding the outgrowing peripheral nerves during their differentiation. During fetal development, Hic1 is also expressed in mesenchymes apposed to the precartilaginous condensations, at many interfaces to budding epithelia of inner organs, and weakly in muscles. Grimm et al. (1999) observed activation of Hic1 expression in the embryonic anlagen of many tissues displaying anomalies in MDS patients. Besides lissencephaly, MDS patients exhibit facial dysmorphism and frequently additional birth defects, e.g., anomalies of the heart, kidney, gastrointestinal tract, and the limbs. Thus, HIC1 activity may correlate with the defective development of the nose, jaws, extremities, gastrointestinal tract, and kidney in MDS pa-

tients. Animal model experiments lend further support to the function of HIC1. The location of HIC1 in the Miller–Dieker syndrome critical deletion region on 17p13.3 makes it a candidate gene for involvement in the MDS gene deletion syndrome. To study the function of murine Hic1 in development, Carter et al. (2000) created Hic1–deficient mice. They found that these animals died perinatally and exhibited varying combinations of gross developmental defects throughout the second half of development, including acrania, exencephaly, cleft palate, limb anomalies, and omphalocele. These abnormalities demonstrated a role for Hic1 in the development of structures affected in the Miller–Dieker syndrome, and provided functional evidence to strengthen its candidacy as a gene involved in that disorder.

[64691] It is appreciated that the abovementioned animal model for HIC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[64692] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64693] Carter, M. G.; Johns, M. A.; Zeng, X.; Zhou, L.; Zink, M. C.;

Mankowski, J. L.; Donovan, D. M.; Baylin, S. B. : Mice deficient in the candidate tumor suppressor gene Hic1 exhibit developmental defects of structures affected in the Miller-Dieker syndrome. Hum. Molec. Genet. 9: 413-419, 2000. ; and

[64694] Grimm, C.; Sporle, R.; Schmid, T. E.; Adler, I.-D.; Adamski, J.; Schughart, K.; Graw, J. : Isolation and embryonic expression of the novel mouse gene Hic1, the homologue of HIC1, a cand.

[64695] Further studies establishing the function and utilities of HIC1 are found in John Hopkins OMIM database record ID 603825, and in cited publications numbered 5183-5186 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box B5 (HOXB5, Accession NM\_002147) is another VGAM1929 host target gene. HOXB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB5 BINDING SITE, designated SEQ ID:7925, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4640.

[64696] Another function of VGAM1929 is therefore inhibition of Homeo Box B5 (HOXB5, Accession NM\_002147), a gene which may regulate gene expression, morphogenesis and differentiation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB5. The function of HOXB5 has been established by previous studies. As reviewed by Acampora et al. (1989), the homeo box region 2 contains 9 homeo box genes in 180 kb of DNA on chromosome 17. The order, from 5-prime to 3-prime, is HOXB9 (HOX2E), HOXB8 (HOX2D), HOXB7 (HOX2C), HOXB6 (HOX2B), HOXB5 (HOX2A), HOXB4 (HOX2F), HOXB3 (HOX2G), HOXB2 (HOX2H), HOXB1 (HOX2I). Classical models of craniofacial development argue that the neural crest is prepatterned or preprogrammed to make specific head structures before its migration from the neural tube. In contrast, recent studies in several vertebrates, including mouse, chick, and zebrafish, have provided evidence for plasticity in patterning neural crest populations. Using tissue transposition and molecular analyses in avian embryos, Trainor et al. (2002) reconciled these findings by demonstrating that classical manipulation experiments,

which form the basis of the pre patterning model, involved transplantation of a local signaling center, the isthmic organizer. FGF8 (OMIM Ref. No. 600483) signaling from the isthmus alters HOXA2 expression and consequently branchial arch patterning, demonstrating that neural crest cells are patterned by environmental signals.

[64697] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64698] Acampora, D.; D'Esposito, M.; Faiella, A.; Pannese, M.; Migliaccio, E.; Morelli, F.; Stornaiuolo, A.; Nigro, V.; Simone, A.; Boncinelli, E. : The human HOX gene family. Nucleic Acids Res. 17: 10385–10402, 1989. ; and

[64699] Trainor, P. A.; Ariza-McNaughton, L.; Krumlauf, R. : Role of the isthmus and FGFs in resolving the paradox of neural crest plasticity and pre patterning. Science 295: 1288–1291, 2002.

[64700] Further studies establishing the function and utilities of HOXB5 are found in John Hopkins OMIM database record ID 142960, and in cited publications numbered 5207–2646, 5213–2651, 5217–5218, 2652–265 and 11977 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo

Box C4 (HOXC4, Accession NM\_014620) is another VGAM1929 host target gene. HOXC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HOXC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC4 BINDING SITE, designated SEQ ID:15974, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64701] Another function of VGAM1929 is therefore inhibition of Homeo Box C4 (HOXC4, Accession NM\_014620), a gene which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC4. The function of HOXC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Heat Shock 70kDa Protein 4 (HSPA4, Accession XM\_114482) is another VGAM1929 host target gene. HSPA4 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by HSPA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA4 BINDING SITE, designated SEQ ID:42976, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64702] Another function of VGAM1929 is therefore inhibition of Heat Shock 70kDa Protein 4 (HSPA4, Accession XM\_114482). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA4. Isoprenylcysteine Carboxyl Methyltransferase (ICMT, Accession NM\_012405) is another VGAM1929 host target gene. ICMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICMT BINDING SITE, designated SEQ ID:14782, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64703] Another function of VGAM1929 is therefore inhibition of Isoprenylcysteine Carboxyl Methyltransferase (ICMT, Accession NM\_012405). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICMT. Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878) is another VGAM1929 host target gene. IL2RB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL2RB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RB BINDING SITE, designated SEQ ID:6576, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64704] Another function of VGAM1929 is therefore inhibition of Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RB. The function of IL2RB and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM450. Integrin, Alpha 6 (ITGA6, Accession NM\_000210) is another VGAM1929 host target gene. ITGA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA6 BINDING SITE, designated SEQ ID:5706, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64705] Another function of VGAM1929 is therefore inhibition of Integrin, Alpha 6 (ITGA6, Accession NM\_000210). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA6. Jagged 2 (JAG2, Accession NM\_002226) is another VGAM1929 host target gene. JAG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAG2

BINDING SITE, designated SEQ ID:8007, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64706] Another function of VGAM1929 is therefore inhibition of Jagged 2 (JAG2, Accession NM\_002226), a gene which is a putative notch ligand involved in the mediation of notch signaling. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAG2. The function of JAG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM136. Kinesin Family Member 1B (KIF1B, Accession NM\_015074) is another VGAM1929 host target gene. KIF1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF1B BINDING SITE, designated SEQ ID:17448, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64707] Another function of VGAM1929 is therefore inhibition of

Kinesin Family Member 1B (KIF1B, Accession NM\_015074), a gene which motor for anterograde transport of mitochondria. has a microtubule plus end-directed motility. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF1B. The function of KIF1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1026. Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM\_002293) is another VGAM1929 host target gene. LAMC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:8075, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64708] Another function of VGAM1929 is therefore inhibition of Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM\_002293), a gene which may mediate the attachment,

migration, and organization of cells into tissues. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC1. The function of LAMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM812. LIM Domain Binding 3 (LDB3, Accession XM\_084376) is another VGAM1929 host target gene. LDB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LDB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDB3 BINDING SITE, designated SEQ ID:37562, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64709] Another function of VGAM1929 is therefore inhibition of LIM Domain Binding 3 (LDB3, Accession XM\_084376), a gene which could play a role during mating. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDB3. The function of LDB3 has been established by

previous studies. PDZ domain-containing proteins interact with each other in cytoskeletal assembly or with other proteins involved in targeting and clustering of membrane proteins. By screening a muscle cDNA library using a muscle EST sequence as the probe, Faulkner et al. (1999) obtained cDNAs encoding mouse and human ZASP. The deduced 283-amino acid human ZASP protein has an 85-residue N-terminal PDZ domain and shares significant similarity with the 734-amino acid protein encoded by the KIAA0613 cDNA isolated by Ishikawa et al. (1998).

Database, PCR, and genomic DNA analyses indicated the presence of alternatively spliced isoforms of ZASP that encode proteins of 470, 617, and 727 (KIAA0613) amino acids. Northern blot analysis detected a major 1.9-kb ZASP transcript that was most abundant in skeletal muscle and heart but absent in other tissues tested. Additional transcripts of 4.0 and 5.4 kb were detected when using a 5-prime rather than a 3-prime probe. RT-PCR analysis detected wide expression of KIAA0613, with weak or undetectable expression in liver, pancreas, and spleen (Ishikawa et al., 1998). Western blot analysis showed expression of 32- and 78-kD proteins in heart and muscle. Immunofluorescence microscopy demonstrated that ZASP

is expressed in pseudopodia and in the cytoplasm around the nucleus, and that it colocalizes with actin in the I-band. Immunoelectron microscopy localized ZASP within the Z-band. Yeast 2-hybrid analysis determined that the PDZ domain of ZASP interacts with the C terminus of alpha-actinin-2 (ACTN2; 102573

[64710] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64711] Faulkner, G.; Pallavicini, A.; Formentin, E.; Comelli, A.; Ievolella, C.; Trevisan, S.; Bortoletto, G.; Scannapieco, P.; Salamon, M.; Mouly, V.; Valle, G.; Lanfranchi, G. : ZASP: a new Z-band alternatively spliced PDZ-motif protein. J. Cell Biol. 146: 465-475, 1999. ; and

[64712] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete sequence.

[64713] Further studies establishing the function and utilities of LDB3 are found in John Hopkins OMIM database record ID 605906, and in cited publications numbered 74 and 9440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LENG4 (Accession

NM\_024298) is another VGAM1929 host target gene.

LENG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23587, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64714] Another function of VGAM1929 is therefore inhibition of LENG4 (Accession NM\_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259. Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310) is another VGAM1929 host target gene. LIFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIFR, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIFR BINDING SITE, designated SEQ ID:8101, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64715] Another function of VGAM1929 is therefore inhibition of Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIFR. Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM\_033300) is another VGAM1929 host target gene. LRP8 BINDING SITE1 and LRP8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LRP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP8 BINDING SITE1 and LRP8 BINDING SITE2, designated SEQ ID:27129 and SEQ ID:11005 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64716] Another function of VGAM1929 is therefore inhibition of

Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM\_033300), a gene which binds vldl and transports it into cells by endocytosis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP8. The function of LRP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM\_021020) is another VGAM1929 host target gene. LZTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTS1 BINDING SITE, designated SEQ ID:22010, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64717] Another function of VGAM1929 is therefore inhibition of Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM\_021020), a gene which Zygin 1; may have a

role in axonal outgrowth; has similarity to *C. elegans* UNC-76. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTS1. The function of LZTS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM890.

MAP-kinase Activating Death Domain (MADD, Accession NM\_130470) is another VGAM1929 host target gene. MADD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MADD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADD BINDING SITE, designated SEQ ID:28238, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64718] Another function of VGAM1929 is therefore inhibition of MAP-kinase Activating Death Domain (MADD, Accession NM\_130470), a gene which may regulate two different pathways for neural activities. interacts with the type-1 tumor necrosis factor receptor (TNFR1); death domain-

containing protein. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADD. The function of MADD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM\_005359) is another VGAM1929 host target gene. MADH4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MADH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH4 BINDING SITE, designated SEQ ID:11833, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64719] Another function of VGAM1929 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM\_005359), a gene which common mediator of signal transduction by  $\text{tgf-}\beta$  (transforming growth factor) superfamily; *smad4* is the common *smad* (co-*smad*). promotes binding of the

smad2/sm44/fast-1 complex to dna and provides an activation function required for smad1 or smad2 to stimulate transcription. may act as a tumor suppressor. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH4. The function of MADH4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Monoamine Oxidase B (MAOB, Accession XM\_010261) is another VGAM1929 host target gene. MAOB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAOB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAOB BINDING SITE, designated SEQ ID:30149, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64720] Another function of VGAM1929 is therefore inhibition of Monoamine Oxidase B (MAOB, Accession XM\_010261). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with MAOB. Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM\_000242) is another VGAM1929 host target gene. MBL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBL2 BINDING SITE, designated SEQ ID:5762, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64721] Another function of VGAM1929 is therefore inhibition of Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM\_000242). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBL2. Muscleblind-like (Drosophila) (MBNL, Accession NM\_021038) is another VGAM1929 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of MBNL BINDING SITE, designated SEQ ID:22027, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64722] Another function of VGAM1929 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM\_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397) is another VGAM1929 host target gene. MEF2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2C BINDING SITE, designated SEQ ID:8213, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ

ID:4640.

[64723] Another function of VGAM1929 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2C. The function of MEF2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM386.Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog (mouse) (MEIS1, Accession NM\_002398) is another VGAM1929 host target gene. MEIS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEIS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEIS1 BINDING SITE, designated SEQ ID:8220, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64724] Another function of VGAM1929 is therefore inhibition of

Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog (mouse) (MEIS1, Accession NM\_002398), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS1. The function of MEIS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

#### VGAM894.Meningioma Expressed Antigen 5

(hyaluronidase) (MGEA5, Accession NM\_012215) is another VGAM1929 host target gene. MGEA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGEA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA5 BINDING SITE, designated SEQ ID:14521, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64725] Another function of VGAM1929 is therefore inhibition of Meningioma Expressed Antigen 5 (hyaluronidase) (MGEA5, Accession NM\_012215), a gene which has a hyaluronidase

activity. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGEA5. The function of MGEA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM801. Midline 1 (Opitz/BBB syndrome) (MID1, Accession NM\_000381) is another VGAM1929 host target gene. MID1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MID1 BINDING SITE, designated SEQ ID:5957, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64726] Another function of VGAM1929 is therefore inhibition of Midline 1 (Opitz/BBB syndrome) (MID1, Accession NM\_000381). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MID1. Myeloid Leukemia Factor 2 (MLF2, Accession NM\_005439) is another VGAM1929 host target gene. MLF2 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by MLF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLF2 BINDING SITE, designated SEQ ID:11925, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64727] Another function of VGAM1929 is therefore inhibition of Myeloid Leukemia Factor 2 (MLF2, Accession NM\_005439). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLF2. Matrix Metalloproteinase 19 (MMP19, Accession NM\_022790) is another VGAM1929 host target gene. MMP19 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE, designated SEQ ID:23075, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64728] Another function of VGAM1929 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM\_022790). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP19. MAX Binding Protein (MNT, Accession NM\_020310) is another VGAM1929 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21562, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64729] Another function of VGAM1929 is therefore inhibition of MAX Binding Protein (MNT, Accession NM\_020310). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Antigen Identified By Monoclonal Antibody MRC OX-2 (MOX2, Accession XM\_039962) is another VGAM1929 host target gene. MOX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MOX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOX2 BINDING SITE, designated SEQ ID:33237, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64730] Another function of VGAM1929 is therefore inhibition of Antigen Identified By Monoclonal Antibody MRC OX-2 (MOX2, Accession XM\_039962). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOX2. Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM\_000139) is another VGAM1929 host target gene. MS4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A1 BINDING SITE, designated SEQ ID:5632, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64731] Another function of VGAM1929 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM\_000139), a gene which may be involved in the regulation of b-cell activation and proliferation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A1. The function of MS4A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM362. Myotubularin Related Protein 3 (MTMR3, Accession NM\_021090) is another VGAM1929 host target gene. MTMR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR3 BINDING SITE, designated SEQ ID:22071, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64732] Another function of VGAM1929 is therefore inhibition of Myotubularin Related Protein 3 (MTMR3, Accession

NM\_021090), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR3. The function of MTMR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1718.

MAX Interacting Protein 1 (MXI1, Accession NM\_130439) is another VGAM1929 host target gene. MXI1 BINDING SITE1 and MXI1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MXI1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MXI1 BINDING SITE1 and MXI1 BINDING SITE2, designated SEQ ID:28194 and SEQ ID:12584 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64733] Another function of VGAM1929 is therefore inhibition of MAX Interacting Protein 1 (MXI1, Accession NM\_130439), a gene which acts as a tumor suppressor in vivo, engages the MYC network in a functionally relevant manner. Ac-

cordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MXI1. The function of MXI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM128. NCK-associated Protein 1 (NCKAP1, Accession NM\_013436) is another VGAM1929 host target gene. NCKAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCKAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCKAP1 BINDING SITE, designated SEQ ID:15096, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64734] Another function of VGAM1929 is therefore inhibition of NCK-associated Protein 1 (NCKAP1, Accession NM\_013436). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCKAP1. Nuclear Receptor Coactivator 3 (NCOA3, Accession NM\_006534) is another VGAM1929 host target gene. NCOA3 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA3 BINDING SITE, designated SEQ ID:13288, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64735] Another function of VGAM1929 is therefore inhibition of Nuclear Receptor Coactivator 3 (NCOA3, Accession NM\_006534), a gene which directly binds nuclear receptors and stimulates the transcriptional activities in hormone-dependent fashion. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA3. The function of NCOA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215. Nebulin (NEB, Accession NM\_004543) is another VGAM1929 host target gene. NEB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NEB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEB BINDING SITE, designated SEQ ID:10892, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64736] Another function of VGAM1929 is therefore inhibition of Nebulin (NEB, Accession NM\_004543). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEB. NIMA (never in mitosis gene a)-related Kinase 4 (NEK4, Accession NM\_003157) is another VGAM1929 host target gene. NEK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEK4 BINDING SITE, designated SEQ ID:9138, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64737] Another function of VGAM1929 is therefore inhibition of NIMA (never in mitosis gene a)-related Kinase 4 (NEK4, Accession NM\_003157). Accordingly, utilities of

VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK4. Nuclear Factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM\_003204) is another VGAM1929 host target gene. NFE2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFE2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFE2L1 BINDING SITE, designated SEQ ID:9199, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64738] Another function of VGAM1929 is therefore inhibition of Nuclear Factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM\_003204), a gene which may regulate expression of ferritin genes. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2L1. The function of NFE2L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM369.Nerve Growth Factor Receptor (TNFRSF16) As-

sociated Protein 1 (NGFRAP1, Accession NM\_014380) is another VGAM1929 host target gene. NGFRAP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NGFRAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFRAP1 BINDING SITE, designated SEQ ID:15715, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64739] Another function of VGAM1929 is therefore inhibition of Nerve Growth Factor Receptor (TNFRSF16) Associated Protein 1 (NGFRAP1, Accession NM\_014380), a gene which may play an important role in the pathogenesis of neuro-genetic diseases. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFRAP1. The function of NGFRAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260.Nipsnap Homolog 1 (C. elegans) (NIPSNAP1, Accession NM\_003634) is another VGAM1929 host target gene. NIPSNAP1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by NIPSNAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIPSNAP1 BINDING SITE, designated SEQ ID:9701, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64740] Another function of VGAM1929 is therefore inhibition of Nipsnap Homolog 1 (*C. elegans*) (NIPSNAP1, Accession NM\_003634). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIPSNAP1. Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010) is another VGAM1929 host target gene. NRCAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NRCAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:11450, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64741] Another function of VGAM1929 is therefore inhibition of Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM. The function of NRCAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM268.2'-5'-oligoadenylate Synthetase 2, 69/71kDa (OAS2, Accession NM\_016817) is another VGAM1929 host target gene. OAS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS2 BINDING SITE, designated SEQ ID:18806, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64742] Another function of VGAM1929 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 2, 69/71kDa (OAS2, Ac-

cession NM\_016817), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS2. The function of OAS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1498. Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM\_130833) is another VGAM1929 host target gene. OPA1 BINDING SITE1 through OPA1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OPA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA1 BINDING SITE1 through OPA1 BINDING SITE5, designated SEQ ID:28322, SEQ ID:28330, SEQ ID:28338, SEQ ID:28346 and SEQ ID:28354 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64743] Another function of VGAM1929 is therefore inhibition of Optic Atrophy 1 (autosomal dominant) (OPA1, Accession

NM\_130833). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA1. Purinergic Receptor P2Y, G-protein Coupled, 1 (P2RY1, Accession NM\_002563) is another VGAM1929 host target gene. P2RY1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY1 BINDING SITE, designated SEQ ID:8411, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64744] Another function of VGAM1929 is therefore inhibition of Purinergic Receptor P2Y, G-protein Coupled, 1 (P2RY1, Accession NM\_002563), a gene which plays an essential role in thrombotic states. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY1. The function of P2RY1 has been established by previous studies. P2 purinoceptors have been broadly classified as P2X receptors (e.g., 600843), which are ATP-gated channels; P2Z receptors, which mediate nonselective pores in

mast cells; and P2Y receptors, a family of G protein-coupled receptors. Based on the recommendation for nomenclature of P2 purinoceptors, the P2Y purinoceptors were numbered in the order of cloning. Ayyanathan et al. (1996) noted that P2Y1, P2Y2 (PR2Y2; 600041), and P2Y3 have been cloned from a variety of species. P2Y1 responds to both ADP and ATP. The P2Y2 receptor cDNA was cloned in the human and this receptor was known as P2U under previous nomenclature. Ayyanathan et al. (1996) cloned the human P2Y1 receptor (P2RY1) and its 2 alternately polyadenylated forms of mRNA. The P2Y1 purinoceptor was also cloned from a human placenta cDNA library by Leon et al. (1996). They found that the gene encodes a 372-amino acid polypeptide. Northern blot analysis revealed 2 transcripts of 4.6 and 7.5 kb which were expressed in many tissues. Using oligonucleotide primers specific for the human P2Y1 purinergic receptor, Ayyanathan et al. (1996) amplified a region from genomic DNA from a panel of mouse/human somatic cell hybrid cell lines and localized the P2Y1 gene to human chromosome 3. By sequence tagged site (STS) mapping utilizing the National Center for Biotechnology Information (NCBI) database, Somers et al. (1997) mapped the

P2RY1 gene between flanking markers D3S1279 and D3S1280 at a position 173 to 174 cM from the most telomeric markers on the short arm of chromosome 3. Animal model experiments lend further support to the function of P2RY1. Leon et al. (1999) generated P2Y1-null mice to define the physiologic role of the P2Y1 receptor. These mice were viable with no apparent abnormalities affecting their development, survival, reproduction, or morphology of platelets, and the platelet count in these animals was identical to that of wildtype mice. However, platelets from P2Y1-deficient mice were unable to aggregate in response to usual concentrations of ADP and displayed impaired aggregation to other agonists, while high concentrations of ADP induced platelet aggregation without shape change. In addition, ADP-induced inhibition of adenylyl cyclase still occurred, demonstrating the existence of an ADP receptor distinct from P2Y1. P2Y1-null mice had no spontaneous bleeding tendency but were resistant to thromboembolism induced by intravenous injection of ADP or collagen and adrenaline. Hence, the P2Y1 receptor plays an essential role in thrombotic states and represents a potential target for antithrombotic drugs.

[64745] It is appreciated that the abovementioned animal model for P2RY1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[64746] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64747] Ayyanathan, K.; Webbs, T. E.; Sandhu, A. K.; Athwal, R. S.; Barnard, E. A.; Kunapuli, S. P. : Cloning and chromosomal localization of the human P2Y1 purinoceptor. Biochem. Biophys. Res. Commun. 218: 783–788, 1996. ; and

[64748] Leon, C.; Hechler, B.; Freund, M.; Eckly, A.; Vial, C.; Ohlmann, P.; Dierich, A.; LeMeur, M.; Cazenave, J.-P.; Gachet, C. : Defective platelet aggregation and increased resistance to thr.

[64749] Further studies establishing the function and utilities of P2RY1 are found in John Hopkins OMIM database record ID 601167, and in cited publications numbered 9467–947 and 7718 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM\_006452) is another

VGAM1929 host target gene. PAICS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAICS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAICS BINDING SITE, designated SEQ ID:13165, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64750] Another function of VGAM1929 is therefore inhibition of Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM\_006452), a gene which is required for purine biosynthesis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAICS. The function of PAICS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894. Phosphodiesterase 7A (PDE7A, Accession XM\_037534) is another VGAM1929 host target gene. PDE7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE7A,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE7A BINDING SITE, designated SEQ ID:32642, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64751] Another function of VGAM1929 is therefore inhibition of Phosphodiesterase 7A (PDE7A, Accession XM\_037534), a gene which is a CAMP-specific phosphodiesterase 7A and plays a role in signal transduction. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE7A. The function of PDE7A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1662. Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM\_003768) is another VGAM1929 host target gene. PEA15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PEA15 BINDING SITE, designated SEQ ID:9849, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64752] Another function of VGAM1929 is therefore inhibition of Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM\_003768), a gene which is a phosphoprotein and involved in glucose uptake. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEA15. The function of PEA15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949. Period Homolog 2 (Drosophila) (PER2, Accession NM\_022817) is another VGAM1929 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:23094, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64753] Another function of VGAM1929 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM\_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM\_138694) is another VGAM1929 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28939, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64754] Another function of VGAM1929 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive)

sive) (PKHD1, Accession NM\_138694). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655) is another VGAM1929 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8519, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64755] Another function of VGAM1929 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29. Pleckstrin

(PLEK, Accession NM\_002664) is another VGAM1929 host target gene. PLEK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLEK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLEK BINDING SITE, designated SEQ ID:8532, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64756] Another function of VGAM1929 is therefore inhibition of Pleckstrin (PLEK, Accession NM\_002664), a gene which is the major protein kinase c substrate of platelets. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLEK. The function of PLEK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.POU Domain, Class 3, Transcription Factor 1 (POU3F1, Accession XM\_001334) is another VGAM1929 host target gene. POU3F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU3F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU3F1 BINDING SITE, designated SEQ ID:29833, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64757] Another function of VGAM1929 is therefore inhibition of POU Domain, Class 3, Transcription Factor 1 (POU3F1, Accession XM\_001334), a gene which involves in early embryogenesis and neurogenesis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU3F1. The function of POU3F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM85. Peroxisome Proliferative Activated Receptor, Gamma, Coactivator 1 (PPARGC1, Accession NM\_013261) is another VGAM1929 host target gene. PPARGC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPARGC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPARGC1 BINDING SITE, designated SEQ

ID:14933, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64758] Another function of VGAM1929 is therefore inhibition of Peroxisome Proliferative Activated Receptor, Gamma, Coactivator 1 (PPARGC1, Accession NM\_013261), a gene which may play a role in insulin sensitivity and thermogenesis. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPARGC1. The function of PPARGC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM952.PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_012231) is another VGAM1929 host target gene. PRDM2 BINDING SITE1 and PRDM2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRDM2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE1 and PRDM2 BINDING SITE2, designated SEQ ID:14535 and SEQ ID:18003 respectively, to the

nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64759] Another function of VGAM1929 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_012231), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Protein Kinase, CAMP-dependent, Regulatory, Type I, Alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NM\_002734) is another VGAM1929 host target gene. PRKAR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKAR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR1A BINDING SITE, designated SEQ ID:8608, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4640.

[64760] Another function of VGAM1929 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type I, Alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NM\_002734). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR1A. Proteasome (prosome, macropain) Subunit, Beta Type, 9 (large multifunctional protease 2) (PSMB9, Accession NM\_002800) is another VGAM1929 host target gene. PSMB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMB9 BINDING SITE, designated SEQ ID:8676, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64761] Another function of VGAM1929 is therefore inhibition of Proteasome (prosome, macropain) Subunit, Beta Type, 9 (large multifunctional protease 2) (PSMB9, Accession NM\_002800), a gene which is one component of a multicatalytic proteinase complex. Accordingly, utilities of

VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMB9. The function of PSMB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1915. Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM\_004339) is another VGAM1929 host target gene. PTTG1IP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTTG1IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTTG1IP BINDING SITE, designated SEQ ID:10534, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64762] Another function of VGAM1929 is therefore inhibition of Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM\_004339), a gene which facilitates the translocation of PTTG to the nucleus. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTTG1IP. The function of PTTG1IP and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. RAD51-like 1 (*S. cerevisiae*) (RAD51L1, Accession NM\_002877) is another VGAM1929 host target gene. RAD51L1 BINDING SITE1 and RAD51L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD51L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD51L1 BINDING SITE1 and RAD51L1 BINDING SITE2, designated SEQ ID:8788 and SEQ ID:28577 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64763] Another function of VGAM1929 is therefore inhibition of RAD51-like 1 (*S. cerevisiae*) (RAD51L1, Accession NM\_002877), a gene which is a member of the RAD51 family of strand-transfer proteins. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD51L1. The function of RAD51L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM1020.RAD51-like 3 (*S. cerevisiae*) (RAD51L3, Accession NM\_133630) is another VGAM1929 host target gene. RAD51L3 BINDING SITE1 through RAD51L3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD51L3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD51L3 BINDING SITE1 through RAD51L3 BINDING SITE3, designated SEQ ID:28580, SEQ ID:8789 and SEQ ID:8809 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64764] Another function of VGAM1929 is therefore inhibition of RAD51-like 3 (*S. cerevisiae*) (RAD51L3, Accession NM\_133630), a gene which may have a role in dna repair and recombination. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD51L3. The function of RAD51L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1310.Regulatory Factor X, 5 (influences HLA class

II expression) (RFX5, Accession NM\_000449) is another VGAM1929 host target gene. RFX5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX5 BINDING SITE, designated SEQ ID:6047, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64765] Another function of VGAM1929 is therefore inhibition of Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM\_000449), a gene which activates transcription from class ii mhc promoters. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX5. The function of RFX5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Retinal G Protein Coupled Receptor (RGR, Accession NM\_002921) is another VGAM1929 host target gene. RGR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by RGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGR BINDING SITE, designated SEQ ID:8825, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64766] Another function of VGAM1929 is therefore inhibition of Retinal G Protein Coupled Receptor (RGR, Accession NM\_002921), a gene which catalyse the isomerization of the chromophore by a retinochrome-like mechanism and act as a receptor for all-trans-and 11-cis-retinal. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGR. The function of RGR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1283. Ribonuclease, RNase A Family, K6 (RNASE6, Accession NM\_005615) is another VGAM1929 host target gene. RNASE6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RNASE6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of RNASE6 BINDING SITE, designated SEQ ID:12133, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64767] Another function of VGAM1929 is therefore inhibition of Ribonuclease, RNase A Family, K6 (RNASE6, Accession NM\_005615). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNASE6. Ring Finger Protein 4 (RNF4, Accession NM\_002938) is another VGAM1929 host target gene. RNF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF4 BINDING SITE, designated SEQ ID:8842, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64768] Another function of VGAM1929 is therefore inhibition of Ring Finger Protein 4 (RNF4, Accession NM\_002938). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with RNF4. Ribosomal Protein L15 (RPL15, Accession NM\_002948) is another VGAM1929 host target gene. RPL15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPL15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL15 BINDING SITE, designated SEQ ID:8861, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64769] Another function of VGAM1929 is therefore inhibition of Ribosomal Protein L15 (RPL15, Accession NM\_002948). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL15. Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM\_042096) is another VGAM1929 host target gene. RRM2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRM2B BIND-

ING SITE, designated SEQ ID:33691, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64770] Another function of VGAM1929 is therefore inhibition of Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM\_042096). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRM2B. Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754) is another VGAM1929 host target gene. RUNX1 BINDING SITE1 and RUNX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RUNX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE1 and RUNX1 BINDING SITE2, designated SEQ ID:7499 and SEQ ID:7504 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64771] Another function of VGAM1929 is therefore inhibition of Runt-related Transcription Factor 1 (acute myeloid

leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM\_006922) is another VGAM1929 host target gene. SCN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN3A BINDING SITE, designated SEQ ID:13799, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64772] Another function of VGAM1929 is therefore inhibition of Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM\_006922), a gene which may be important for maintaining neural membrane excitability. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN3A. The function of SCN3A and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM124. Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (*S. cerevisiae*) (SIRT1, Accession NM\_012238) is another VGAM1929 host target gene. SIRT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRT1 BINDING SITE, designated SEQ ID:14544, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64773] Another function of VGAM1929 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (*S. cerevisiae*) (SIRT1, Accession NM\_012238), a gene which may function as intracellular regulatory protein with mono-ADP-ribosyltransferase activity. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT1. The function of SIRT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM244.Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM\_006749) is another VGAM1929 host target gene. SLC20A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC20A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC20A2 BINDING SITE, designated SEQ ID:13601, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64774] Another function of VGAM1929 is therefore inhibition of Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM\_006749), a gene which is a sodium–phosphate symporter. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC20A2. The function of SLC20A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.Solute Carrier Family 21 (organic anion transporter), Member 9 (SLC21A9, Acces–

sion NM\_007256) is another VGAM1929 host target gene. SLC21A9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A9 BINDING SITE, designated SEQ ID:14128, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64775] Another function of VGAM1929 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 9 (SLC21A9, Accession NM\_007256), a gene which is Moderately similar to SLC21A2 prostaglandin transporter. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A9. The function of SLC21A9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894. Solute Carrier Family 2 (facilitated glucose transporter), Member 2 (SLC2A2, Accession NM\_000340) is another VGAM1929 host target gene. SLC2A2 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A2 BINDING SITE, designated SEQ ID:5892, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64776] Another function of VGAM1929 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 2 (SLC2A2, Accession NM\_000340). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A2. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM\_003615) is another VGAM1929 host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:9676, to the nucleotide sequence of VGAM1929 RNA,

herein designated VGAM RNA, also designated SEQ ID:4640.

[64777] Another function of VGAM1929 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM\_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM66. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 8 (SLC4A8, Accession NM\_004858) is another VGAM1929 host target gene. SLC4A8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A8 BINDING SITE, designated SEQ ID:11267, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4640.

[64778] Another function of VGAM1929 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 8 (SLC4A8, Accession NM\_004858), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A8. The function of SLC4A8 has been established by previous studies. Sodium bicarbonate cotransporters (NBCs) mediate the coupled movement of sodium and bicarbonate ions across the plasma membrane. Soleimani and Burnham (2000) reviewed NBCs and their regulation in physiologic and pathophysiologic states. By screening human brain cDNAs for the potential to encode proteins that are at least 50 kD, Nagase et al. (1998) isolated a partial SLC4A8 cDNA, which they called KIAA0739, that lacks 5-prime coding sequence. The deduced 1,130-amino acid partial SLC4A8 protein shares 56.5% amino acid sequence identity with the human NBC1 (SLC4A4; 603345) variant kNBC across 953 residues. Analysis of SLC4A8 expression in 10 human tissues by RT-PCR followed by ELISA detected highest SLC4A8 expression in brain and testis, lower expression in pancreas,

kidney, lung, and ovary, and no expression in heart, liver, spleen, or skeletal muscle

[64779] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64780] Soleimani, M.; Burnham, C. E. : Physiologic and molecular aspects of the Na(+):HCO(3-) cotransporter in health and disease processes. *Kidney Int.* 57: 371–384, 2000. ; and

[64781] Amlal, H.; Burnham, C. E.; Soleimani, M. : Characterization of Na(+)/HCO(3-) cotransporter isoform NBC-3. *Am. J. Physiol.* 276: F903–F913, 1999.

[64782] Further studies establishing the function and utilities of SLC4A8 are found in John Hopkins OMIM database record ID 605024, and in cited publications numbered 1083, 704 and 7959 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_139071) is another VGAM1929 host target gene. SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2, designated SEQ ID:29143 and SEQ ID:9045 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64783] Another function of VGAM1929 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_139071), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1. The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.SNL (Accession NM\_003088) is another VGAM1929 host target gene. SNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SNL BINDING SITE, designated SEQ ID:9067, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64784] Another function of VGAM1929 is therefore inhibition of SNL (Accession NM\_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675. Sorting Nexin 9 (SNX9, Accession NM\_016224) is another VGAM1929 host target gene. SNX9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX9 BINDING SITE, designated SEQ ID:18330, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64785] Another function of VGAM1929 is therefore inhibition of

Sorting Nexin 9 (SNX9, Accession NM\_016224). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX9. Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385) is another VGAM1929 host target gene. SORBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORBS1 BINDING SITE, designated SEQ ID:17689, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64786] Another function of VGAM1929 is therefore inhibition of Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385), a gene which necessary for cell polarization during vegetative growth. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORBS1. The function of SORBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM475.Spectrin, Beta, Non-erythrocytic 4 (SPTBN4, Accession NM\_025213) is another VGAM1929 host target gene. SPTBN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTBN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTBN4 BINDING SITE, designated SEQ ID:24884, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64787] Another function of VGAM1929 is therefore inhibition of Spectrin, Beta, Non-erythrocytic 4 (SPTBN4, Accession NM\_025213), a gene which is critical for the maintenance of plasma membrane shape and lipid asymmetry. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTBN4. The function of SPTBN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM958.Sarcospan (Kras oncogene-associated gene) (SSPN, Accession NM\_005086) is another VGAM1929 host target gene. SSPN BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSPN BINDING SITE, designated SEQ ID:11537, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64788] Another function of VGAM1929 is therefore inhibition of Sarcospan (Kras oncogene-associated gene) (SSPN, Accession NM\_005086), a gene which spans the muscle plasma membrane and forms a link between the f-actin cytoskeleton and the extracellular matrix. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSPN. The function of SSPN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM996. Staufen, RNA Binding Protein, Homolog 2 (Drosophila) (STAU2, Accession NM\_014393) is another VGAM1929 host target gene. STAU2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAU2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAU2 BINDING SITE, designated SEQ ID:15724, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64789] Another function of VGAM1929 is therefore inhibition of Staufen, RNA Binding Protein, Homolog 2 (Drosophila) (STAU2, Accession NM\_014393). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAU2. Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM\_006283) is another VGAM1929 host target gene. TACC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TACC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:12969, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64790] Another function of VGAM1929 is therefore inhibition of

Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM\_006283). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1. T-box, Brain, 1 (TBR1, Accession NM\_006593) is another VGAM1929 host target gene. TBR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBR1 BINDING SITE, designated SEQ ID:13358, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64791] Another function of VGAM1929 is therefore inhibition of T-box, Brain, 1 (TBR1, Accession NM\_006593), a gene which is of unknown function. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBR1. The function of TBR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM719. Transforming Growth Factor, Beta Receptor II

(70/80kDa) (TGFB2, Accession NM\_003242) is another VGAM1929 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB2 BINDING SITE, designated SEQ ID:9242, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64792] Another function of VGAM1929 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM\_003242). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB2. Thrombomodulin (THBD, Accession NM\_000361) is another VGAM1929 host target gene. THBD BINDING SITE1 and THBD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by THBD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBD BINDING SITE1 and THBD BINDING SITE2,

designated SEQ ID:5923 and SEQ ID:5924 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64793] Another function of VGAM1929 is therefore inhibition of Thrombomodulin (THBD, Accession NM\_000361). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBD. TIA1 Cytotoxic Granule-associated RNA Binding Protein (TIA1, Accession NM\_022173) is another VGAM1929 host target gene. TIA1 BINDING SITE1 and TIA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TIA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIA1 BINDING SITE1 and TIA1 BINDING SITE2, designated SEQ ID:22735 and SEQ ID:14838 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64794] Another function of VGAM1929 is therefore inhibition of TIA1 Cytotoxic Granule-associated RNA Binding Protein (TIA1, Accession NM\_022173), a gene which possesses nucleolytic activity against cytotoxic lymphocyte target

cells. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIA1. The function of TIA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Tumor Necrosis Factor, Alpha-induced Protein 1 (endothelial) (TNFAIP1, Accession NM\_021137) is another VGAM1929 host target gene. TNFAIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP1 BINDING SITE, designated SEQ ID:22112, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64795] Another function of VGAM1929 is therefore inhibition of Tumor Necrosis Factor, Alpha-induced Protein 1 (endothelial) (TNFAIP1, Accession NM\_021137). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP1. TOX (Accession NM\_014729) is an-

other VGAM1929 host target gene. TOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOX BINDING SITE, designated SEQ ID:16330, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64796] Another function of VGAM1929 is therefore inhibition of TOX (Accession NM\_014729). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOX. Tripartite Motif-containing 14 (TRIM14, Accession NM\_014788) is another VGAM1929 host target gene. TRIM14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM14 BINDING SITE, designated SEQ ID:16670, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ

ID:4640.

[64797] Another function of VGAM1929 is therefore inhibition of Tripartite Motif-containing 14 (TRIM14, Accession NM\_014788), a gene which is composed of 3 zinc-binding domains and is involved in development and cell growth. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14. The function of TRIM14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM\_003304) is another VGAM1929 host target gene. TRPC1 BINDING SITE1 and TRPC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC1 BINDING SITE1 and TRPC1 BINDING SITE2, designated SEQ ID:9306 and SEQ ID:9308 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64798] Another function of VGAM1929 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM\_003304), a gene which acts as a non-voltage-sensitive store-operated  $\text{Ca}^{2+}$  channel. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC1. The function of TRPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Translin (TSN, Accession NM\_004622) is another VGAM1929 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10990, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64799] Another function of VGAM1929 is therefore inhibition of Translin (TSN, Accession NM\_004622), a gene which is a DNA binding protein and involved in DNA repair, replica-

tion, or recombination. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98. Thioredoxin Reductase 1 (TXNRD1, Accession NM\_003330) is another VGAM1929 host target gene. TXNRD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TXNRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TXNRD1 BINDING SITE, designated SEQ ID:9338, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64800] Another function of VGAM1929 is therefore inhibition of Thioredoxin Reductase 1 (TXNRD1, Accession NM\_003330), a gene which acts as an antioxidant enzyme and is involved in maintaining redox balance. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with TXNRD1. The function of TXNRD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Tyrosinase-related Protein 1 (TYRP1, Accession XM\_051267) is another VGAM1929 host target gene. TYRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TYRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TYRP1 BINDING SITE, designated SEQ ID:35796, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64801] Another function of VGAM1929 is therefore inhibition of Tyrosinase-related Protein 1 (TYRP1, Accession XM\_051267). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TYRP1. Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM\_130839) is another VGAM1929 host target gene. UBE3A BINDING SITE1 through UBE3A BINDING SITE3 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by UBE3A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3A BINDING SITE1 through UBE3A BINDING SITE3, designated SEQ ID:28366, SEQ ID:28362 and SEQ ID:6081 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64802] Another function of VGAM1929 is therefore inhibition of Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM\_130839). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3A. Uracil-DNA Glycosylase (UNG, Accession NM\_003362) is another VGAM1929 host target gene. UNG BINDING SITE1 and UNG BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UNG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNG BINDING SITE1 and UNG BINDING SITE2, designated

SEQ ID:9389 and SEQ ID:9416 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64803] Another function of VGAM1929 is therefore inhibition of Uracil–DNA Glycosylase (UNG, Accession NM\_003362), a gene which excises uracil residues from the dna to prevent mutagenesis and initiate the base–excision repair (BER) pathway. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNG. The function of UNG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Xylulokinase Homolog (H. influenzae) (XYLB, Accession NM\_005108) is another VGAM1929 host target gene. XYLB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XYLB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XYLB BINDING SITE, designated SEQ ID:11584, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64804] Another function of VGAM1929 is therefore inhibition of Xylulokinase Homolog (*H. influenzae*) (XYLB, Accession NM\_005108), a gene which is similar to *Haemophilus influenzae* xylulokinase and may play a role in energy metabolism. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XYLB. The function of XYLB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM\_012479) is another VGAM1929 host target gene. YWHAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAG BINDING SITE, designated SEQ ID:14854, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64805] Another function of VGAM1929 is therefore inhibition of

Tyrosine 3-monooxygenase/tryptophan

5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM\_012479), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of VGAM1929 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with YWHAG. The function of YWHAG

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Tyrosine

3-monooxygenase/tryptophan 5-monooxygenase Activa-

tion Protein, Eta Polypeptide (YWHAH, Accession

NM\_003405) is another VGAM1929 host target gene.

YWHAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

YWHAH, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of YWHAH BINDING SITE, designated SEQ

ID:9441, to the nucleotide sequence of VGAM1929 RNA,

herein designated VGAM RNA, also designated SEQ

ID:4640.

[64806] Another function of VGAM1929 is therefore inhibition of

Tyrosine 3-monooxygenase/tryptophan

5-monooxygenase Activation Protein, Eta Polypeptide

(YWHAH, Accession NM\_003405), a gene which activates tyrosine and tryptophan hydroxylases in the presence of and strongly activates protein kinase c. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAH. The function of YWHAH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923. Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM\_007222) is another VGAM1929 host target gene. ZHX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZHX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZHX1 BINDING SITE, designated SEQ ID:14093, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64807] Another function of VGAM1929 is therefore inhibition of Zinc-fingers and Homeoboxes 1 (ZHX1, Accession

NM\_007222). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZHX1. Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM\_168302) is another VGAM1929 host target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:45104, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64808] Another function of VGAM1929 is therefore inhibition of Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM\_168302), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM804. Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM\_007136)

is another VGAM1929 host target gene. ZNF80 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF80, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF80 BINDING SITE, designated SEQ ID:13988, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64809] Another function of VGAM1929 is therefore inhibition of Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM\_007136). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF80. ACP33 (Accession NM\_016630) is another VGAM1929 host target gene. ACP33 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACP33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACP33 BINDING SITE, designated SEQ ID:18744, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ

ID:4640.

[64810] Another function of VGAM1929 is therefore inhibition of ACP33 (Accession NM\_016630). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP33. AF311304 (Accession NM\_031214) is another VGAM1929 host target gene. AF311304 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AF311304, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF311304 BINDING SITE, designated SEQ ID:25260, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64811] Another function of VGAM1929 is therefore inhibition of AF311304 (Accession NM\_031214). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF311304. Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM\_024758) is another VGAM1929 host target gene. AGMAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by AGMAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGMAT BINDING SITE, designated SEQ ID:24107, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64812] Another function of VGAM1929 is therefore inhibition of Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM\_024758). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGMAT. A Kinase (PRKA) Anchor Protein 8 (AKAP8, Accession NM\_005858) is another VGAM1929 host target gene. AKAP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP8 BINDING SITE, designated SEQ ID:12464, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64813] Another function of VGAM1929 is therefore inhibition of A

Kinase (PRKA) Anchor Protein 8 (AKAP8, Accession NM\_005858). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP8. Adaptor-related Protein Complex 3, Mu 2 Subunit (AP3M2, Accession NM\_006803) is another VGAM1929 host target gene. AP3M2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP3M2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3M2 BINDING SITE, designated SEQ ID:13679, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64814] Another function of VGAM1929 is therefore inhibition of Adaptor-related Protein Complex 3, Mu 2 Subunit (AP3M2, Accession NM\_006803). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M2. Apolipoprotein L, 4 (APOL4, Accession NM\_030643) is another VGAM1929 host target gene. APOL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by APOL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL4 BINDING SITE, designated SEQ ID:24979, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64815] Another function of VGAM1929 is therefore inhibition of Apolipoprotein L, 4 (APOL4, Accession NM\_030643). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL4. Ras Homolog Gene Family, Member E (ARHE, Accession NM\_005168) is another VGAM1929 host target gene. ARHE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHE BINDING SITE, designated SEQ ID:11669, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64816] Another function of VGAM1929 is therefore inhibition of

Ras Homolog Gene Family, Member E (ARHE, Accession NM\_005168). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHE. Rho Guanine Nucleotide Exchange Factor (GEF) 3 (ARHGEF3, Accession NM\_019555) is another VGAM1929 host target gene. ARHGEF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF3 BINDING SITE, designated SEQ ID:21209, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64817] Another function of VGAM1929 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 3 (ARHGEF3, Accession NM\_019555). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF3. Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM\_015185) is another VGAM1929 host target gene. ARHGEF9 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF9 BINDING SITE, designated SEQ ID:17540, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64818] Another function of VGAM1929 is therefore inhibition of Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM\_015185). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF9. ARL8 (Accession XM\_167671) is another VGAM1929 host target gene. ARL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL8 BINDING SITE, designated SEQ ID:44762, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64819] Another function of VGAM1929 is therefore inhibition of ARL8 (Accession XM\_167671). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL8. ARNTL2 (Accession NM\_020183) is another VGAM1929 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21413, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64820] Another function of VGAM1929 is therefore inhibition of ARNTL2 (Accession NM\_020183). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. ATPase, Class V, Type 10B (ATP10B, Accession XM\_032721) is another VGAM1929 host target gene. ATP10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10B BINDING SITE, designated SEQ ID:31737, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64821] Another function of VGAM1929 is therefore inhibition of ATPase, Class V, Type 10B (ATP10B, Accession XM\_032721). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10B. ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577) is another VGAM1929 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31087, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64822] Another function of VGAM1929 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577).

Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. BCMP1 (Accession NM\_031442) is another VGAM1929 host target gene. BCMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:25456, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64823] Another function of VGAM1929 is therefore inhibition of BCMP1 (Accession NM\_031442). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1. Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM\_030809) is another VGAM1929 host target gene. C12orf22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C12orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C12orf22 BINDING SITE, designated SEQ ID:25126, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64824] Another function of VGAM1929 is therefore inhibition of Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM\_030809). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf22. Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM\_020456) is another VGAM1929 host target gene. C13orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C13orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:21691, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64825] Another function of VGAM1929 is therefore inhibition of Chromosome 13 Open Reading Frame 1 (C13orf1, Acces-

sion NM\_020456). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf1. Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM\_025191) is another VGAM1929 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24839, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64826] Another function of VGAM1929 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM\_025191). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966) is another VGAM1929 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27532, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64827] Another function of VGAM1929 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM\_029741) is another VGAM1929 host target gene. C20orf130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf130 BINDING SITE, designated SEQ ID:30938, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64828] Another function of VGAM1929 is therefore inhibition of Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM\_029741). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf130. Chromosome 21 Open Reading Frame 41 (C21orf41, Accession NM\_138332) is another VGAM1929 host target gene. C21orf41 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf41 BINDING SITE, designated SEQ ID:28730, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64829] Another function of VGAM1929 is therefore inhibition of Chromosome 21 Open Reading Frame 41 (C21orf41, Accession NM\_138332). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf41. Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM\_016605) is another VGAM1929 host target gene.

C5orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf6 BINDING SITE, designated SEQ ID:18702, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64830] Another function of VGAM1929 is therefore inhibition of Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM\_016605). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf6. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1929 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26070, to the nucleotide sequence of

VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64831] Another function of VGAM1929 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409) is another VGAM1929 host target gene. CCR6 BINDING SITE1 and CCR6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE1 and CCR6 BINDING SITE2, designated SEQ ID:25373 and SEQ ID:10579 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64832] Another function of VGAM1929 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with CCR6. CHFR (Accession NM\_018223) is another VGAM1929 host target gene. CHFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHFR BINDING SITE, designated SEQ ID:20150, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64833] Another function of VGAM1929 is therefore inhibition of CHFR (Accession NM\_018223). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHFR. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM\_005769) is another VGAM1929 host target gene. CHST4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST4 BINDING SITE, designated SEQ ID:12340, to the nucleotide sequence of

VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64834] Another function of VGAM1929 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM\_005769). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST4. Carbohydrate (chondroitin) Synthase 1 (CHSY1, Accession NM\_014918) is another VGAM1929 host target gene. CHSY1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHSY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHSY1 BINDING SITE, designated SEQ ID:17173, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64835] Another function of VGAM1929 is therefore inhibition of Carbohydrate (chondroitin) Synthase 1 (CHSY1, Accession NM\_014918). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHSY1. Cytoskeleton-associ-

ated Protein 4 (CKAP4, Accession NM\_006825) is another VGAM1929 host target gene. CKAP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKAP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKAP4 BINDING SITE, designated SEQ ID:13705, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64836] Another function of VGAM1929 is therefore inhibition of Cytoskeleton-associated Protein 4 (CKAP4, Accession NM\_006825). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKAP4. Claudin 4 (CLDN4, Accession NM\_001305) is another VGAM1929 host target gene. CLDN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN4 BINDING SITE, designated SEQ ID:6988, to the nucleotide sequence of VGAM1929 RNA,

herein designated VGAM RNA, also designated SEQ ID:4640.

[64837] Another function of VGAM1929 is therefore inhibition of Claudin 4 (CLDN4, Accession NM\_001305). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN4. Crn, Crooked Neck-like 1 (Drosophila) (CRNKL1, Accession NM\_016652) is another VGAM1929 host target gene. CRNKL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRNKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRNKL1 BINDING SITE, designated SEQ ID:18774, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64838] Another function of VGAM1929 is therefore inhibition of Crn, Crooked Neck-like 1 (Drosophila) (CRNKL1, Accession NM\_016652). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRNKL1. CTP Synthase II (CTPS2, Accession NM\_019857) is another VGAM1929

host target gene. CTPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTPS2 BINDING SITE, designated SEQ ID:21262, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64839] Another function of VGAM1929 is therefore inhibition of CTP Synthase II (CTPS2, Accession NM\_019857). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTPS2. D2S448 (Accession XM\_056455) is another VGAM1929 host target gene. D2S448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D2S448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D2S448 BINDING SITE, designated SEQ ID:36395, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64840] Another function of VGAM1929 is therefore inhibition of D2S448 (Accession XM\_056455). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D2S448. DJ971N18.2 (Accession NM\_021156) is another VGAM1929 host target gene. DJ971N18.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ971N18.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ971N18.2 BINDING SITE, designated SEQ ID:22134, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64841] Another function of VGAM1929 is therefore inhibition of DJ971N18.2 (Accession NM\_021156). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ971N18.2. DKFZP434C0826 (Accession XM\_097248) is another VGAM1929 host target gene. DKFZP434C0826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434C0826, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C0826 BINDING SITE, designated SEQ ID:40844, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64842] Another function of VGAM1929 is therefore inhibition of DKFZP434C0826 (Accession XM\_097248). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C0826. DKFZP434D1335 (Accession XM\_036578) is another VGAM1929 host target gene. DKFZP434D1335 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434D1335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434D1335 BINDING SITE, designated SEQ ID:32468, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64843] Another function of VGAM1929 is therefore inhibition of DKFZP434D1335 (Accession XM\_036578). Accordingly,

utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D1335. DKFZp434D177 (Accession NM\_032264) is another VGAM1929 host target gene. DKFZp434D177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434D177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434D177 BINDING SITE, designated SEQ ID:26010, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64844] Another function of VGAM1929 is therefore inhibition of DKFZp434D177 (Accession NM\_032264). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434D177. DKFZP434J1813 (Accession XM\_029798) is another VGAM1929 host target gene. DKFZP434J1813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434J1813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J1813 BINDING SITE, designated SEQ ID:30949, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64845] Another function of VGAM1929 is therefore inhibition of DKFZP434J1813 (Accession XM\_029798). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J1813. DKFZP434O125 (Accession XM\_036284) is another VGAM1929 host target gene. DKFZP434O125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434O125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O125 BINDING SITE, designated SEQ ID:32407, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64846] Another function of VGAM1929 is therefore inhibition of DKFZP434O125 (Accession XM\_036284). Accordingly, utilities of VGAM1929 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434O125. DKFZp547I224 (Accession NM\_020221) is another VGAM1929 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21477, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64847] Another function of VGAM1929 is therefore inhibition of DKFZp547I224 (Accession NM\_020221). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. DKFZP564I0422 (Accession NM\_031435) is another VGAM1929 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:25434, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64848] Another function of VGAM1929 is therefore inhibition of DKFZP564I0422 (Accession NM\_031435). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. DKFZP564L2423 (Accession XM\_031015) is another VGAM1929 host target gene. DKFZP564L2423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564L2423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564L2423 BINDING SITE, designated SEQ ID:31259, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64849] Another function of VGAM1929 is therefore inhibition of DKFZP564L2423 (Accession XM\_031015). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP564L2423. DKFZP564O0823 (Accession XM\_003517) is another VGAM1929 host target gene. DKFZP564O0823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0823 BINDING SITE, designated SEQ ID:29938, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64850] Another function of VGAM1929 is therefore inhibition of DKFZP564O0823 (Accession XM\_003517). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0823. DKFZp566H0824 (Accession NM\_017535) is another VGAM1929 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE,

designated SEQ ID:18979, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64851] Another function of VGAM1929 is therefore inhibition of DKFZp566H0824 (Accession NM\_017535). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. DKFZP727C091 (Accession XM\_038689) is another VGAM1929 host target gene. DKFZP727C091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP727C091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727C091 BINDING SITE, designated SEQ ID:32905, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64852] Another function of VGAM1929 is therefore inhibition of DKFZP727C091 (Accession XM\_038689). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727C091. DKFZp761D0614 (Accession

XM\_113634) is another VGAM1929 host target gene. DKFZp761D0614 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D0614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D0614 BINDING SITE, designated SEQ ID:42310, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64853] Another function of VGAM1929 is therefore inhibition of DKFZp761D0614 (Accession XM\_113634). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D0614. DKFZP761F241 (Accession NM\_031455) is another VGAM1929 host target gene. DKFZP761F241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761F241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761F241 BINDING SITE, designated SEQ ID:25478, to the nucleotide sequence of

VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64854] Another function of VGAM1929 is therefore inhibition of DKFZP761F241 (Accession NM\_031455). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761F241. DnaJ (Hsp40) Homolog, Subfamily A, Member 4 (DNAJA4, Accession NM\_018602) is another VGAM1929 host target gene. DNAJA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJA4 BINDING SITE, designated SEQ ID:20679, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64855] Another function of VGAM1929 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily A, Member 4 (DNAJA4, Accession NM\_018602). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJA4. DnaJ (Hsp40) Homolog, Subfamily C, Member 6

(DNAJC6, Accession NM\_014787) is another VGAM1929 host target gene. DNAJC6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAJC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC6 BINDING SITE, designated SEQ ID:16663, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64856] Another function of VGAM1929 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM\_014787). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC6. Dual Specificity Phosphatase 9 (DUSP9, Accession NM\_001395) is another VGAM1929 host target gene. DUSP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DUSP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP9 BINDING SITE, designated SEQ ID:7091,

to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64857] Another function of VGAM1929 is therefore inhibition of Dual Specificity Phosphatase 9 (DUSP9, Accession NM\_001395). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP9. Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM\_001969) is another VGAM1929 host target gene. EIF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5 BINDING SITE, designated SEQ ID:7702, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64858] Another function of VGAM1929 is therefore inhibition of Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM\_001969). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5. Elac Homolog 1 (E. coli) (ELAC1, Accession XM\_165659) is another

VGAM1929 host target gene. ELAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELAC1 BINDING SITE, designated SEQ ID:43723, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64859] Another function of VGAM1929 is therefore inhibition of ElaC Homolog 1 (E. coli) (ELAC1, Accession XM\_165659). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELAC1. E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM\_001421) is another VGAM1929 host target gene. ELF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF4 BINDING SITE, designated SEQ ID:7128, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also

designated SEQ ID:4640.

[64860] Another function of VGAM1929 is therefore inhibition of E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM\_001421). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF4. ESDN (Accession NM\_080927) is another VGAM1929 host target gene. ESDN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESDN BINDING SITE, designated SEQ ID:28152, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64861] Another function of VGAM1929 is therefore inhibition of ESDN (Accession NM\_080927). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESDN. Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665) is another VGAM1929 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12209, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64862] Another function of VGAM1929 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. FLJ10292 (Accession NM\_018048) is another VGAM1929 host target gene. FLJ10292 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10292 BINDING SITE, designated SEQ ID:19803, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64863] Another function of VGAM1929 is therefore inhibition of

FLJ10292 (Accession NM\_018048). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10292. FLJ10493 (Accession NM\_018112) is another VGAM1929 host target gene. FLJ10493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10493 BINDING SITE, designated SEQ ID:19885, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64864] Another function of VGAM1929 is therefore inhibition of FLJ10493 (Accession NM\_018112). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10493. FLJ10546 (Accession XM\_002989) is another VGAM1929 host target gene. FLJ10546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10546 BINDING SITE, designated SEQ ID:29913, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64865] Another function of VGAM1929 is therefore inhibition of FLJ10546 (Accession XM\_002989). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10546. FLJ10726 (Accession NM\_018195) is another VGAM1929 host target gene. FLJ10726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10726 BINDING SITE, designated SEQ ID:20061, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64866] Another function of VGAM1929 is therefore inhibition of FLJ10726 (Accession NM\_018195). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10726. FLJ10803 (Accession NM\_018224) is another

VGAM1929 host target gene. FLJ10803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10803 BINDING SITE, designated SEQ ID:20154, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64867] Another function of VGAM1929 is therefore inhibition of FLJ10803 (Accession NM\_018224). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10803. FLJ10852 (Accession NM\_019028) is another VGAM1929 host target gene. FLJ10852 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10852, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10852 BINDING SITE, designated SEQ ID:21119, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64868] Another function of VGAM1929 is therefore inhibition of FLJ10852 (Accession NM\_019028). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10852. FLJ10996 (Accession NM\_019044) is another VGAM1929 host target gene. FLJ10996 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10996 BINDING SITE, designated SEQ ID:21128, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64869] Another function of VGAM1929 is therefore inhibition of FLJ10996 (Accession NM\_019044). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10996. FLJ11184 (Accession NM\_018352) is another VGAM1929 host target gene. FLJ11184 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11184 BINDING SITE, designated SEQ ID:20365, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64870] Another function of VGAM1929 is therefore inhibition of FLJ11184 (Accession NM\_018352). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11184. FLJ12154 (Accession NM\_021944) is another VGAM1929 host target gene. FLJ12154 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12154 BINDING SITE, designated SEQ ID:22464, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64871] Another function of VGAM1929 is therefore inhibition of FLJ12154 (Accession NM\_021944). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ12154. FLJ12425 (Accession XM\_098290) is another VGAM1929 host target gene. FLJ12425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12425 BINDING SITE, designated SEQ ID:41565, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64872] Another function of VGAM1929 is therefore inhibition of FLJ12425 (Accession XM\_098290). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12425. FLJ12443 (Accession NM\_024830) is another VGAM1929 host target gene. FLJ12443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12443 BINDING SITE, designated SEQ ID:24226, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM

RNA, also designated SEQ ID:4640.

[64873] Another function of VGAM1929 is therefore inhibition of FLJ12443 (Accession NM\_024830). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12443. FLJ12581 (Accession NM\_024865) is another VGAM1929 host target gene. FLJ12581 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12581, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12581 BINDING SITE, designated SEQ ID:24302, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64874] Another function of VGAM1929 is therefore inhibition of FLJ12581 (Accession NM\_024865). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12581. FLJ12770 (Accession NM\_032174) is another VGAM1929 host target gene. FLJ12770 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12770, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12770 BINDING SITE, designated SEQ ID:25888, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64875] Another function of VGAM1929 is therefore inhibition of FLJ12770 (Accession NM\_032174). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12770. FLJ12895 (Accession NM\_023926) is another VGAM1929 host target gene. FLJ12895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12895 BINDING SITE, designated SEQ ID:23406, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64876] Another function of VGAM1929 is therefore inhibition of FLJ12895 (Accession NM\_023926). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12895. FLJ12903 (Accession NM\_022753) is another VGAM1929 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:22981, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64877] Another function of VGAM1929 is therefore inhibition of FLJ12903 (Accession NM\_022753). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903. FLJ13213 (Accession NM\_024755) is another VGAM1929 host target gene. FLJ13213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13213 BINDING SITE, designated SEQ ID:24100, to the nucleotide

sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64878] Another function of VGAM1929 is therefore inhibition of FLJ13213 (Accession NM\_024755). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13213. FLJ13315 (Accession NM\_025005) is another VGAM1929 host target gene. FLJ13315 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13315 BINDING SITE, designated SEQ ID:24578, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64879] Another function of VGAM1929 is therefore inhibition of FLJ13315 (Accession NM\_025005). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13315. FLJ13646 (Accession NM\_024584) is another VGAM1929 host target gene. FLJ13646 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ13646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13646 BINDING SITE, designated SEQ ID:23817, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64880] Another function of VGAM1929 is therefore inhibition of FLJ13646 (Accession NM\_024584). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13646. FLJ13842 (Accession NM\_024645) is another VGAM1929 host target gene. FLJ13842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13842 BINDING SITE, designated SEQ ID:23931, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64881] Another function of VGAM1929 is therefore inhibition of FLJ13842 (Accession NM\_024645). Accordingly, utilities of

VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13842. FLJ14466 (Accession NM\_032790) is another VGAM1929 host target gene. FLJ14466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14466 BINDING SITE, designated SEQ ID:26544, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64882] Another function of VGAM1929 is therefore inhibition of FLJ14466 (Accession NM\_032790). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14466. FLJ14564 (Accession XM\_084459) is another VGAM1929 host target gene. FLJ14564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14564

BINDING SITE, designated SEQ ID:37597, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64883] Another function of VGAM1929 is therefore inhibition of FLJ14564 (Accession XM\_084459). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14564. FLJ14621 (Accession NM\_032811) is another VGAM1929 host target gene. FLJ14621 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14621 BINDING SITE, designated SEQ ID:26583, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64884] Another function of VGAM1929 is therefore inhibition of FLJ14621 (Accession NM\_032811). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14621. FLJ20232 (Accession NM\_019008) is another VGAM1929 host target gene. FLJ20232 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20232 BINDING SITE, designated SEQ ID:21084, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64885] Another function of VGAM1929 is therefore inhibition of FLJ20232 (Accession NM\_019008). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232. FLJ20273 (Accession NM\_019027) is another VGAM1929 host target gene. FLJ20273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20273 BINDING SITE, designated SEQ ID:21116, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64886] Another function of VGAM1929 is therefore inhibition of

FLJ20273 (Accession NM\_019027). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20273. FLJ20337 (Accession NM\_017772) is another VGAM1929 host target gene. FLJ20337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20337 BINDING SITE, designated SEQ ID:19393, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64887] Another function of VGAM1929 is therefore inhibition of FLJ20337 (Accession NM\_017772). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20337. FLJ20508 (Accession NM\_017850) is another VGAM1929 host target gene. FLJ20508 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ20508 BINDING SITE, designated SEQ ID:19520, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64888] Another function of VGAM1929 is therefore inhibition of FLJ20508 (Accession NM\_017850). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20508. FLJ20509 (Accession NM\_017851) is another VGAM1929 host target gene. FLJ20509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20509 BINDING SITE, designated SEQ ID:19524, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64889] Another function of VGAM1929 is therefore inhibition of FLJ20509 (Accession NM\_017851). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20509. FLJ20542 (Accession NM\_032179) is another

VGAM1929 host target gene. FLJ20542 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20542, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20542 BINDING SITE, designated SEQ ID:25893, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64890] Another function of VGAM1929 is therefore inhibition of FLJ20542 (Accession NM\_032179). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20542. FLJ20666 (Accession NM\_018333) is another VGAM1929 host target gene. FLJ20666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE, designated SEQ ID:20338, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64891] Another function of VGAM1929 is therefore inhibition of FLJ20666 (Accession NM\_018333). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666. FLJ20700 (Accession NM\_017932) is another VGAM1929 host target gene. FLJ20700 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20700 BINDING SITE, designated SEQ ID:19620, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64892] Another function of VGAM1929 is therefore inhibition of FLJ20700 (Accession NM\_017932). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20700. FLJ20793 (Accession XM\_166296) is another VGAM1929 host target gene. FLJ20793 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20793 BINDING SITE, designated SEQ ID:44109, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64893] Another function of VGAM1929 is therefore inhibition of FLJ20793 (Accession XM\_166296). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20793. FLJ20972 (Accession NM\_025030) is another VGAM1929 host target gene. FLJ20972 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20972 BINDING SITE, designated SEQ ID:24626, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64894] Another function of VGAM1929 is therefore inhibition of FLJ20972 (Accession NM\_025030). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20972. FLJ21032 (Accession NM\_024906) is another VGAM1929 host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21032 BINDING SITE, designated SEQ ID:24400, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64895] Another function of VGAM1929 is therefore inhibition of FLJ21032 (Accession NM\_024906). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. FLJ21477 (Accession NM\_025153) is another VGAM1929 host target gene. FLJ21477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21477 BINDING SITE, designated SEQ ID:24790, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM

RNA, also designated SEQ ID:4640.

[64896] Another function of VGAM1929 is therefore inhibition of FLJ21477 (Accession NM\_025153). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21477. FLJ21551 (Accession NM\_024801) is another VGAM1929 host target gene. FLJ21551 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21551 BINDING SITE, designated SEQ ID:24179, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64897] Another function of VGAM1929 is therefore inhibition of FLJ21551 (Accession NM\_024801). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21551. FLJ21615 (Accession NM\_032205) is another VGAM1929 host target gene. FLJ21615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21615, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21615 BINDING SITE, designated SEQ ID:25910, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64898] Another function of VGAM1929 is therefore inhibition of FLJ21615 (Accession NM\_032205). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21615. FLJ21777 (Accession NM\_032209) is another VGAM1929 host target gene. FLJ21777 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21777 BINDING SITE, designated SEQ ID:25925, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64899] Another function of VGAM1929 is therefore inhibition of FLJ21777 (Accession NM\_032209). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ21777. FLJ22028 (Accession NM\_024854) is another VGAM1929 host target gene. FLJ22028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22028 BINDING SITE, designated SEQ ID:24285, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64900] Another function of VGAM1929 is therefore inhibition of FLJ22028 (Accession NM\_024854). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22028. FLJ22055 (Accession NM\_024779) is another VGAM1929 host target gene. FLJ22055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22055 BINDING SITE, designated SEQ ID:24148, to the nucleotide

sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64901] Another function of VGAM1929 is therefore inhibition of FLJ22055 (Accession NM\_024779). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22055. FLJ22169 (Accession NM\_024085) is another VGAM1929 host target gene. FLJ22169 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:23522, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64902] Another function of VGAM1929 is therefore inhibition of FLJ22169 (Accession NM\_024085). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169. FLJ22724 (Accession NM\_024532) is another VGAM1929 host target gene. FLJ22724 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ22724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22724 BINDING SITE, designated SEQ ID:23736, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64903] Another function of VGAM1929 is therefore inhibition of FLJ22724 (Accession NM\_024532). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22724. FLJ30058 (Accession NM\_144967) is another VGAM1929 host target gene. FLJ30058 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30058 BINDING SITE, designated SEQ ID:29583, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64904] Another function of VGAM1929 is therefore inhibition of FLJ30058 (Accession NM\_144967). Accordingly, utilities of

VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30058. Frequenin Homolog (Drosophila) (FREQ, Accession NM\_014286) is another VGAM1929 host target gene. FREQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FREQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREQ BINDING SITE, designated SEQ ID:15565, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64905] Another function of VGAM1929 is therefore inhibition of Frequenin Homolog (Drosophila) (FREQ, Accession NM\_014286). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREQ. Far Upstream Element (FUSE) Binding Protein 3 (FUBP3, Accession XM\_033327) is another VGAM1929 host target gene. FUBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of FUBP3 BINDING SITE, designated SEQ ID:31878, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64906] Another function of VGAM1929 is therefore inhibition of Far Upstream Element (FUSE) Binding Protein 3 (FUBP3, Accession XM\_033327). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUBP3. Fucosyltransferase 10 (alpha (1,3) Fucosyltransferase) (FUT10, Accession NM\_032664) is another VGAM1929 host target gene. FUT10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT10 BINDING SITE, designated SEQ ID:26394, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64907] Another function of VGAM1929 is therefore inhibition of Fucosyltransferase 10 (alpha (1,3) Fucosyltransferase)

(FUT10, Accession NM\_032664). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT10. G2 (Accession XM\_039515) is another VGAM1929 host target gene. G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G2 BINDING SITE, designated SEQ ID:33111, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64908] Another function of VGAM1929 is therefore inhibition of G2 (Accession XM\_039515). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G2. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM\_022130) is another VGAM1929 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GOLPH3 BINDING SITE, designated SEQ ID:22690, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64909] Another function of VGAM1929 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM\_022130). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. G Protein-coupled Receptor 107 (GPR107, Accession NM\_020960) is another VGAM1929 host target gene. GPR107 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR107 BINDING SITE, designated SEQ ID:21949, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64910] Another function of VGAM1929 is therefore inhibition of G Protein-coupled Receptor 107 (GPR107, Accession NM\_020960). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with GPR107. GS3955 (Accession NM\_021643) is another VGAM1929 host target gene. GS3955 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GS3955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GS3955 BINDING SITE, designated SEQ ID:22307, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64911] Another function of VGAM1929 is therefore inhibition of GS3955 (Accession NM\_021643). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GS3955. H2AV (Accession NM\_138635) is another VGAM1929 host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2AV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:28910, to the nucleotide sequence of

VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64912] Another function of VGAM1929 is therefore inhibition of H2AV (Accession NM\_138635). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV. H326 (Accession NM\_015726) is another VGAM1929 host target gene. H326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H326 BINDING SITE, designated SEQ ID:17941, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64913] Another function of VGAM1929 is therefore inhibition of H326 (Accession NM\_015726). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H326. HEMK (Accession NM\_016173) is another VGAM1929 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18268, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64914] Another function of VGAM1929 is therefore inhibition of HEMK (Accession NM\_016173). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM\_005758) is another VGAM1929 host target gene. HNRPA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA3 BINDING SITE, designated SEQ ID:12326, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64915] Another function of VGAM1929 is therefore inhibition of

Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM\_005758). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPA3. HOMER-2B (Accession NM\_004839) is another VGAM1929 host target gene. HOMER-2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOMER-2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOMER-2B BINDING SITE, designated SEQ ID:11247, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64916] Another function of VGAM1929 is therefore inhibition of HOMER-2B (Accession NM\_004839). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOMER-2B. HPIP (Accession NM\_020524) is another VGAM1929 host target gene. HPIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPIP BINDING SITE, designated SEQ ID:21737, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64917] Another function of VGAM1929 is therefore inhibition of HPIP (Accession NM\_020524). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPIP. HSA249128 (Accession NM\_017583) is another VGAM1929 host target gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19025, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64918] Another function of VGAM1929 is therefore inhibition of HSA249128 (Accession NM\_017583). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

HSA249128. HSA277841 (Accession NM\_018553) is another VGAM1929 host target gene. HSA277841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA277841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA277841 BINDING SITE, designated SEQ ID:20633, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64919] Another function of VGAM1929 is therefore inhibition of HSA277841 (Accession NM\_018553). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA277841. HSPC129 (Accession NM\_016396) is another VGAM1929 host target gene. HSPC129 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC129 BINDING SITE, designated SEQ ID:18535, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM

RNA, also designated SEQ ID:4640.

[64920] Another function of VGAM1929 is therefore inhibition of HSPC129 (Accession NM\_016396). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC129. Internexin Neuronal Intermediate Filament Protein, Alpha (INA, Accession NM\_032727) is another VGAM1929 host target gene. INA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INA BINDING SITE, designated SEQ ID:26453, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64921] Another function of VGAM1929 is therefore inhibition of Internexin Neuronal Intermediate Filament Protein, Alpha (INA, Accession NM\_032727). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INA. Inhibitor of Growth Family, Member 4 (ING4, Accession XM\_006980) is another VGAM1929 host target gene. ING4

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ING4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ING4 BINDING SITE, designated SEQ ID:30026, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64922] Another function of VGAM1929 is therefore inhibition of Inhibitor of Growth Family, Member 4 (ING4, Accession XM\_006980). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ING4. K-ALPHA-1 (Accession XM\_084866) is another VGAM1929 host target gene. K-ALPHA-1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by K-ALPHA-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of K-ALPHA-1 BINDING SITE, designated SEQ ID:37742, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64923] Another function of VGAM1929 is therefore inhibition of K-ALPHA-1 (Accession XM\_084866). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with K-ALPHA-1. KIAA0087 (Accession NM\_014769) is another VGAM1929 host target gene. KIAA0087 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:16560, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64924] Another function of VGAM1929 is therefore inhibition of KIAA0087 (Accession NM\_014769). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087. KIAA0185 (Accession XM\_031992) is another VGAM1929 host target gene. KIAA0185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0185, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0185 BINDING SITE, designated SEQ ID:31538, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64925] Another function of VGAM1929 is therefore inhibition of KIAA0185 (Accession XM\_031992). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0185. KIAA0186 (Accession NM\_021067) is another VGAM1929 host target gene. KIAA0186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0186 BINDING SITE, designated SEQ ID:22038, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64926] Another function of VGAM1929 is therefore inhibition of KIAA0186 (Accession NM\_021067). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0186. KIAA0215 (Accession NM\_014735) is another VGAM1929 host target gene. KIAA0215 BINDING SITE1 and KIAA0215 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0215, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0215 BINDING SITE1 and KIAA0215 BINDING SITE2, designated SEQ ID:16383 and SEQ ID:16386 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64927] Another function of VGAM1929 is therefore inhibition of KIAA0215 (Accession NM\_014735). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0215. KIAA0255 (Accession NM\_014742) is another VGAM1929 host target gene. KIAA0255 BINDING SITE1 and KIAA0255 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0255, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA0255 BINDING SITE1 and KIAA0255 BINDING SITE2, designated SEQ ID:16418 and SEQ ID:34626 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64928] Another function of VGAM1929 is therefore inhibition of KIAA0255 (Accession NM\_014742). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0255. KIAA0318 (Accession XM\_044334) is another VGAM1929 host target gene. KIAA0318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0318 BINDING SITE, designated SEQ ID:34190, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64929] Another function of VGAM1929 is therefore inhibition of KIAA0318 (Accession XM\_044334). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0318. KIAA0323 (Accession XM\_032634) is another VGAM1929 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31693, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64930] Another function of VGAM1929 is therefore inhibition of KIAA0323 (Accession XM\_032634). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA0349 (Accession XM\_166449) is another VGAM1929 host target gene. KIAA0349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0349 BINDING SITE, designated SEQ ID:44343, to the nucleotide sequence of VGAM1929 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4640.

[64931] Another function of VGAM1929 is therefore inhibition of KIAA0349 (Accession XM\_166449). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0349. KIAA0417 (Accession XM\_048898) is another VGAM1929 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0417 BINDING SITE, designated SEQ ID:35290, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64932] Another function of VGAM1929 is therefore inhibition of KIAA0417 (Accession XM\_048898). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. KIAA0431 (Accession NM\_015251) is another VGAM1929 host target gene. KIAA0431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0431, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0431 BINDING SITE, designated SEQ ID:17579, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64933] Another function of VGAM1929 is therefore inhibition of KIAA0431 (Accession NM\_015251). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0431. KIAA0435 (Accession NM\_014801) is another VGAM1929 host target gene. KIAA0435 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0435 BINDING SITE, designated SEQ ID:16719, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64934] Another function of VGAM1929 is therefore inhibition of KIAA0435 (Accession NM\_014801). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0435. KIAA0446 (Accession XM\_044155) is another VGAM1929 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34156, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64935] Another function of VGAM1929 is therefore inhibition of KIAA0446 (Accession XM\_044155). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. KIAA0494 (Accession NM\_014774) is another VGAM1929 host target gene. KIAA0494 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0494 BINDING SITE, designated SEQ ID:16594, to the

nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64936] Another function of VGAM1929 is therefore inhibition of KIAA0494 (Accession NM\_014774). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0494. KIAA0515 (Accession XM\_033380) is another VGAM1929 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31923, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64937] Another function of VGAM1929 is therefore inhibition of KIAA0515 (Accession XM\_033380). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA0522 (Accession XM\_050404) is another VGAM1929 host target gene. KIAA0522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0522 BINDING SITE, designated SEQ ID:35623, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64938] Another function of VGAM1929 is therefore inhibition of KIAA0522 (Accession XM\_050404). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0522. KIAA0682 (Accession NM\_014852) is another VGAM1929 host target gene. KIAA0682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:16902, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64939] Another function of VGAM1929 is therefore inhibition of KIAA0682 (Accession NM\_014852). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682. KIAA0802 (Accession XM\_031357) is another VGAM1929 host target gene. KIAA0802 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0802 BINDING SITE, designated SEQ ID:31354, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64940] Another function of VGAM1929 is therefore inhibition of KIAA0802 (Accession XM\_031357). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0802. KIAA0825 (Accession XM\_027906) is another VGAM1929 host target gene. KIAA0825 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0825, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0825 BINDING SITE, designated SEQ ID:30595, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64941] Another function of VGAM1929 is therefore inhibition of KIAA0825 (Accession XM\_027906). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825. KIAA0844 (Accession NM\_014951) is another VGAM1929 host target gene. KIAA0844 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0844 BINDING SITE, designated SEQ ID:17286, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64942] Another function of VGAM1929 is therefore inhibition of KIAA0844 (Accession NM\_014951). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0844. KIAA0848 (Accession NM\_014926) is another VGAM1929 host target gene. KIAA0848 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0848 BINDING SITE, designated SEQ ID:17215, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64943] Another function of VGAM1929 is therefore inhibition of KIAA0848 (Accession NM\_014926). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0848. KIAA0854 (Accession NM\_014943) is another VGAM1929 host target gene. KIAA0854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0854 BINDING SITE, designated SEQ ID:17254, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64944] Another function of VGAM1929 is therefore inhibition of

KIAA0854 (Accession NM\_014943). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0854. KIAA0865 (Accession XM\_028522) is another VGAM1929 host target gene. KIAA0865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0865 BINDING SITE, designated SEQ ID:30712, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64945] Another function of VGAM1929 is therefore inhibition of KIAA0865 (Accession XM\_028522). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0865. KIAA0882 (Accession XM\_093895) is another VGAM1929 host target gene. KIAA0882 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0882 BINDING SITE, designated SEQ ID:40217, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64946] Another function of VGAM1929 is therefore inhibition of KIAA0882 (Accession XM\_093895). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0882. KIAA0894 (Accession NM\_014896) is another VGAM1929 host target gene. KIAA0894 BINDING SITE1 and KIAA0894 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0894, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0894 BINDING SITE1 and KIAA0894 BINDING SITE2, designated SEQ ID:17059 and SEQ ID:17060 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64947] Another function of VGAM1929 is therefore inhibition of KIAA0894 (Accession NM\_014896). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0894. KIAA0931 (Accession XM\_041191) is another VGAM1929 host target gene. KIAA0931 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:33489, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64948] Another function of VGAM1929 is therefore inhibition of KIAA0931 (Accession XM\_041191). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931. KIAA1033 (Accession XM\_035313) is another VGAM1929 host target gene. KIAA1033 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1033 BINDING SITE, designated SEQ ID:32230, to the

nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64949] Another function of VGAM1929 is therefore inhibition of KIAA1033 (Accession XM\_035313). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1033. KIAA1034 (Accession XM\_031223) is another VGAM1929 host target gene. KIAA1034 BINDING SITE1 and KIAA1034 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1034, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1034 BINDING SITE1 and KIAA1034 BINDING SITE2, designated SEQ ID:31309 and SEQ ID:31312 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64950] Another function of VGAM1929 is therefore inhibition of KIAA1034 (Accession XM\_031223). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1034. KIAA1040 (Accession XM\_051091) is another

VGAM1929 host target gene. KIAA1040 BINDING SITE1 and KIAA1040 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1040, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1040 BINDING SITE1 and KIAA1040 BINDING SITE2, designated SEQ ID:35747 and SEQ ID:33954 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64951] Another function of VGAM1929 is therefore inhibition of KIAA1040 (Accession XM\_051091). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. KIAA1164 (Accession XM\_045358) is another VGAM1929 host target gene. KIAA1164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:34443, to the

nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64952] Another function of VGAM1929 is therefore inhibition of KIAA1164 (Accession XM\_045358). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1164. KIAA1190 (Accession XM\_048695) is another VGAM1929 host target gene. KIAA1190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1190 BINDING SITE, designated SEQ ID:35227, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64953] Another function of VGAM1929 is therefore inhibition of KIAA1190 (Accession XM\_048695). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1190. KIAA1200 (Accession XM\_031054) is another VGAM1929 host target gene. KIAA1200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1200 BINDING SITE, designated SEQ ID:31263, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64954] Another function of VGAM1929 is therefore inhibition of KIAA1200 (Accession XM\_031054). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1200. KIAA1223 (Accession XM\_048747) is another VGAM1929 host target gene. KIAA1223 BINDING SITE1 and KIAA1223 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1223, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE1 and KIAA1223 BINDING SITE2, designated SEQ ID:35248 and SEQ ID:35251 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64955] Another function of VGAM1929 is therefore inhibition of KIAA1223 (Accession XM\_048747). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. KIAA1280 (Accession XM\_045766) is another VGAM1929 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34552, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64956] Another function of VGAM1929 is therefore inhibition of KIAA1280 (Accession XM\_045766). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. KIAA1297 (Accession XM\_051005) is another VGAM1929 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35721, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64957] Another function of VGAM1929 is therefore inhibition of KIAA1297 (Accession XM\_051005). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KIAA1318 (Accession XM\_041080) is another VGAM1929 host target gene. KIAA1318 BINDING SITE1 and KIAA1318 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1318, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1318 BINDING SITE1 and KIAA1318 BINDING SITE2, designated SEQ ID:33430 and SEQ ID:33431 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64958] Another function of VGAM1929 is therefore inhibition of KIAA1318 (Accession XM\_041080). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1318. KIAA1434 (Accession XM\_045585) is another VGAM1929 host target gene. KIAA1434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1434 BINDING SITE, designated SEQ ID:34490, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64959] Another function of VGAM1929 is therefore inhibition of KIAA1434 (Accession XM\_045585). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1434. KIAA1437 (Accession XM\_026998) is another VGAM1929 host target gene. KIAA1437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1437 BINDING SITE, designated SEQ ID:30385, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64960] Another function of VGAM1929 is therefore inhibition of KIAA1437 (Accession XM\_026998). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1437. KIAA1492 (Accession XM\_035312) is another VGAM1929 host target gene. KIAA1492 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1492 BINDING SITE, designated SEQ ID:32227, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64961] Another function of VGAM1929 is therefore inhibition of KIAA1492 (Accession XM\_035312). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1492. KIAA1495 (Accession XM\_055080) is another VGAM1929 host target gene. KIAA1495 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1495 BINDING SITE, designated SEQ ID:36227, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64962] Another function of VGAM1929 is therefore inhibition of KIAA1495 (Accession XM\_055080). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1495. KIAA1509 (Accession XM\_029353) is another VGAM1929 host target gene. KIAA1509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:30878, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64963] Another function of VGAM1929 is therefore inhibition of

KIAA1509 (Accession XM\_029353). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509. KIAA1511 (Accession XM\_046581) is another VGAM1929 host target gene. KIAA1511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1511 BINDING SITE, designated SEQ ID:34757, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64964] Another function of VGAM1929 is therefore inhibition of KIAA1511 (Accession XM\_046581). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1511. KIAA1530 (Accession XM\_042661) is another VGAM1929 host target gene. KIAA1530 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:33732, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64965] Another function of VGAM1929 is therefore inhibition of KIAA1530 (Accession XM\_042661). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530. KIAA1559 (Accession XM\_054472) is another VGAM1929 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:36162, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64966] Another function of VGAM1929 is therefore inhibition of KIAA1559 (Accession XM\_054472). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. KIAA1577 (Accession XM\_035299) is another

VGAM1929 host target gene. KIAA1577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1577 BINDING SITE, designated SEQ ID:32211, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64967] Another function of VGAM1929 is therefore inhibition of KIAA1577 (Accession XM\_035299). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1577. KIAA1677 (Accession XM\_040383) is another VGAM1929 host target gene. KIAA1677 BINDING SITE1 and KIAA1677 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1677, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1677 BINDING SITE1 and KIAA1677 BINDING SITE2, designated SEQ ID:33291 and SEQ ID:33294 respectively, to the nucleotide sequence of

VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64968] Another function of VGAM1929 is therefore inhibition of KIAA1677 (Accession XM\_040383). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1677. KIAA1826 (Accession XM\_040784) is another VGAM1929 host target gene. KIAA1826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1826 BINDING SITE, designated SEQ ID:33379, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64969] Another function of VGAM1929 is therefore inhibition of KIAA1826 (Accession XM\_040784). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1826. KIAA1831 (Accession XM\_033366) is another VGAM1929 host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:31903, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64970] Another function of VGAM1929 is therefore inhibition of KIAA1831 (Accession XM\_033366). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1831. KIAA1878 (Accession XM\_166256) is another VGAM1929 host target gene. KIAA1878 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1878 BINDING SITE, designated SEQ ID:44076, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64971] Another function of VGAM1929 is therefore inhibition of KIAA1878 (Accession XM\_166256). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1878. KIAA1987 (Accession XM\_113870) is another VGAM1929 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42496, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64972] Another function of VGAM1929 is therefore inhibition of KIAA1987 (Accession XM\_113870). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. Karyopherin (importin) Beta 3 (KPNB3, Accession NM\_002271) is another VGAM1929 host target gene. KPNB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KPNB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of KPNB3 BINDING SITE, designated SEQ ID:8064, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64973] Another function of VGAM1929 is therefore inhibition of Karyopherin (importin) Beta 3 (KPNB3, Accession NM\_002271). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNB3. Leptin Receptor Overlapping Transcript-like 1 (LEPROTL1, Accession NM\_015344) is another VGAM1929 host target gene. LEPROTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEPROTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEPROTL1 BINDING SITE, designated SEQ ID:17651, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64974] Another function of VGAM1929 is therefore inhibition of Leptin Receptor Overlapping Transcript-like 1 (LEPROTL1, Accession NM\_015344). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LEP-ROTL1. LIG-1 (Accession XM\_033712) is another VGAM1929 host target gene. LIG-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIG-1 BINDING SITE, designated SEQ ID:31955, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64975] Another function of VGAM1929 is therefore inhibition of LIG-1 (Accession XM\_033712). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG-1. Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM\_018557) is another VGAM1929 host target gene. LRP1B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1B BINDING SITE,

designated SEQ ID:20638, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64976] Another function of VGAM1929 is therefore inhibition of Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM\_018557). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP1B. Leucine Rich Repeat (in FLII) Interacting Protein 2 (LRRFIP2, Accession NM\_017724) is another VGAM1929 host target gene. LRRFIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRRFIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRFIP2 BINDING SITE, designated SEQ ID:19313, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64977] Another function of VGAM1929 is therefore inhibition of Leucine Rich Repeat (in FLII) Interacting Protein 2 (LRRFIP2, Accession NM\_017724). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LR-RFIP2. Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM\_012090) is another VGAM1929 host target gene. MACF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MACF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACF1 BINDING SITE, designated SEQ ID:14377, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64978] Another function of VGAM1929 is therefore inhibition of Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM\_012090). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACF1. Mitogen-activated Protein Kinase Kinase Kinase Kinase 3 (MAP4K3, Accession NM\_003618) is another VGAM1929 host target gene. MAP4K3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP4K3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MAP4K3 BINDING SITE, designated SEQ ID:9681, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64979] Another function of VGAM1929 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP4K3, Accession NM\_003618). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP4K3. Methionine Adenosyltransferase II, Beta (MAT2B, Accession NM\_013283) is another VGAM1929 host target gene. MAT2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAT2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAT2B BINDING SITE, designated SEQ ID:14955, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64980] Another function of VGAM1929 is therefore inhibition of Methionine Adenosyltransferase II, Beta (MAT2B, Acces-

sion NM\_013283). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAT2B. MCM10 Minichromosome Maintenance Deficient 10 (*S. cerevisiae*) (MCM10, Accession NM\_018518) is another VGAM1929 host target gene. MCM10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCM10 BINDING SITE, designated SEQ ID:20593, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64981] Another function of VGAM1929 is therefore inhibition of MCM10 Minichromosome Maintenance Deficient 10 (*S. cerevisiae*) (MCM10, Accession NM\_018518). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCM10. MGC1203 (Accession NM\_024296) is another VGAM1929 host target gene. MGC1203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC1203, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1203 BINDING SITE, designated SEQ ID:23576, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64982] Another function of VGAM1929 is therefore inhibition of MGC1203 (Accession NM\_024296). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1203. MGC13090 (Accession NM\_032711) is another VGAM1929 host target gene. MGC13090 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13090 BINDING SITE, designated SEQ ID:26426, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64983] Another function of VGAM1929 is therefore inhibition of MGC13090 (Accession NM\_032711). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC13090. MGC16075 (Accession NM\_032761) is another VGAM1929 host target gene. MGC16075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16075 BINDING SITE, designated SEQ ID:26504, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64984] Another function of VGAM1929 is therefore inhibition of MGC16075 (Accession NM\_032761). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16075. MGC2474 (Accession NM\_023931) is another VGAM1929 host target gene. MGC2474 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:23418, to the nucleotide

sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64985] Another function of VGAM1929 is therefore inhibition of MGC2474 (Accession NM\_023931). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474. MGC3329 (Accession NM\_024086) is another VGAM1929 host target gene. MGC3329 BINDING SITE1 and MGC3329 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC3329, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3329 BINDING SITE1 and MGC3329 BINDING SITE2, designated SEQ ID:23527 and SEQ ID:23529 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64986] Another function of VGAM1929 is therefore inhibition of MGC3329 (Accession NM\_024086). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3329. MGC5508 (Accession NM\_024092) is another

VGAM1929 host target gene. MGC5508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5508 BINDING SITE, designated SEQ ID:23535, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64987] Another function of VGAM1929 is therefore inhibition of MGC5508 (Accession NM\_024092). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5508. Myeloid/lymphoid Or Mixed-lineage Leukemia3 (MLL3, Accession NM\_021230) is another VGAM1929 host target gene. MLL3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MLL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLL3 BINDING SITE, designated SEQ ID:22202, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4640.

[64988] Another function of VGAM1929 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia3 (MLL3, Accession NM\_021230). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLL3. N-acetylated Alpha-linked Acidic Dipeptidase 2 (NAALAD2, Accession NM\_005467) is another VGAM1929 host target gene. NAALAD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAALAD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAALAD2 BINDING SITE, designated SEQ ID:11964, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64989] Another function of VGAM1929 is therefore inhibition of N-acetylated Alpha-linked Acidic Dipeptidase 2 (NAALAD2, Accession NM\_005467). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAALAD2. NFASC (Accession XM\_046808) is another

VGAM1929 host target gene. NFASC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFASC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFASC BINDING SITE, designated SEQ ID:34830, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64990] Another function of VGAM1929 is therefore inhibition of NFASC (Accession XM\_046808). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFASC. NIBAN (Accession NM\_022083) is another VGAM1929 host target gene. NIBAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIBAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIBAN BINDING SITE, designated SEQ ID:22629, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64991] Another function of VGAM1929 is therefore inhibition of NIBAN (Accession NM\_022083). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIBAN. Nicolin 1 (NICN1, Accession NM\_032316) is another VGAM1929 host target gene. NICN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NICN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NICN1 BINDING SITE, designated SEQ ID:26117, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64992] Another function of VGAM1929 is therefore inhibition of Nicolin 1 (NICN1, Accession NM\_032316). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NICN1. NKX2B (Accession NM\_002509) is another VGAM1929 host target gene. NKX2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKX2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX2B BINDING SITE, designated SEQ ID:8344, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64993] Another function of VGAM1929 is therefore inhibition of NKX2B (Accession NM\_002509). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX2B. NRF (Accession NM\_017544) is another VGAM1929 host target gene. NRF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRF BINDING SITE, designated SEQ ID:18989, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64994] Another function of VGAM1929 is therefore inhibition of NRF (Accession NM\_017544). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRF.

NY-REN-25 (Accession XM\_027116) is another VGAM1929 host target gene. NY-REN-25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NY-REN-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-25 BINDING SITE, designated SEQ ID:30416, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64995] Another function of VGAM1929 is therefore inhibition of NY-REN-25 (Accession XM\_027116). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-25. NY-REN-41 (Accession NM\_080654) is another VGAM1929 host target gene. NY-REN-41 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NY-REN-41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-41 BINDING SITE, designated SEQ ID:27942, to the nucleotide sequence of VGAM1929 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4640.

[64996] Another function of VGAM1929 is therefore inhibition of NY-REN-41 (Accession NM\_080654). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-41. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550) is another VGAM1929 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:17821, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64997] Another function of VGAM1929 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. P450RAI-2 (Accession NM\_019885) is another VGAM1929 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:21272, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64998] Another function of VGAM1929 is therefore inhibition of P450RAI-2 (Accession NM\_019885). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. poly(A) Binding Protein, Cytoplasmic 5 (PABPC5, Accession NM\_080832) is another VGAM1929 host target gene. PABPC5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PABPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PABPC5 BINDING SITE, designated SEQ ID:28096, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[64999] Another function of VGAM1929 is therefore inhibition of poly(A) Binding Protein, Cytoplasmic 5 (PABPC5, Accession NM\_080832). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PABPC5. PC4 (Accession NM\_006713) is another VGAM1929 host target gene. PC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PC4 BINDING SITE, designated SEQ ID:13541, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65000] Another function of VGAM1929 is therefore inhibition of PC4 (Accession NM\_006713). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PC4. Protocadherin 19 (PCDH19, Accession XM\_033173) is another VGAM1929 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31864, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65001] Another function of VGAM1929 is therefore inhibition of Protocadherin 19 (PCDH19, Accession XM\_033173). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH19. Period Homolog 3 (Drosophila) (PER3, Accession NM\_016831) is another VGAM1929 host target gene. PER3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER3 BINDING SITE, designated SEQ ID:18823, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65002] Another function of VGAM1929 is therefore inhibition of Period Homolog 3 (Drosophila) (PER3, Accession NM\_016831). Accordingly, utilities of VGAM1929 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PER3. Phytoceramidase, Alkaline (PHCA, Accession NM\_018367) is another VGAM1929 host target gene. PHCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHCA BINDING SITE, designated SEQ ID:20379, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65003] Another function of VGAM1929 is therefore inhibition of Phytoceramidase, Alkaline (PHCA, Accession NM\_018367). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHCA. PHRET1 (Accession NM\_021200) is another VGAM1929 host target gene. PHRET1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHRET1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PHRET1 BINDING SITE, designated SEQ ID:22177, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65004] Another function of VGAM1929 is therefore inhibition of PHRET1 (Accession NM\_021200). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHRET1. Protease Inhibitor 15 (PI15, Accession NM\_015886) is another VGAM1929 host target gene. PI15 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PI15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PI15 BINDING SITE, designated SEQ ID:18030, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65005] Another function of VGAM1929 is therefore inhibition of Protease Inhibitor 15 (PI15, Accession NM\_015886). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PI15. Phosphatidylinositol-4-phosphate

5-kinase, Type II, Beta (PIP5K2B, Accession NM\_003559) is another VGAM1929 host target gene. PIP5K2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP5K2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated SEQ ID:9610, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65006] Another function of VGAM1929 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM\_003559). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B. PLPL (Accession NM\_020181) is another VGAM1929 host target gene. PLPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLPL BINDING SITE, designated SEQ ID:21399, to the nucleotide sequence of

VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65007] Another function of VGAM1929 is therefore inhibition of PLPL (Accession NM\_020181). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLPL. Paired Mesoderm Homeobox 2b (PMX2B, Accession NM\_003924) is another VGAM1929 host target gene. PMX2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMX2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX2B BINDING SITE, designated SEQ ID:10016, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65008] Another function of VGAM1929 is therefore inhibition of Paired Mesoderm Homeobox 2b (PMX2B, Accession NM\_003924). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX2B. Protein O-fucosyltransferase 1 (POFUT1, Accession XM\_047011) is

another VGAM1929 host target gene. POFUT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POFUT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POFUT1 BINDING SITE, designated SEQ ID:34885, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65009] Another function of VGAM1929 is therefore inhibition of Protein O-fucosyltransferase 1 (POFUT1, Accession XM\_047011). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POFUT1. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 1B (dopamine and cAMP regulated phosphoprotein, DARPP-32) (PPP1R1B, Accession NM\_032192) is another VGAM1929 host target gene. PPP1R1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R1B BINDING SITE,

designated SEQ ID:25907, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65010] Another function of VGAM1929 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 1B (dopamine and cAMP regulated phosphoprotein, DARPP-32) (PPP1R1B, Accession NM\_032192). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R1B. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607) is another VGAM1929 host target gene. PPP1R3B BINDING SITE1 and PPP1R3B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPP1R3B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE1 and PPP1R3B BINDING SITE2, designated SEQ ID:23861 and SEQ ID:23862 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65011] Another function of VGAM1929 is therefore inhibition of

Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B. Preimplantation Protein 3 (PREI3, Accession XM\_038960) is another VGAM1929 host target gene. PREI3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PREI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PREI3 BINDING SITE, designated SEQ ID:32964, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65012] Another function of VGAM1929 is therefore inhibition of Preimplantation Protein 3 (PREI3, Accession XM\_038960). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PREI3. PRMT3 (Accession XM\_036392) is another VGAM1929 host target gene. PRMT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRMT3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRMT3 BINDING SITE, designated SEQ ID:32437, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65013] Another function of VGAM1929 is therefore inhibition of PRMT3 (Accession XM\_036392). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRMT3. PRMT6 (Accession NM\_018137) is another VGAM1929 host target gene. PRMT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRMT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRMT6 BINDING SITE, designated SEQ ID:19934, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65014] Another function of VGAM1929 is therefore inhibition of PRMT6 (Accession NM\_018137). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRMT6. PRO0246 (Accession NM\_014123) is another VGAM1929 host target gene. PRO0246 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0246 BINDING SITE, designated SEQ ID:15381, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65015] Another function of VGAM1929 is therefore inhibition of PRO0246 (Accession NM\_014123). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0246. PRO0767 (Accession NM\_014083) is another VGAM1929 host target gene. PRO0767 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0767, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0767 BINDING SITE, designated SEQ ID:15310, to the nucleotide

sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65016] Another function of VGAM1929 is therefore inhibition of PRO0767 (Accession NM\_014083). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0767. Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM\_003463) is another VGAM1929 host target gene. PTP4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTP4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A1 BINDING SITE, designated SEQ ID:9533, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65017] Another function of VGAM1929 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM\_003463). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A1. Rab11-FIP2 (Accession NM\_014904) is another

VGAM1929 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17101, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65018] Another function of VGAM1929 is therefore inhibition of Rab11-FIP2 (Accession NM\_014904). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. RAB3GAP (Accession XM\_040048) is another VGAM1929 host target gene. RAB3GAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3GAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3GAP BINDING SITE, designated SEQ ID:33246, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65019] Another function of VGAM1929 is therefore inhibition of RAB3GAP (Accession XM\_040048). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3GAP. RAI (Accession NM\_006663) is another VGAM1929 host target gene. RAI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13474, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65020] Another function of VGAM1929 is therefore inhibition of RAI (Accession NM\_006663). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM\_014737) is another VGAM1929 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16401, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65021] Another function of VGAM1929 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM\_014737). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM\_032918) is another VGAM1929 host target gene. RERG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RERG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERG BINDING SITE, designated SEQ ID:26740, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65022] Another function of VGAM1929 is therefore inhibition of

RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM\_032918). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERG. Rho-related BTB Domain Containing 3 (RHOBTB3, Accession NM\_014899) is another VGAM1929 host target gene. RHOBTB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RHOBTB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB3 BINDING SITE, designated SEQ ID:17079, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65023] Another function of VGAM1929 is therefore inhibition of Rho-related BTB Domain Containing 3 (RHOBTB3, Accession NM\_014899). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB3. RI58 (Accession NM\_012420) is another VGAM1929 host target gene. RI58 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

RI58, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RI58 BINDING SITE, designated SEQ ID:14796, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65024] Another function of VGAM1929 is therefore inhibition of RI58 (Accession NM\_012420). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RI58. RNAHP (Accession NM\_007372) is another VGAM1929 host target gene. RNAHP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNAHP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNAHP BINDING SITE, designated SEQ ID:14302, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65025] Another function of VGAM1929 is therefore inhibition of RNAHP (Accession NM\_007372). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RNAHP. Ring Finger Protein 2 (RNF2, Accession NM\_007212) is another VGAM1929 host target gene. RNF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF2 BINDING SITE, designated SEQ ID:14075, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65026] Another function of VGAM1929 is therefore inhibition of Ring Finger Protein 2 (RNF2, Accession NM\_007212). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF2. RNA Binding Protein S1, Serine-rich Domain (RNPS1, Accession NM\_006711) is another VGAM1929 host target gene. RNPS1 BINDING SITE1 and RNPS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RNPS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RNPS1 BINDING SITE1 and RNPS1 BINDING SITE2, designated SEQ ID:13539 and SEQ ID:27904 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65027] Another function of VGAM1929 is therefore inhibition of RNA Binding Protein S1, Serine-rich Domain (RNPS1, Accession NM\_006711). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPS1. SCAN Domain Containing 2 (SCAND2, Accession NM\_022050) is another VGAM1929 host target gene. SCAND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAND2 BINDING SITE, designated SEQ ID:22575, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65028] Another function of VGAM1929 is therefore inhibition of SCAN Domain Containing 2 (SCAND2, Accession NM\_022050). Accordingly, utilities of VGAM1929 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAND2. SEC63L (Accession NM\_007214) is another VGAM1929 host target gene. SEC63L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC63L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC63L BINDING SITE, designated SEQ ID:14080, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65029] Another function of VGAM1929 is therefore inhibition of SEC63L (Accession NM\_007214). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC63L. SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM\_030373) is another VGAM1929 host target gene. SH3BGRL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SH3BGRL BINDING SITE, designated SEQ ID:31024, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65030] Another function of VGAM1929 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM\_030373). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469) is another VGAM1929 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25530, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65031] Another function of VGAM1929 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM\_000617) is another VGAM1929 host target gene. SLC11A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC11A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:6224, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65032] Another function of VGAM1929 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM\_000617). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_018450) is another VGAM1929 host target gene.

SMARCF1 BINDING SITE1 through SMARCF1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCF1 BINDING SITE1 through SMARCF1 BINDING SITE3, designated SEQ ID:20519, SEQ ID:29162 and SEQ ID:12624 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65033] Another function of VGAM1929 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_018450). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863) is another VGAM1929 host target gene. SPTLC2 BINDING SITE1 and SPTLC2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SPTLC2, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE1 and SPTLC2 BINDING SITE2, designated SEQ ID:11279 and SEQ ID:11280 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65034] Another function of VGAM1929 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. Suppression of Tumorigenicity 13 (colon carcinoma) (Hsp70 interacting protein) (ST13, Accession NM\_003932) is another VGAM1929 host target gene. ST13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ST13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST13 BINDING SITE, designated SEQ ID:10035, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65035] Another function of VGAM1929 is therefore inhibition of Suppression of Tumorigenicity 13 (colon carcinoma) (Hsp70 interacting protein) (ST13, Accession NM\_003932). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST13. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM\_017744) is another VGAM1929 host target gene. ST7L BINDING SITE1 through ST7L BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE1 through ST7L BINDING SITE3, designated SEQ ID:19338, SEQ ID:29211 and SEQ ID:28980 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65036] Another function of VGAM1929 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM\_017744). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L. Signal Transducer

and Activator of Transcription 5A (STAT5A, Accession NM\_003152) is another VGAM1929 host target gene. STAT5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAT5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT5A BINDING SITE, designated SEQ ID:9128, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65037] Another function of VGAM1929 is therefore inhibition of Signal Transducer and Activator of Transcription 5A (STAT5A, Accession NM\_003152). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT5A. Serine/threonine Kinase 36 (fused homolog, Drosophila) (STK36, Accession XM\_050803) is another VGAM1929 host target gene. STK36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of STK36 BINDING SITE, designated SEQ ID:35691, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65038] Another function of VGAM1929 is therefore inhibition of Serine/threonine Kinase 36 (fused homolog, Drosophila) (STK36, Accession XM\_050803). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK36. STRIN (Accession NM\_016271) is another VGAM1929 host target gene. STRIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STRIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRIN BINDING SITE, designated SEQ ID:18395, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65039] Another function of VGAM1929 is therefore inhibition of STRIN (Accession NM\_016271). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRIN.

Striatin, Calmodulin Binding Protein 3 (STRN3, Accession NM\_014574) is another VGAM1929 host target gene. STRN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRN3 BINDING SITE, designated SEQ ID:15936, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65040] Another function of VGAM1929 is therefore inhibition of Striatin, Calmodulin Binding Protein 3 (STRN3, Accession NM\_014574). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRN3. Synaptophysin-like Protein (SYPL, Accession XM\_167511) is another VGAM1929 host target gene. SYPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYPL BINDING SITE, desig-

nated SEQ ID:44646, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65041] Another function of VGAM1929 is therefore inhibition of Synaptophysin-like Protein (SYPL, Accession XM\_167511). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYPL. Synaptotagmin-like 2 (SYTL2, Accession NM\_032943) is another VGAM1929 host target gene. SYTL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SYTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYTL2 BINDING SITE, designated SEQ ID:26760, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65042] Another function of VGAM1929 is therefore inhibition of Synaptotagmin-like 2 (SYTL2, Accession NM\_032943). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL2. TA-PP2C (Accession NM\_139283)

is another VGAM1929 host target gene. TA-PP2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TA-PP2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TA-PP2C BINDING SITE, designated SEQ ID:29286, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65043] Another function of VGAM1929 is therefore inhibition of TA-PP2C (Accession NM\_139283). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-PP2C. TAF5-like RNA Polymerase II, P300/CBP-associated Factor (PCAF)-associated Factor, 65kDa (TAF5L, Accession NM\_014409) is another VGAM1929 host target gene. TAF5L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF5L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF5L BINDING SITE, designated SEQ ID:15750, to the nucleotide sequence of VGAM1929 RNA,

herein designated VGAM RNA, also designated SEQ ID:4640.

[65044] Another function of VGAM1929 is therefore inhibition of TAF5-like RNA Polymerase II, P300/CBP-associated Factor (PCAF)-associated Factor, 65kDa (TAF5L, Accession NM\_014409). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF5L. TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975) is another VGAM1929 host target gene. TAF9L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF9L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18076, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65045] Another function of VGAM1929 is therefore inhibition of TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975). Accordingly, utilities of VGAM1929 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L. TBDN100 (Accession NM\_025085) is another VGAM1929 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:24695, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65046] Another function of VGAM1929 is therefore inhibition of TBDN100 (Accession NM\_025085). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. Transcription Factor-like 5 (basic helix-loop-helix) (TCFL5, Accession NM\_006602) is another VGAM1929 host target gene. TCFL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TCFL5 BINDING SITE, designated SEQ ID:13382, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65047] Another function of VGAM1929 is therefore inhibition of Transcription Factor-like 5 (basic helix-loop-helix) (TCFL5, Accession NM\_006602). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL5. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_012468) is another VGAM1929 host target gene. TCL6 BINDING SITE1 through TCL6 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 through TCL6 BINDING SITE4, designated SEQ ID:14846, SEQ ID:15770, SEQ ID:21772 and SEQ ID:21763 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65048] Another function of VGAM1929 is therefore inhibition of

T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_012468). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. TIP-1 (Accession NM\_014604) is another VGAM1929 host target gene. TIP-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIP-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP-1 BINDING SITE, designated SEQ ID:15966, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65049] Another function of VGAM1929 is therefore inhibition of TIP-1 (Accession NM\_014604). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP-1. Trinucleotide Repeat Containing 5 (TNRC5, Accession NM\_006586) is another VGAM1929 host target gene. TNRC5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TNRC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TNRC5 BINDING SITE, designated SEQ ID:13346, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65050] Another function of VGAM1929 is therefore inhibition of Trinucleotide Repeat Containing 5 (TNRC5, Accession NM\_006586). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC5. Transducer of ERBB2, 2 (TOB2, Accession XM\_170995) is another VGAM1929 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45768, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65051] Another function of VGAM1929 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM\_170995). Accordingly, utilities of VGAM1929 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with TOB2. TOLLIP (Accession NM\_019009) is another VGAM1929 host target gene. TOLLIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOLLIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOLLIP BINDING SITE, designated SEQ ID:21093, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65052] Another function of VGAM1929 is therefore inhibition of TOLLIP (Accession NM\_019009). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOLLIP. TOPK (Accession NM\_018492) is another VGAM1929 host target gene. TOPK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOPK BINDING SITE, designated SEQ

ID:20554, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65053] Another function of VGAM1929 is therefore inhibition of TOPK (Accession NM\_018492). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOPK. Testis-specific Transcript, Y-linked 9 (TTY9, Accession NM\_031927) is another VGAM1929 host target gene. TTY9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TTY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY9 BINDING SITE, designated SEQ ID:25679, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65054] Another function of VGAM1929 is therefore inhibition of Testis-specific Transcript, Y-linked 9 (TTY9, Accession NM\_031927). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY9. Ubiquitin-conju-

gating Enzyme E2G 1 (UBC7 homolog, *C. elegans*) (UBE2G1, Accession NM\_003342) is another VGAM1929 host target gene. UBE2G1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2G1 BINDING SITE, designated SEQ ID:9349, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65055] Another function of VGAM1929 is therefore inhibition of Ubiquitin-conjugating Enzyme E2G 1 (UBC7 homolog, *C. elegans*) (UBE2G1, Accession NM\_003342). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2G1. Unc-5 Homolog D (*C. elegans*) (UNC5D, Accession NM\_080872) is another VGAM1929 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of UNC5D BINDING SITE, designated SEQ ID:28116, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65056] Another function of VGAM1929 is therefore inhibition of Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM\_080872). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. Ubiquitin Specific Protease 15 (USP15, Accession NM\_006313) is another VGAM1929 host target gene. USP15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP15 BINDING SITE, designated SEQ ID:13007, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65057] Another function of VGAM1929 is therefore inhibition of Ubiquitin Specific Protease 15 (USP15, Accession NM\_006313). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with USP15. Ubiquitin Specific Protease 25 (USP25, Accession NM\_013396) is another VGAM1929 host target gene. USP25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP25 BINDING SITE, designated SEQ ID:15049, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65058] Another function of VGAM1929 is therefore inhibition of Ubiquitin Specific Protease 25 (USP25, Accession NM\_013396). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP25. Ubiquitin Specific Protease 8 (USP8, Accession NM\_005154) is another VGAM1929 host target gene. USP8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP8 BINDING SITE,

designated SEQ ID:11630, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65059] Another function of VGAM1929 is therefore inhibition of Ubiquitin Specific Protease 8 (USP8, Accession NM\_005154). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP8. VEZATIN (Accession NM\_017599) is another VGAM1929 host target gene. VEZATIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VEZATIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VEZATIN BINDING SITE, designated SEQ ID:19073, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65060] Another function of VGAM1929 is therefore inhibition of VEZATIN (Accession NM\_017599). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEZATIN. VMP1 (Accession NM\_030938) is another

VGAM1929 host target gene. VMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VMP1 BINDING SITE, designated SEQ ID:25208, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65061] Another function of VGAM1929 is therefore inhibition of VMP1 (Accession NM\_030938). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VMP1. X123 (Accession XM\_046023) is another VGAM1929 host target gene. X123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by X123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of X123 BINDING SITE, designated SEQ ID:34649, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65062] Another function of VGAM1929 is therefore inhibition of X123 (Accession XM\_046023). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with X123. Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106) is another VGAM1929 host target gene. YAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YAP1 BINDING SITE, designated SEQ ID:12753, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65063] Another function of VGAM1929 is therefore inhibition of Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Theta Polypeptide (YWHAQ, Accession NM\_006826) is another VGAM1929 host target gene. YWHAQ BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by YWHAQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAQ BINDING SITE, designated SEQ ID:13707, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65064] Another function of VGAM1929 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Theta Polypeptide (YWHAQ, Accession NM\_006826). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAQ. Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM\_053023) is another VGAM1929 host target gene. ZFP91 BINDING SITE1 through ZFP91 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZFP91, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP91 BINDING SITE1 through ZFP91 BINDING SITE3, designated SEQ

ID:27575, SEQ ID:27573 and SEQ ID:27574 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65065] Another function of VGAM1929 is therefore inhibition of Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM\_053023). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91. Zinc Finger Protein 323 (ZNF323, Accession NM\_030899) is another VGAM1929 host target gene. ZNF323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING SITE, designated SEQ ID:25169, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65066] Another function of VGAM1929 is therefore inhibition of Zinc Finger Protein 323 (ZNF323, Accession NM\_030899). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323. ZNF361 (Accession

NM\_018555) is another VGAM1929 host target gene. ZNF361 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF361 BINDING SITE, designated SEQ ID:20636, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65067] Another function of VGAM1929 is therefore inhibition of ZNF361 (Accession NM\_018555). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF361. Zinc Finger Protein 363 (ZNF363, Accession XM\_055989) is another VGAM1929 host target gene. ZNF363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF363 BINDING SITE, designated SEQ ID:36358, to the nucleotide sequence of VGAM1929 RNA,

herein designated VGAM RNA, also designated SEQ ID:4640.

[65068] Another function of VGAM1929 is therefore inhibition of Zinc Finger Protein 363 (ZNF363, Accession XM\_055989). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF363. LOC112885 (Accession NM\_138415) is another VGAM1929 host target gene. LOC112885 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112885, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112885 BINDING SITE, designated SEQ ID:28786, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65069] Another function of VGAM1929 is therefore inhibition of LOC112885 (Accession NM\_138415). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112885. LOC115297 (Accession XM\_053313) is another VGAM1929 host target gene. LOC115297 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115297 BINDING SITE, designated SEQ ID:36070, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65070] Another function of VGAM1929 is therefore inhibition of LOC115297 (Accession XM\_053313). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115297. LOC120856 (Accession XM\_058509) is another VGAM1929 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36638, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65071] Another function of VGAM1929 is therefore inhibition of

LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC121219 (Accession XM\_058544) is another VGAM1929 host target gene. LOC121219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC121219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121219 BINDING SITE, designated SEQ ID:36650, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65072] Another function of VGAM1929 is therefore inhibition of LOC121219 (Accession XM\_058544). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121219. LOC121838 (Accession XM\_071772) is another VGAM1929 host target gene. LOC121838 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC121838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC121838 BINDING SITE, designated SEQ ID:37420, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65073] Another function of VGAM1929 is therefore inhibition of LOC121838 (Accession XM\_071772). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121838. LOC123036 (Accession XM\_058676) is another VGAM1929 host target gene. LOC123036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC123036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123036 BINDING SITE, designated SEQ ID:36717, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65074] Another function of VGAM1929 is therefore inhibition of LOC123036 (Accession XM\_058676). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123036. LOC126526 (Accession XM\_059053) is an-

other VGAM1929 host target gene. LOC126526 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126526, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126526 BINDING SITE, designated SEQ ID:36847, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65075] Another function of VGAM1929 is therefore inhibition of LOC126526 (Accession XM\_059053). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126526. LOC126528 (Accession XM\_059052) is another VGAM1929 host target gene. LOC126528 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126528 BINDING SITE, designated SEQ ID:36844, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65076] Another function of VGAM1929 is therefore inhibition of LOC126528 (Accession XM\_059052). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126528. LOC131000 (Accession XM\_067145) is another VGAM1929 host target gene. LOC131000 BINDING SITE1 and LOC131000 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC131000, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131000 BINDING SITE1 and LOC131000 BINDING SITE2, designated SEQ ID:37352 and SEQ ID:37351 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65077] Another function of VGAM1929 is therefore inhibition of LOC131000 (Accession XM\_067145). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131000. LOC132235 (Accession XM\_072302) is another VGAM1929 host target gene. LOC132235 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:37482, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65078] Another function of VGAM1929 is therefore inhibition of LOC132235 (Accession XM\_072302). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235. LOC135398 (Accession XM\_069333) is another VGAM1929 host target gene. LOC135398 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135398 BINDING SITE, designated SEQ ID:37388, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65079] Another function of VGAM1929 is therefore inhibition of LOC135398 (Accession XM\_069333). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135398. LOC139673 (Accession XM\_071645) is another VGAM1929 host target gene. LOC139673 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139673 BINDING SITE, designated SEQ ID:37404, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65080] Another function of VGAM1929 is therefore inhibition of LOC139673 (Accession XM\_071645). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139673. LOC143310 (Accession XM\_084485) is another VGAM1929 host target gene. LOC143310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC143310 BINDING SITE, designated SEQ ID:37607, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65081] Another function of VGAM1929 is therefore inhibition of LOC143310 (Accession XM\_084485). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310. LOC143888 (Accession XM\_084669) is another VGAM1929 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37669, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65082] Another function of VGAM1929 is therefore inhibition of LOC143888 (Accession XM\_084669). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC145786 (Accession XM\_096860) is another VGAM1929 host target gene. LOC145786 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145786 BINDING SITE, designated SEQ ID:40593, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65083] Another function of VGAM1929 is therefore inhibition of LOC145786 (Accession XM\_096860). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145786. LOC145845 (Accession XM\_096884) is another VGAM1929 host target gene. LOC145845 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145845 BINDING SITE, designated SEQ ID:40616, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65084] Another function of VGAM1929 is therefore inhibition of

LOC145845 (Accession XM\_096884). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145845. LOC146138 (Accession XM\_096938) is another VGAM1929 host target gene. LOC146138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146138 BINDING SITE, designated SEQ ID:40655, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65085] Another function of VGAM1929 is therefore inhibition of LOC146138 (Accession XM\_096938). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146138. LOC146515 (Accession XM\_085493) is another VGAM1929 host target gene. LOC146515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146515 BINDING SITE, designated SEQ ID:38196, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65086] Another function of VGAM1929 is therefore inhibition of LOC146515 (Accession XM\_085493). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146515. LOC146713 (Accession XM\_097071) is another VGAM1929 host target gene. LOC146713 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146713 BINDING SITE, designated SEQ ID:40718, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65087] Another function of VGAM1929 is therefore inhibition of LOC146713 (Accession XM\_097071). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146713. LOC147136 (Accession XM\_085716) is an-

other VGAM1929 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38304, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65088] Another function of VGAM1929 is therefore inhibition of LOC147136 (Accession XM\_085716). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC147353 (Accession XM\_097227) is another VGAM1929 host target gene. LOC147353 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147353 BINDING SITE, designated SEQ ID:40835, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65089] Another function of VGAM1929 is therefore inhibition of LOC147353 (Accession XM\_097227). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147353. LOC147515 (Accession XM\_097243) is another VGAM1929 host target gene. LOC147515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147515 BINDING SITE, designated SEQ ID:40843, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65090] Another function of VGAM1929 is therefore inhibition of LOC147515 (Accession XM\_097243). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147515. LOC147639 (Accession XM\_085822) is another VGAM1929 host target gene. LOC147639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147639, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147639 BINDING SITE, designated SEQ ID:38345, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65091] Another function of VGAM1929 is therefore inhibition of LOC147639 (Accession XM\_085822). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147639. LOC148809 (Accession XM\_086325) is another VGAM1929 host target gene. LOC148809 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148809, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148809 BINDING SITE, designated SEQ ID:38595, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65092] Another function of VGAM1929 is therefore inhibition of LOC148809 (Accession XM\_086325). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148809. LOC148936 (Accession XM\_097556) is another VGAM1929 host target gene. LOC148936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148936 BINDING SITE, designated SEQ ID:40933, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65093] Another function of VGAM1929 is therefore inhibition of LOC148936 (Accession XM\_097556). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148936. LOC148938 (Accession XM\_097555) is another VGAM1929 host target gene. LOC148938 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148938 BINDING SITE, designated SEQ ID:40926, to the nucleotide sequence of VGAM1929 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4640.

[65094] Another function of VGAM1929 is therefore inhibition of LOC148938 (Accession XM\_097555). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148938. LOC149073 (Accession XM\_097577) is another VGAM1929 host target gene. LOC149073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149073 BINDING SITE, designated SEQ ID:40944, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65095] Another function of VGAM1929 is therefore inhibition of LOC149073 (Accession XM\_097577). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149073. LOC149113 (Accession XM\_086425) is another VGAM1929 host target gene. LOC149113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149113, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149113 BINDING SITE, designated SEQ ID:38641, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65096] Another function of VGAM1929 is therefore inhibition of LOC149113 (Accession XM\_086425). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149113. LOC149267 (Accession NM\_138480) is another VGAM1929 host target gene. LOC149267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149267 BINDING SITE, designated SEQ ID:28832, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65097] Another function of VGAM1929 is therefore inhibition of LOC149267 (Accession NM\_138480). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149267. LOC149322 (Accession XM\_004762) is another VGAM1929 host target gene. LOC149322 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149322 BINDING SITE, designated SEQ ID:29946, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65098] Another function of VGAM1929 is therefore inhibition of LOC149322 (Accession XM\_004762). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149322. LOC149373 (Accession XM\_086507) is another VGAM1929 host target gene. LOC149373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149373 BINDING SITE, designated SEQ ID:38722, to

the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65099] Another function of VGAM1929 is therefore inhibition of LOC149373 (Accession XM\_086507). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149373. LOC149670 (Accession XM\_086647) is another VGAM1929 host target gene. LOC149670 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149670, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149670 BINDING SITE, designated SEQ ID:38806, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65100] Another function of VGAM1929 is therefore inhibition of LOC149670 (Accession XM\_086647). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149670. LOC149692 (Accession XM\_097706) is another VGAM1929 host target gene. LOC149692 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC149692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149692 BINDING SITE, designated SEQ ID:41040, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65101] Another function of VGAM1929 is therefore inhibition of LOC149692 (Accession XM\_097706). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149692. LOC149995 (Accession XM\_097798) is another VGAM1929 host target gene. LOC149995 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149995, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149995 BINDING SITE, designated SEQ ID:41128, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65102] Another function of VGAM1929 is therefore inhibition of LOC149995 (Accession XM\_097798). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149995. LOC150142 (Accession XM\_086791) is another VGAM1929 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38852, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65103] Another function of VGAM1929 is therefore inhibition of LOC150142 (Accession XM\_086791). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC150271 (Accession XM\_097859) is another VGAM1929 host target gene. LOC150271 BINDING SITE1 and LOC150271 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC150271, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC150271 BINDING SITE1 and LOC150271 BINDING SITE2, designated SEQ ID:41168 and SEQ ID:41177 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65104] Another function of VGAM1929 is therefore inhibition of LOC150271 (Accession XM\_097859). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC150848 (Accession XM\_097959) is another VGAM1929 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41263, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65105] Another function of VGAM1929 is therefore inhibition of LOC150848 (Accession XM\_097959). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150848. LOC151277 (Accession XM\_087155) is another VGAM1929 host target gene. LOC151277 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151277 BINDING SITE, designated SEQ ID:39095, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65106] Another function of VGAM1929 is therefore inhibition of LOC151277 (Accession XM\_087155). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151277. LOC151361 (Accession XM\_098048) is another VGAM1929 host target gene. LOC151361 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151361 BINDING SITE, designated SEQ ID:41329, to the nucleotide sequence of VGAM1929 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4640.

[65107] Another function of VGAM1929 is therefore inhibition of LOC151361 (Accession XM\_098048). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151361. LOC151556 (Accession XM\_087239) is another VGAM1929 host target gene. LOC151556 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151556 BINDING SITE, designated SEQ ID:39132, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65108] Another function of VGAM1929 is therefore inhibition of LOC151556 (Accession XM\_087239). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151556. LOC151701 (Accession XM\_098109) is another VGAM1929 host target gene. LOC151701 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151701, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151701 BINDING SITE, designated SEQ ID:41387, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65109] Another function of VGAM1929 is therefore inhibition of LOC151701 (Accession XM\_098109). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151701. LOC151827 (Accession XM\_087317) is another VGAM1929 host target gene. LOC151827 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151827 BINDING SITE, designated SEQ ID:39169, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65110] Another function of VGAM1929 is therefore inhibition of LOC151827 (Accession XM\_087317). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151827. LOC152559 (Accession XM\_087487) is another VGAM1929 host target gene. LOC152559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152559 BINDING SITE, designated SEQ ID:39284, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65111] Another function of VGAM1929 is therefore inhibition of LOC152559 (Accession XM\_087487). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152559. LOC152804 (Accession XM\_098266) is another VGAM1929 host target gene. LOC152804 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152804 BINDING SITE, designated SEQ ID:41555, to

the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65112] Another function of VGAM1929 is therefore inhibition of LOC152804 (Accession XM\_098266). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152804. LOC153027 (Accession XM\_041221) is another VGAM1929 host target gene. LOC153027 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153027 BINDING SITE, designated SEQ ID:33491, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65113] Another function of VGAM1929 is therefore inhibition of LOC153027 (Accession XM\_041221). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153027. LOC153196 (Accession XM\_098323) is another VGAM1929 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41596, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65114] Another function of VGAM1929 is therefore inhibition of LOC153196 (Accession XM\_098323). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. LOC153232 (Accession XM\_098331) is another VGAM1929 host target gene. LOC153232 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153232 BINDING SITE, designated SEQ ID:41598, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65115] Another function of VGAM1929 is therefore inhibition of LOC153232 (Accession XM\_098331). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153232. LOC153346 (Accession XM\_098364) is another VGAM1929 host target gene. LOC153346 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153346 BINDING SITE, designated SEQ ID:41619, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65116] Another function of VGAM1929 is therefore inhibition of LOC153346 (Accession XM\_098364). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153346. LOC154043 (Accession XM\_087831) is another VGAM1929 host target gene. LOC154043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC154043 BINDING SITE, designated SEQ ID:39461, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65117] Another function of VGAM1929 is therefore inhibition of LOC154043 (Accession XM\_087831). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154043. LOC154403 (Accession XM\_087919) is another VGAM1929 host target gene. LOC154403 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154403, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154403 BINDING SITE, designated SEQ ID:39469, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65118] Another function of VGAM1929 is therefore inhibition of LOC154403 (Accession XM\_087919). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154403. LOC154992 (Accession XM\_088106) is another VGAM1929 host target gene. LOC154992 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154992 BINDING SITE, designated SEQ ID:39519, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65119] Another function of VGAM1929 is therefore inhibition of LOC154992 (Accession XM\_088106). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154992. LOC155081 (Accession XM\_088145) is another VGAM1929 host target gene. LOC155081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155081 BINDING SITE, designated SEQ ID:39545, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65120] Another function of VGAM1929 is therefore inhibition of

LOC155081 (Accession XM\_088145). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155081. LOC157503 (Accession XM\_098767) is another VGAM1929 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:41813, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65121] Another function of VGAM1929 is therefore inhibition of LOC157503 (Accession XM\_098767). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157503. LOC157653 (Accession XM\_088353) is another VGAM1929 host target gene. LOC157653 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC157653 BINDING SITE, designated SEQ ID:39635, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65122] Another function of VGAM1929 is therefore inhibition of LOC157653 (Accession XM\_088353). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157653. LOC158014 (Accession XM\_088442) is another VGAM1929 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39692, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65123] Another function of VGAM1929 is therefore inhibition of LOC158014 (Accession XM\_088442). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC158055 (Accession XM\_088453) is an-

other VGAM1929 host target gene. LOC158055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158055 BINDING SITE, designated SEQ ID:39704, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65124] Another function of VGAM1929 is therefore inhibition of LOC158055 (Accession XM\_088453). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158055. LOC158382 (Accession XM\_098931) is another VGAM1929 host target gene. LOC158382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158382 BINDING SITE, designated SEQ ID:41966, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65125] Another function of VGAM1929 is therefore inhibition of LOC158382 (Accession XM\_098931). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158382. LOC158549 (Accession XM\_098963) is another VGAM1929 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42006, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65126] Another function of VGAM1929 is therefore inhibition of LOC158549 (Accession XM\_098963). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC196027 (Accession XM\_113633) is another VGAM1929 host target gene. LOC196027 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196027, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196027 BINDING SITE, designated SEQ ID:42308, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65127] Another function of VGAM1929 is therefore inhibition of LOC196027 (Accession XM\_113633). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196027. LOC196446 (Accession XM\_113722) is another VGAM1929 host target gene. LOC196446 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196446 BINDING SITE, designated SEQ ID:42373, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65128] Another function of VGAM1929 is therefore inhibition of LOC196446 (Accession XM\_113722). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196446. LOC196761 (Accession XM\_116865) is another VGAM1929 host target gene. LOC196761 BINDING SITE1 and LOC196761 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC196761, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196761 BINDING SITE1 and LOC196761 BINDING SITE2, designated SEQ ID:43128 and SEQ ID:43130 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65129] Another function of VGAM1929 is therefore inhibition of LOC196761 (Accession XM\_116865). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196761. LOC197131 (Accession XM\_113823) is another VGAM1929 host target gene. LOC197131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC197131 BINDING SITE, designated SEQ ID:42446, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65130] Another function of VGAM1929 is therefore inhibition of LOC197131 (Accession XM\_113823). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197131. LOC197319 (Accession XM\_113862) is another VGAM1929 host target gene. LOC197319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197319 BINDING SITE, designated SEQ ID:42478, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65131] Another function of VGAM1929 is therefore inhibition of LOC197319 (Accession XM\_113862). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197319. LOC199699 (Accession XM\_113990) is another VGAM1929 host target gene. LOC199699 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199699 BINDING SITE, designated SEQ ID:42595, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65132] Another function of VGAM1929 is therefore inhibition of LOC199699 (Accession XM\_113990). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199699. LOC199775 (Accession XM\_114016) is another VGAM1929 host target gene. LOC199775 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199775 BINDING SITE, designated SEQ ID:42616, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65133] Another function of VGAM1929 is therefore inhibition of

LOC199775 (Accession XM\_114016). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199775. LOC200014 (Accession XM\_114087) is another VGAM1929 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42697, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65134] Another function of VGAM1929 is therefore inhibition of LOC200014 (Accession XM\_114087). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. LOC200107 (Accession XM\_114121) is another VGAM1929 host target gene. LOC200107 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC200107 BINDING SITE, designated SEQ ID:42707, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65135] Another function of VGAM1929 is therefore inhibition of LOC200107 (Accession XM\_114121). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200107. LOC200138 (Accession XM\_117194) is another VGAM1929 host target gene. LOC200138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200138 BINDING SITE, designated SEQ ID:43281, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65136] Another function of VGAM1929 is therefore inhibition of LOC200138 (Accession XM\_117194). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200138. LOC200558 (Accession XM\_114258) is an-

other VGAM1929 host target gene. LOC200558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200558 BINDING SITE, designated SEQ ID:42820, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65137] Another function of VGAM1929 is therefore inhibition of LOC200558 (Accession XM\_114258). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200558. LOC200563 (Accession XM\_117251) is another VGAM1929 host target gene. LOC200563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200563 BINDING SITE, designated SEQ ID:43319, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65138] Another function of VGAM1929 is therefore inhibition of LOC200563 (Accession XM\_117251). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200563. LOC200609 (Accession XM\_117256) is another VGAM1929 host target gene. LOC200609 BINDING SITE1 and LOC200609 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC200609, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE1 and LOC200609 BINDING SITE2, designated SEQ ID:43329 and SEQ ID:43336 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65139] Another function of VGAM1929 is therefore inhibition of LOC200609 (Accession XM\_117256). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC201182 (Accession XM\_117055) is another VGAM1929 host target gene. LOC201182 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC201182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201182 BINDING SITE, designated SEQ ID:43212, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65140] Another function of VGAM1929 is therefore inhibition of LOC201182 (Accession XM\_117055). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201182. LOC201868 (Accession XM\_114393) is another VGAM1929 host target gene. LOC201868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201868 BINDING SITE, designated SEQ ID:42922, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65141] Another function of VGAM1929 is therefore inhibition of LOC201868 (Accession XM\_114393). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201868. LOC201965 (Accession XM\_114412) is another VGAM1929 host target gene. LOC201965 BINDING SITE1 and LOC201965 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC201965, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201965 BINDING SITE1 and LOC201965 BINDING SITE2, designated SEQ ID:42932 and SEQ ID:42933 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65142] Another function of VGAM1929 is therefore inhibition of LOC201965 (Accession XM\_114412). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201965. LOC202802 (Accession XM\_114560) is another VGAM1929 host target gene. LOC202802 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202802, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202802 BINDING SITE, designated SEQ ID:42990, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65143] Another function of VGAM1929 is therefore inhibition of LOC202802 (Accession XM\_114560). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202802. LOC202934 (Accession XM\_117486) is another VGAM1929 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43457, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65144] Another function of VGAM1929 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC202934. LOC203248 (Accession XM\_114659) is another VGAM1929 host target gene. LOC203248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203248 BINDING SITE, designated SEQ ID:43021, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65145] Another function of VGAM1929 is therefore inhibition of LOC203248 (Accession XM\_114659). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203248. LOC203536 (Accession XM\_114716) is another VGAM1929 host target gene. LOC203536 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203536 BINDING SITE, designated SEQ ID:43057, to the nucleotide sequence of VGAM1929 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4640.

[65146] Another function of VGAM1929 is therefore inhibition of LOC203536 (Accession XM\_114716). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203536. LOC205327 (Accession XM\_115788) is another VGAM1929 host target gene. LOC205327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC205327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205327 BINDING SITE, designated SEQ ID:43107, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65147] Another function of VGAM1929 is therefore inhibition of LOC205327 (Accession XM\_115788). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205327. LOC219654 (Accession XM\_166095) is another VGAM1929 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219654, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:43880, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65148] Another function of VGAM1929 is therefore inhibition of LOC219654 (Accession XM\_166095). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC219942 (Accession XM\_167790) is another VGAM1929 host target gene. LOC219942 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219942 BINDING SITE, designated SEQ ID:44828, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65149] Another function of VGAM1929 is therefore inhibition of LOC219942 (Accession XM\_167790). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219942. LOC220469 (Accession XM\_084334) is another VGAM1929 host target gene. LOC220469 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220469 BINDING SITE, designated SEQ ID:37557, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65150] Another function of VGAM1929 is therefore inhibition of LOC220469 (Accession XM\_084334). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220469. LOC220635 (Accession XM\_165433) is another VGAM1929 host target gene. LOC220635 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220635 BINDING SITE, designated SEQ ID:43639, to

the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65151] Another function of VGAM1929 is therefore inhibition of LOC220635 (Accession XM\_165433). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220635. LOC220729 (Accession XM\_049575) is another VGAM1929 host target gene. LOC220729 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220729 BINDING SITE, designated SEQ ID:35447, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65152] Another function of VGAM1929 is therefore inhibition of LOC220729 (Accession XM\_049575). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220729. LOC220963 (Accession XM\_166145) is another VGAM1929 host target gene. LOC220963 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220963 BINDING SITE, designated SEQ ID:43956, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65153] Another function of VGAM1929 is therefore inhibition of LOC220963 (Accession XM\_166145). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220963. LOC220988 (Accession XM\_165561) is another VGAM1929 host target gene. LOC220988 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220988 BINDING SITE, designated SEQ ID:43686, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65154] Another function of VGAM1929 is therefore inhibition of LOC220988 (Accession XM\_165561). Accordingly, utilities

of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220988. LOC221178 (Accession XM\_167936) is another VGAM1929 host target gene. LOC221178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221178 BINDING SITE, designated SEQ ID:44931, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65155] Another function of VGAM1929 is therefore inhibition of LOC221178 (Accession XM\_167936). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221178. LOC221312 (Accession XM\_166314) is another VGAM1929 host target gene. LOC221312 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221312 BINDING SITE, designated SEQ ID:44139, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65156] Another function of VGAM1929 is therefore inhibition of LOC221312 (Accession XM\_166314). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221312. LOC221814 (Accession XM\_168226) is another VGAM1929 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45091, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65157] Another function of VGAM1929 is therefore inhibition of LOC221814 (Accession XM\_168226). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. LOC221815 (Accession XM\_168225) is another VGAM1929 host target gene. LOC221815 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221815 BINDING SITE, designated SEQ ID:45087, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65158] Another function of VGAM1929 is therefore inhibition of LOC221815 (Accession XM\_168225). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221815. LOC222070 (Accession XM\_168433) is another VGAM1929 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45182, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65159] Another function of VGAM1929 is therefore inhibition of

LOC222070 (Accession XM\_168433). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070. LOC222159 (Accession XM\_168421) is another VGAM1929 host target gene. LOC222159 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222159 BINDING SITE, designated SEQ ID:45148, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65160] Another function of VGAM1929 is therefore inhibition of LOC222159 (Accession XM\_168421). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222159. LOC222161 (Accession XM\_166596) is another VGAM1929 host target gene. LOC222161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC222161 BINDING SITE, designated SEQ ID:44582, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65161] Another function of VGAM1929 is therefore inhibition of LOC222161 (Accession XM\_166596). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222161. LOC222178 (Accession XM\_168453) is another VGAM1929 host target gene. LOC222178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222178 BINDING SITE, designated SEQ ID:45189, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65162] Another function of VGAM1929 is therefore inhibition of LOC222178 (Accession XM\_168453). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222178. LOC222228 (Accession XM\_168627) is an-

other VGAM1929 host target gene. LOC222228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222228 BINDING SITE, designated SEQ ID:45276, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65163] Another function of VGAM1929 is therefore inhibition of LOC222228 (Accession XM\_168627). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222228. LOC222233 (Accession XM\_168560) is another VGAM1929 host target gene. LOC222233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222233 BINDING SITE, designated SEQ ID:45245, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65164] Another function of VGAM1929 is therefore inhibition of LOC222233 (Accession XM\_168560). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222233. LOC222237 (Accession XM\_168592) is another VGAM1929 host target gene. LOC222237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222237 BINDING SITE, designated SEQ ID:45271, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65165] Another function of VGAM1929 is therefore inhibition of LOC222237 (Accession XM\_168592). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222237. LOC222256 (Accession XM\_168571) is another VGAM1929 host target gene. LOC222256 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222256, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222256 BINDING SITE, designated SEQ ID:45249, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65166] Another function of VGAM1929 is therefore inhibition of LOC222256 (Accession XM\_168571). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222256. LOC253776 (Accession XM\_173240) is another VGAM1929 host target gene. LOC253776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253776 BINDING SITE, designated SEQ ID:46527, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65167] Another function of VGAM1929 is therefore inhibition of LOC253776 (Accession XM\_173240). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253776. LOC253786 (Accession XM\_173109) is another VGAM1929 host target gene. LOC253786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253786 BINDING SITE, designated SEQ ID:46364, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65168] Another function of VGAM1929 is therefore inhibition of LOC253786 (Accession XM\_173109). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253786. LOC253890 (Accession XM\_171016) is another VGAM1929 host target gene. LOC253890 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253890 BINDING SITE, designated SEQ ID:45785, to the nucleotide sequence of VGAM1929 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4640.

[65169] Another function of VGAM1929 is therefore inhibition of LOC253890 (Accession XM\_171016). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253890. LOC254532 (Accession XM\_172961) is another VGAM1929 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46215, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65170] Another function of VGAM1929 is therefore inhibition of LOC254532 (Accession XM\_172961). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC255045 (Accession XM\_171243) is another VGAM1929 host target gene. LOC255045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255045, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255045 BINDING SITE, designated SEQ ID:46036, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65171] Another function of VGAM1929 is therefore inhibition of LOC255045 (Accession XM\_171243). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255045. LOC255465 (Accession XM\_173206) is another VGAM1929 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46450, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65172] Another function of VGAM1929 is therefore inhibition of LOC255465 (Accession XM\_173206). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC255465. LOC255515 (Accession XM\_171185) is another VGAM1929 host target gene. LOC255515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255515 BINDING SITE, designated SEQ ID:45962, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65173] Another function of VGAM1929 is therefore inhibition of LOC255515 (Accession XM\_171185). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255515. LOC255520 (Accession XM\_171073) is another VGAM1929 host target gene. LOC255520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255520 BINDING SITE, designated SEQ ID:45882, to

the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65174] Another function of VGAM1929 is therefore inhibition of LOC255520 (Accession XM\_171073). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255520. LOC256867 (Accession XM\_170694) is another VGAM1929 host target gene. LOC256867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256867 BINDING SITE, designated SEQ ID:45478, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65175] Another function of VGAM1929 is therefore inhibition of LOC256867 (Accession XM\_170694). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256867. LOC257017 (Accession XM\_173227) is another VGAM1929 host target gene. LOC257017 BINDING SITE1 and LOC257017 BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by LOC257017, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE1 and LOC257017 BINDING SITE2, designated SEQ ID:46493 and SEQ ID:46499 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65176] Another function of VGAM1929 is therefore inhibition of LOC257017 (Accession XM\_173227). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. LOC51631 (Accession XM\_042779) is another VGAM1929 host target gene. LOC51631 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51631 BINDING SITE, designated SEQ ID:33769, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65177] Another function of VGAM1929 is therefore inhibition of LOC51631 (Accession XM\_042779). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51631. LOC57149 (Accession NM\_020424) is another VGAM1929 host target gene. LOC57149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57149 BINDING SITE, designated SEQ ID:21682, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65178] Another function of VGAM1929 is therefore inhibition of LOC57149 (Accession NM\_020424). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57149. LOC84549 (Accession NM\_032509) is another VGAM1929 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26263, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65179] Another function of VGAM1929 is therefore inhibition of LOC84549 (Accession NM\_032509). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. LOC90309 (Accession XM\_030830) is another VGAM1929 host target gene. LOC90309 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90309 BINDING SITE, designated SEQ ID:31152, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65180] Another function of VGAM1929 is therefore inhibition of LOC90309 (Accession XM\_030830). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90309. LOC90624 (Accession XM\_033003) is another VGAM1929 host target gene. LOC90624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90624 BINDING SITE, designated SEQ ID:31817, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65181] Another function of VGAM1929 is therefore inhibition of LOC90624 (Accession XM\_033003). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90624. LOC91012 (Accession XM\_035503) is another VGAM1929 host target gene. LOC91012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91012 BINDING SITE, designated SEQ ID:32282, to the nucleotide sequence of VGAM1929 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4640.

[65182] Another function of VGAM1929 is therefore inhibition of LOC91012 (Accession XM\_035503). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91012. LOC91250 (Accession XM\_037135) is another VGAM1929 host target gene. LOC91250 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91250 BINDING SITE, designated SEQ ID:32546, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65183] Another function of VGAM1929 is therefore inhibition of LOC91250 (Accession XM\_037135). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91250. LOC91300 (Accession NM\_138774) is another VGAM1929 host target gene. LOC91300 BINDING SITE1 and LOC91300 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

LOC91300, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91300 BINDING SITE1 and LOC91300 BINDING SITE2, designated SEQ ID:29007 and SEQ ID:45388 respectively, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65184] Another function of VGAM1929 is therefore inhibition of LOC91300 (Accession NM\_138774). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91300. LOC92231 (Accession XM\_043734) is another VGAM1929 host target gene. LOC92231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92231 BINDING SITE, designated SEQ ID:34011, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65185] Another function of VGAM1929 is therefore inhibition of

LOC92231 (Accession XM\_043734). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92231. LOC92597 (Accession XM\_046066) is another VGAM1929 host target gene. LOC92597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92597 BINDING SITE, designated SEQ ID:34674, to the nucleotide sequence of VGAM1929 RNA, herein designated VGAM RNA, also designated SEQ ID:4640.

[65186] Another function of VGAM1929 is therefore inhibition of LOC92597 (Accession XM\_046066). Accordingly, utilities of VGAM1929 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1930 (VGAM1930) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[65187] VGAM1930 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1930 was detected is described hereinabove with reference to Figs. 1–8.

[65188] VGAM1930 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM1930 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65189] VGAM1930 gene encodes a VGAM1930 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1930 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1930 precursor RNA is designated SEQ ID:1916, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1916 is located at position 150946 relative to the genome of Human Herpesvirus 4.

[65190] VGAM1930 precursor RNA folds onto itself, forming VGAM1930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65191] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1930 folded precursor RNA into VGAM1930 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1930 RNA is designated SEQ ID:4641, and is provided hereinbelow with reference to the sequence listing part.

[65192] VGAM1930 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1930 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[65193] VGAM1930 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1930 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1930 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[65194] The complementary binding of VGAM1930 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1930 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1930 host target RNA into VGAM1930 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65195] It is appreciated that VGAM1930 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1930 host target genes. The mRNA of each one of this plurality of VGAM1930 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1930 RNA, herein designated VGAM RNA, and which when bound by VGAM1930 RNA causes inhibition of translation of respective one or more VGAM1930 host target proteins.

[65196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1930 gene, herein designated VGAM GENE, on one

or more VGAM1930 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65197] It is yet further appreciated that a function of VGAM1930 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1930 correlate with, and may be deduced from, the identity of the host target genes which VGAM1930 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65198] Nucleotide sequences of the VGAM1930 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1930 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1930 are further described hereinbelow with reference to Table 1.

[65199] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1930 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1930 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65200] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1930 gene, herein designated VGAM is inhibition of expression of VGAM1930 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1930 correlate with, and may be deduced from, the identity of the target genes which VGAM1930 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65201] Chromosome 1 Open Reading Frame 34 (C1orf34, Acces-

sion XM\_027172) is a VGAM1930 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30435, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65202] A function of VGAM1930 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. FLJ14106 (Accession NM\_025067) is another VGAM1930 host target gene. FLJ14106 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14106 BINDING SITE, designated SEQ ID:24666, to the nucleotide sequence of VGAM1930

RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65203] Another function of VGAM1930 is therefore inhibition of FLJ14106 (Accession NM\_025067). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14106. GENX-3414 (Accession NM\_003943) is another VGAM1930 host target gene. GENX-3414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GENX-3414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GENX-3414 BINDING SITE, designated SEQ ID:10061, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65204] Another function of VGAM1930 is therefore inhibition of GENX-3414 (Accession NM\_003943). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GENX-3414. Smith-Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM\_144774) is another VGAM1930 host target gene. SMCR5 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCR5 BINDING SITE, designated SEQ ID:29566, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65205] Another function of VGAM1930 is therefore inhibition of Smith-Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM\_144774). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR5. Syntaphilin (SNPH, Accession NM\_014723) is another VGAM1930 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16288, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65206] Another function of VGAM1930 is therefore inhibition of Syntaphilin (SNPH, Accession NM\_014723). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. LOC145845 (Accession XM\_096884) is another VGAM1930 host target gene. LOC145845 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145845 BINDING SITE, designated SEQ ID:40618, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65207] Another function of VGAM1930 is therefore inhibition of LOC145845 (Accession XM\_096884). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145845. LOC146229 (Accession XM\_085387) is another VGAM1930 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38117, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65208] Another function of VGAM1930 is therefore inhibition of LOC146229 (Accession XM\_085387). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC148534 (Accession XM\_086222) is another VGAM1930 host target gene. LOC148534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148534 BINDING SITE, designated SEQ ID:38550, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65209] Another function of VGAM1930 is therefore inhibition of LOC148534 (Accession XM\_086222). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148534. LOC151201 (Accession XM\_098021) is another VGAM1930 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41326, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65210] Another function of VGAM1930 is therefore inhibition of LOC151201 (Accession XM\_098021). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC152991 (Accession XM\_098295) is another VGAM1930 host target gene. LOC152991 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152991 BINDING SITE, designated SEQ ID:41566, to the nucleotide sequence of VGAM1930 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4641.

[65211] Another function of VGAM1930 is therefore inhibition of LOC152991 (Accession XM\_098295). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152991. LOC57406 (Accession NM\_020676) is another VGAM1930 host target gene. LOC57406 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57406, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57406 BINDING SITE, designated SEQ ID:21839, to the nucleotide sequence of VGAM1930 RNA, herein designated VGAM RNA, also designated SEQ ID:4641.

[65212] Another function of VGAM1930 is therefore inhibition of LOC57406 (Accession NM\_020676). Accordingly, utilities of VGAM1930 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57406. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1931 (VGAM1931) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65213] VGAM1931 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1931 was detected is described hereinabove with reference to Figs. 1–8.

[65214] VGAM1931 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM1931 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65215] VGAM1931 gene encodes a VGAM1931 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1931 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1931 precursor RNA is designated SEQ ID:1917, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1917 is located at position 151629 relative to the genome of Human Herpesvirus 4.

[65216] VGAM1931 precursor RNA folds onto itself, forming

VGAM1931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65217] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1931 folded precursor RNA into VGAM1931 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1931 RNA is designated SEQ ID:4642, and is provided hereinbelow with reference to the sequence listing part.

[65218] VGAM1931 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1931 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65219] VGAM1931 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1931 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1931 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65220] The complementary binding of VGAM1931 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1931 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1931 host target RNA into VGAM1931 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65221] It is appreciated that VGAM1931 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1931 host target genes. The mRNA of each one of this plurality of VGAM1931 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1931 RNA, herein designated VGAM RNA, and which when bound by VGAM1931 RNA causes inhibition of translation of respective one or more VGAM1931 host target proteins.

[65222] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1931 gene, herein designated VGAM GENE, on one or more VGAM1931 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65223] It is yet further appreciated that a function of VGAM1931 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1931 correlate with, and may be deduced from, the identity of the host target genes which VGAM1931 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[65224] Nucleotide sequences of the VGAM1931 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1931 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1931 are further described hereinbelow with reference to Table 1.

[65225] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1931 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1931 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65226] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1931 gene, herein designated VGAM is inhibition of expression of VGAM1931 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1931 correlate with, and may be deduced from, the identity of the target genes which VGAM1931 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[65227] Collagen, Type VI, Alpha 1 (COL6A1, Accession NM\_001848) is a VGAM1931 host target gene. COL6A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL6A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL6A1 BINDING SITE, designated SEQ ID:7584, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65228] A function of VGAM1931 is therefore inhibition of Collagen, Type VI, Alpha 1 (COL6A1, Accession NM\_001848). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL6A1. HIP12 (Accession XM\_038791) is another VGAM1931 host target gene. HIP12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIP12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of HIP12 BINDING SITE, designated SEQ ID:32922, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65229] Another function of VGAM1931 is therefore inhibition of HIP12 (Accession XM\_038791), a gene which is a component of clathrin-coated pits and vesicles, that may link the endocytic machinery to the actin cytoskeleton. Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP12. The function of HIP12 has been established by previous studies. Huntingtin-interacting protein-1 (HIP1; 601767) is a membrane-associated protein that interacts with huntingtin (OMIM Ref. No. 143100), the protein altered in Huntington disease. While attempting to isolate the mouse homolog of HIP1, Chopra et al. (2000) identified a homologous cDNA, which they designated Hip12. By screening a human frontal cortex cDNA library with an EST that showed homology to mouse Hip12, Chopra et al. (2000) cloned a full-length HIP12 cDNA encoding a deduced 1,068-amino acid protein that shares 47% sequence identity with HIP1. The highest degree of similarity occurs in the C-terminal region, which shows considerable homology to the cytoskeletal protein talin

(OMIM Ref. No. 186745). Northern blot analysis detected expression of a 5-kb HIP12 transcript in brain, heart, kidney, pancreas, and liver, but not in lung or placenta. In ES cell-derived neurons, both HIP1 and HIP12 are highly expressed and distributed throughout the cytoplasm and cell processes with enrichment within the cis-Golgi. In contrast to HIP1, which is toxic in cell culture, HIP12 does not confer toxicity in the same assay systems. HIP12 does not interact with huntingtin but can interact with HIP1, suggesting a potential interaction in vivo that may influence the function of each respective protein. By searching EST databases for homologs of yeast Sla2p, Engqvist-Goldstein et al. (1999) identified mouse and human cDNAs encoding HIP1R. The deduced human protein, which is 91% identical to the mouse sequence, is identical to the KIAA0655 protein reported by Ishikawa et al. (1998). It is also identical to the shorter sequence reported by Seki et al. (1998) except that it contains approximately 180 additional amino acids in its N terminus, including a conserved domain implicated in the endocytic function of Sla2p. HIP1R has 3 predicted coiled coils and a C-terminal talin-like domain, which Engqvist-Goldstein et al. (1999) confirmed binds F-actin in vitro. Northern blot analysis re-

vealed that mouse Hip1r is expressed ubiquitously, with reduced expression in skeletal muscle and heart, consistent with RT-PCR analysis of human HIP1R expression (Seki et al., 1998; Ishikawa et al., 1998). Fluorescence microscopy demonstrated that mouse Hip1r is expressed as punctate structures, enriched at the cell cortex and excluded from the nucleus, which colocalize with clathrin (see OMIM Ref. No. 118955) and other markers of receptor-mediated endocytosis.

[65230] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[65231] Chopra, V. S.; Metzler, M.; Rasper, D. M.; Engqvist-Goldstein, A. E. Y.; Singaraja, R.; Gan, L.; Fichter, K. M.; McCutcheon, K.; Drubin, D.; Nicholson, D. W.; Hayden, M. R. : HIP12 is a non-proapoptotic member of a gene family including HIP1, an interacting protein with huntingtin. Mammalian Genome 11: 1006-1015, 2000. ; and

[65232] Engqvist–Goldstein, A. E. Y.; Kessels, M. M.; Chopra, V. S.; Hayden, M. R.; Drubin, D. G. : An actin–binding protein of the Sla2/Huntingtin interacting protein 1 family is a novel compo.

[65233] Further studies establishing the function and utilities of HIP12 are found in John Hopkins OMIM database record ID 605613, and in cited publications numbered 717 and 9440–6775 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Splicing Factor, Arginine/serine–rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM\_006924) is another VGAM1931 host target gene. SFRS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS1 BINDING SITE, designated SEQ ID:13801, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65234] Another function of VGAM1931 is therefore inhibition of Splicing Factor, Arginine/serine–rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM\_006924), a

gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS1. The function of SFRS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.FLJ20436 (Accession NM\_017822) is another VGAM1931 host target gene. FLJ20436 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20436 BINDING SITE, designated SEQ ID:19472, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65235] Another function of VGAM1931 is therefore inhibition of FLJ20436 (Accession NM\_017822). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20436. KIAA1622 (Accession NM\_058237) is another VGAM1931 host target gene. KIAA1622 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1622 BINDING SITE, designated SEQ ID:27766, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65236] Another function of VGAM1931 is therefore inhibition of KIAA1622 (Accession NM\_058237). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1622. Zinc Finger Protein 212 (ZNF212, Accession NM\_012256) is another VGAM1931 host target gene. ZNF212 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF212 BINDING SITE, designated SEQ ID:14557, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65237] Another function of VGAM1931 is therefore inhibition of Zinc Finger Protein 212 (ZNF212, Accession NM\_012256). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF212. LOC145761 (Accession XM\_096855) is another VGAM1931 host target gene. LOC145761 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145761 BINDING SITE, designated SEQ ID:40584, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65238] Another function of VGAM1931 is therefore inhibition of LOC145761 (Accession XM\_096855). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145761. LOC146603 (Accession XM\_085514) is another VGAM1931 host target gene. LOC146603 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146603, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146603 BINDING SITE, designated SEQ ID:38215, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65239] Another function of VGAM1931 is therefore inhibition of LOC146603 (Accession XM\_085514). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146603. LOC202986 (Accession XM\_117489) is another VGAM1931 host target gene. LOC202986 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202986 BINDING SITE, designated SEQ ID:43470, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65240] Another function of VGAM1931 is therefore inhibition of LOC202986 (Accession XM\_117489). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC202986. LOC51312 (Accession NM\_018579) is another VGAM1931 host target gene. LOC51312 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51312 BINDING SITE, designated SEQ ID:20659, to the nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65241] Another function of VGAM1931 is therefore inhibition of LOC51312 (Accession NM\_018579). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51312. LOC57105 (Accession NM\_020377) is another VGAM1931 host target gene. LOC57105 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57105 BINDING SITE, designated SEQ ID:21639, to the

nucleotide sequence of VGAM1931 RNA, herein designated VGAM RNA, also designated SEQ ID:4642.

[65242] Another function of VGAM1931 is therefore inhibition of LOC57105 (Accession NM\_020377). Accordingly, utilities of VGAM1931 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57105. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1932 (VGAM1932) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65243] VGAM1932 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1932 was detected is described hereinabove with reference to Figs. 1–8.

[65244] VGAM1932 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM1932 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65245] VGAM1932 gene encodes a VGAM1932 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1932 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1932 precursor RNA is designated SEQ ID:1918, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1918 is located at position 159902 relative to the genome of Human Herpesvirus 4.

[65246] VGAM1932 precursor RNA folds onto itself, forming VGAM1932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65247] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1932 folded precursor RNA into VGAM1932 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1932 RNA is designated SEQ ID:4643, and is provided hereinbelow with reference to the sequence listing part.

[65248] VGAM1932 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1932 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65249] VGAM1932 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1932 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1932 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65250] The complementary binding of VGAM1932 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1932 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1932 host target RNA into VGAM1932 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65251] It is appreciated that VGAM1932 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1932 host target genes. The mRNA of each one of this plurality of VGAM1932 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1932 RNA, herein designated VGAM RNA, and which when bound by VGAM1932 RNA causes inhibition of translation of respective one or more VGAM1932 host target proteins.

[65252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1932 gene, herein designated VGAM GENE, on one or more VGAM1932 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[65253] It is yet further appreciated that a function of VGAM1932 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1932 correlate with, and may be deduced from, the identity of the host target genes which VGAM1932 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65254] Nucleotide sequences of the VGAM1932 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1932 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1932 are further described hereinbelow with reference to Table 1.

[65255] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1932 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1932 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65256] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1932 gene, herein designated VGAM is inhibition of expression of VGAM1932 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1932 correlate with, and may be deduced from, the identity of the target genes which VGAM1932 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65257] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM\_003778) is a VGAM1932 host target gene. B4GALT4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by B4GALT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT4 BINDING SITE, designated SEQ ID:9858, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65258] A function of VGAM1932 is therefore inhibition of UDP-

Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM\_003778). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT4. Glutamine-fructose-6-phosphate Transaminase 2 (GFPT2, Accession NM\_005110) is another VGAM1932 host target gene. GFPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFPT2 BINDING SITE, designated SEQ ID:11594, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65259] Another function of VGAM1932 is therefore inhibition of Glutamine-fructose-6-phosphate Transaminase 2 (GFPT2, Accession NM\_005110). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFPT2. Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM\_005628) is another VGAM1932 host target gene. SLC1A5 BINDING SITE1 and

SLC1A5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC1A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A5 BINDING SITE1 and SLC1A5 BINDING SITE2, designated SEQ ID:12142 and SEQ ID:38402 respectively, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65260] Another function of VGAM1932 is therefore inhibition of Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM\_005628). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A5. Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962) is another VGAM1932 host target gene. KCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, des-

ignated SEQ ID:30974, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65261] Another function of VGAM1932 is therefore inhibition of Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1. KIAA0258 (Accession NM\_014785) is another VGAM1932 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16648, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65262] Another function of VGAM1932 is therefore inhibition of KIAA0258 (Accession NM\_014785). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0514 (Accession NM\_014696) is another

VGAM1932 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16208, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65263] Another function of VGAM1932 is therefore inhibition of KIAA0514 (Accession NM\_014696). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA1987 (Accession XM\_113870) is another VGAM1932 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42498, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65264] Another function of VGAM1932 is therefore inhibition of KIAA1987 (Accession XM\_113870). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. MGC15854 (Accession NM\_145029) is another VGAM1932 host target gene. MGC15854 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15854 BINDING SITE, designated SEQ ID:29644, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65265] Another function of VGAM1932 is therefore inhibition of MGC15854 (Accession NM\_145029). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15854. MGC16279 (Accession XM\_031808) is another VGAM1932 host target gene. MGC16279 BINDING SITE1 and MGC16279 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC16279, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16279 BINDING SITE1 and MGC16279 BINDING SITE2, designated SEQ ID:31487 and SEQ ID:26733 respectively, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65266] Another function of VGAM1932 is therefore inhibition of MGC16279 (Accession XM\_031808). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16279. NY-REN-25 (Accession XM\_027116) is another VGAM1932 host target gene. NY-REN-25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NY-REN-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-25 BINDING SITE, designated SEQ ID:30417, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65267] Another function of VGAM1932 is therefore inhibition of NY-REN-25 (Accession XM\_027116). Accordingly, utilities

of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-25. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM\_047007) is another VGAM1932 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34878, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65268] Another function of VGAM1932 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM\_047007). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. PRO0902 (Accession NM\_053057) is another VGAM1932 host target gene. PRO0902 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0902 BINDING SITE, designated SEQ ID:27609, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65269] Another function of VGAM1932 is therefore inhibition of PRO0902 (Accession NM\_053057). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0902. Sideroflexin 2 (SFXN2, Accession XM\_058359) is another VGAM1932 host target gene. SFXN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFXN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN2 BINDING SITE, designated SEQ ID:36604, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65270] Another function of VGAM1932 is therefore inhibition of Sideroflexin 2 (SFXN2, Accession XM\_058359). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with SFXN2. Ubc6p (Accession NM\_058167) is another VGAM1932 host target gene. Ubc6p BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Ubc6p, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Ubc6p BINDING SITE, designated SEQ ID:27715, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65271] Another function of VGAM1932 is therefore inhibition of Ubc6p (Accession NM\_058167). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Ubc6p. LOC157450 (Accession XM\_048209) is another VGAM1932 host target gene. LOC157450 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157450 BINDING SITE, designated SEQ ID:35148, to the nucleotide sequence of VGAM1932 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4643.

[65272] Another function of VGAM1932 is therefore inhibition of LOC157450 (Accession XM\_048209). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157450. LOC51336 (Accession NM\_016646) is another VGAM1932 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:18758, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65273] Another function of VGAM1932 is therefore inhibition of LOC51336 (Accession NM\_016646). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. LOC91409 (Accession XM\_038298) is another VGAM1932 host target gene. LOC91409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91409, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91409 BINDING SITE, designated SEQ ID:32805, to the nucleotide sequence of VGAM1932 RNA, herein designated VGAM RNA, also designated SEQ ID:4643.

[65274] Another function of VGAM1932 is therefore inhibition of LOC91409 (Accession XM\_038298). Accordingly, utilities of VGAM1932 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91409. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1933 (VGAM1933) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65275] VGAM1933 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1933 was detected is described hereinabove with reference to Figs. 1-8.

[65276] VGAM1933 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4.

VGAM1933 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65277] VGAM1933 gene encodes a VGAM1933 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1933 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1933 precursor RNA is designated SEQ ID:1919, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1919 is located at position 156037 relative to the genome of Human Herpesvirus 4.

[65278] VGAM1933 precursor RNA folds onto itself, forming VGAM1933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65279] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1933 folded precursor RNA into VGAM1933 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1933 RNA is designated SEQ ID:4644, and is provided hereinbelow with reference to the sequence listing part.

[65280] VGAM1933 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1933 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65281] VGAM1933 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1933 RNA is an accurate or a partial inversed–reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1933 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65282] The complementary binding of VGAM1933 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1933 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1933 host target RNA into VGAM1933 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65283] It is appreciated that VGAM1933 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1933 host target genes. The mRNA of each one of this plurality of VGAM1933 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1933 RNA, herein designated VGAM RNA, and which when bound by VGAM1933 RNA causes inhibition of translation of respective one or more VGAM1933 host target proteins.

[65284] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1933 gene, herein designated VGAM GENE, on one or more VGAM1933 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65285] It is yet further appreciated that a function of VGAM1933 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1933 correlate with, and may be deduced from, the identity of the host target genes which VGAM1933 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65286] Nucleotide sequences of the VGAM1933 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1933 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1933 are further described hereinbelow with reference to Table 1.

[65287] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1933 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1933 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65288] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1933 gene, herein designated VGAM is inhibition of expression of VGAM1933 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1933 correlate with, and may be deduced from, the identity of the target genes which VGAM1933 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65289] Cadherin 8, Type 2 (CDH8, Accession NM\_001796) is a VGAM1933 host target gene. CDH8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDH8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH8 BINDING SITE, designated SEQ ID:7550, to the nucleotide sequence of

VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65290] A function of VGAM1933 is therefore inhibition of Cadherin 8, Type 2 (CDH8, Accession NM\_001796), a gene which plays an important role in development and maintenance of tissues. Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH8. The function of CDH8 has been established by previous studies. Cadherins are integral membrane proteins that mediate calcium-dependent cell-cell adhesion. They are thought to play an important role in development and maintenance of tissues and may be involved in the invasion and metastasis of malignant tumors. Mature cadherin proteins are composed of a large N-terminal extracellular domain, a single membrane-spanning domain, and a small C-terminal cytoplasmic domain. The extracellular domain consists of 5 subdomains, each containing a cadherin motif, and appears to determine the specificity of the homophilic cell adhesion activity of the cadherin; the amino acid sequence of the cytoplasmic domain is highly conserved among cadherins. By PCR using degenerate oligonucleotides based on highly conserved sequences of

the cadherin cytoplasmic domain, followed by screening of a human fetal brain cDNA library, Suzuki et al. (1991) isolated a partial cDNA encoding CDH8. Northern blot analysis detected Cdh8 expression only in rat brain, with multiple transcripts present. Tanihara et al. (1994) isolated a human brain cDNA containing the entire coding sequence of CDH8. The predicted 793-amino acid CDH8 protein contains a signal sequence, prosequence, extracellular domain, transmembrane sequence, and cytoplasmic domain. The extracellular domain of CDH8 has 66%, 58%, and 40% amino acid identity with the extracellular domains of human CDH11 (OMIM Ref. No. 600023), CDH12 (OMIM Ref. No. 600562), and CDH5 (OMIM Ref. No. 601120), respectively

[65291] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[65292] Kremmidiotis, G.; Baker, E.; Crawford, J.; Eyre, H. J.; Nahmias, J.; Callen, D. F. : Localization of human cadherin genes to chromosome regions exhibiting cancer-related loss of heterozygosity. *Genomics* 49: 467-471, 1998. ; and

[65293] Suzuki, S.; Sano, K.; Tanihara, H. : Diversity of the cad-

herin family: evidence for eight new cadherins in nervous tissue. *Cell Regul.* 2: 261–270, 1991.

[65294] Further studies establishing the function and utilities of CDH8 are found in John Hopkins OMIM database record ID 603008, and in cited publications numbered 1164 and 8336 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM\_000844) is another VGAM1933 host target gene. GRM7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM7 BINDING SITE, designated SEQ ID:6516, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65295] Another function of VGAM1933 is therefore inhibition of Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM\_000844), a gene which is mediated by a g-protein that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with GRM7. The function of GRM7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM746. Molybdenum Cofactor Synthesis 1 (MOCS1, Accession XM\_166358) is another VGAM1933 host target gene. MOCS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MOCS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOCS1 BINDING SITE, designated SEQ ID:44186, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65296] Another function of VGAM1933 is therefore inhibition of Molybdenum Cofactor Synthesis 1 (MOCS1, Accession XM\_166358). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS1. Neuralized-like (Drosophila) (NEURL, Accession NM\_004210) is another VGAM1933 host target gene. NEURL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEURL, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEURL BINDING SITE, designated SEQ ID:10410, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65297] Another function of VGAM1933 is therefore inhibition of Neuralized-like (Drosophila) (NEURL, Accession NM\_004210). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEURL. Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754) is another VGAM1933 host target gene. RUNX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:7495, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65298] Another function of VGAM1933 is therefore inhibition of

Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. Tripartite Motif-containing 8 (TRIM8, Accession NM\_030912) is another VGAM1933 host target gene. TRIM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM8 BINDING SITE, designated SEQ ID:25179, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65299] Another function of VGAM1933 is therefore inhibition of Tripartite Motif-containing 8 (TRIM8, Accession NM\_030912). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM8. Aldehyde Dehydrogenase 5 Family, Member A1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NM\_001080) is another VGAM1933 host target gene. ALDH5A1 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH5A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH5A1 BINDING SITE, designated SEQ ID:6740, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65300] Another function of VGAM1933 is therefore inhibition of Aldehyde Dehydrogenase 5 Family, Member A1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NM\_001080). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH5A1. Chromosome 22 Open Reading Frame 20 (C22orf20, Accession NM\_025225) is another VGAM1933 host target gene. C22orf20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf20 BINDING SITE, designated SEQ ID:24902, to the nucleotide sequence of VGAM1933 RNA,

herein designated VGAM RNA, also designated SEQ ID:4644.

[65301] Another function of VGAM1933 is therefore inhibition of Chromosome 22 Open Reading Frame 20 (C22orf20, Accession NM\_025225). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf20.

FLJ22969 (Accession XM\_044006) is another VGAM1933 host target gene. FLJ22969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22969 BINDING SITE, designated SEQ ID:34064, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65302] Another function of VGAM1933 is therefore inhibition of FLJ22969 (Accession XM\_044006). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22969. KIAA0441 (Accession NM\_014797) is another VGAM1933 host target gene. KIAA0441 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:16707, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65303] Another function of VGAM1933 is therefore inhibition of KIAA0441 (Accession NM\_014797). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. KIAA1265 (Accession XM\_047707) is another VGAM1933 host target gene. KIAA1265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1265 BINDING SITE, designated SEQ ID:35031, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65304] Another function of VGAM1933 is therefore inhibition of

KIAA1265 (Accession XM\_047707). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1265. KIAA1789 (Accession XM\_040486) is another VGAM1933 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:33309, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65305] Another function of VGAM1933 is therefore inhibition of KIAA1789 (Accession XM\_040486). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. NFASC (Accession XM\_046808) is another VGAM1933 host target gene. NFASC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFASC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of NFASC BINDING SITE, designated SEQ ID:34827, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65306] Another function of VGAM1933 is therefore inhibition of NFASC (Accession XM\_046808). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFASC. Paired Mesoderm Homeobox 2b (PMX2B, Accession NM\_003924) is another VGAM1933 host target gene. PMX2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMX2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX2B BINDING SITE, designated SEQ ID:10013, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65307] Another function of VGAM1933 is therefore inhibition of Paired Mesoderm Homeobox 2b (PMX2B, Accession NM\_003924). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PMX2B. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840) is another VGAM1933 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30766, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65308] Another function of VGAM1933 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. LOC146138 (Accession XM\_096938) is another VGAM1933 host target gene. LOC146138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC146138 BINDING SITE, designated SEQ ID:40653, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65309] Another function of VGAM1933 is therefore inhibition of LOC146138 (Accession XM\_096938). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146138. LOC146332 (Accession XM\_085413) is another VGAM1933 host target gene. LOC146332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146332 BINDING SITE, designated SEQ ID:38127, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65310] Another function of VGAM1933 is therefore inhibition of LOC146332 (Accession XM\_085413). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146332. LOC150311 (Accession XM\_086858) is an-

other VGAM1933 host target gene. LOC150311 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150311 BINDING SITE, designated SEQ ID:38927, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65311] Another function of VGAM1933 is therefore inhibition of LOC150311 (Accession XM\_086858). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150311. LOC150383 (Accession XM\_086905) is another VGAM1933 host target gene. LOC150383 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150383 BINDING SITE, designated SEQ ID:38944, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65312] Another function of VGAM1933 is therefore inhibition of LOC150383 (Accession XM\_086905). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150383. LOC154449 (Accession XM\_087928) is another VGAM1933 host target gene. LOC154449 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154449 BINDING SITE, designated SEQ ID:39474, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65313] Another function of VGAM1933 is therefore inhibition of LOC154449 (Accession XM\_087928). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154449. LOC158654 (Accession XM\_088632) is another VGAM1933 host target gene. LOC158654 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158654, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158654 BINDING SITE, designated SEQ ID:39875, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65314] Another function of VGAM1933 is therefore inhibition of LOC158654 (Accession XM\_088632). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158654. LOC253443 (Accession XM\_171074) is another VGAM1933 host target gene. LOC253443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253443 BINDING SITE, designated SEQ ID:45883, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65315] Another function of VGAM1933 is therefore inhibition of LOC253443 (Accession XM\_171074). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253443. LOC255388 (Accession XM\_173161) is another VGAM1933 host target gene. LOC255388 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255388 BINDING SITE, designated SEQ ID:46418, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65316] Another function of VGAM1933 is therefore inhibition of LOC255388 (Accession XM\_173161). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255388. LOC256310 (Accession XM\_172813) is another VGAM1933 host target gene. LOC256310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256310 BINDING SITE, designated SEQ ID:46095, to the nucleotide sequence of VGAM1933 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4644.

[65317] Another function of VGAM1933 is therefore inhibition of LOC256310 (Accession XM\_172813). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256310. LOC51701 (Accession NM\_016231) is another VGAM1933 host target gene. LOC51701 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51701 BINDING SITE, designated SEQ ID:18345, to the nucleotide sequence of VGAM1933 RNA, herein designated VGAM RNA, also designated SEQ ID:4644.

[65318] Another function of VGAM1933 is therefore inhibition of LOC51701 (Accession NM\_016231). Accordingly, utilities of VGAM1933 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51701. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1934 (VGAM1934) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65319] VGAM1934 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1934 was detected is described hereinabove with reference to Figs. 1–8.

[65320] VGAM1934 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM1934 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65321] VGAM1934 gene encodes a VGAM1934 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1934 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1934 precursor RNA is designated SEQ ID:1920, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1920 is located at position 157308 relative to the genome of Human Herpesvirus 4.

[65322] VGAM1934 precursor RNA folds onto itself, forming

VGAM1934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65323] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1934 folded precursor RNA into VGAM1934 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1934 RNA is designated SEQ ID:4645, and is provided hereinbelow with reference to the sequence listing part.

[65324] VGAM1934 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1934 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65325] VGAM1934 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1934 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1934 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65326] The complementary binding of VGAM1934 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1934 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1934 host target RNA into VGAM1934 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65327] It is appreciated that VGAM1934 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1934 host target genes. The mRNA of each one of this plurality of VGAM1934 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1934 RNA, herein designated VGAM RNA, and which when bound by VGAM1934 RNA causes inhibition of translation of respective one or more VGAM1934 host target proteins.

[65328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1934 gene, herein designated VGAM GENE, on one or more VGAM1934 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65329] It is yet further appreciated that a function of VGAM1934 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1934 correlate with, and may be deduced from, the identity of the host target genes which VGAM1934 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[65330] Nucleotide sequences of the VGAM1934 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1934 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1934 are further described hereinbelow with reference to Table 1.

[65331] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1934 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1934 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65332] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1934 gene, herein designated VGAM is inhibition of expression of VGAM1934 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1934 correlate with, and may be deduced from, the identity of the target genes which VGAM1934 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[65333] Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609) is a VGAM1934 host target gene. ACADSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACADSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:7315, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65334] A function of VGAM1934 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3A (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NM\_002711) is another VGAM1934 host target gene. PPP1R3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PPP1R3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3A BINDING SITE, designated SEQ ID:8563, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65335] Another function of VGAM1934 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3A (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NM\_002711), a gene which regulates phosphatase activity towards glycogen synthase, active in skeletal muscle. Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3A. The function of PPP1R3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1872.DKFZP564C103 (Accession NM\_015654) is another VGAM1934 host target gene. DKFZP564C103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564C103, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C103 BINDING SITE, designated SEQ ID:17900, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65336] Another function of VGAM1934 is therefore inhibition of DKFZP564C103 (Accession NM\_015654). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C103. FLJ22479 (Accession NM\_024900) is another VGAM1934 host target gene. FLJ22479 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22479 BINDING SITE, designated SEQ ID:24384, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65337] Another function of VGAM1934 is therefore inhibition of FLJ22479 (Accession NM\_024900). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ22479. Ganglioside Induced Differentiation Associated Protein 2 (GDAP2, Accession NM\_017686) is another VGAM1934 host target gene. GDAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GDAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDAP2 BINDING SITE, designated SEQ ID:19239, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65338] Another function of VGAM1934 is therefore inhibition of Ganglioside Induced Differentiation Associated Protein 2 (GDAP2, Accession NM\_017686). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDAP2. KIAA1317 (Accession XM\_098368) is another VGAM1934 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41629, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65339] Another function of VGAM1934 is therefore inhibition of KIAA1317 (Accession XM\_098368). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. Melanoma Antigen, Family B, 1 (MAGEB1, Accession NM\_002363) is another VGAM1934 host target gene. MAGEB1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAGEB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEB1 BINDING SITE, designated SEQ ID:8174, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65340] Another function of VGAM1934 is therefore inhibition of Melanoma Antigen, Family B, 1 (MAGEB1, Accession NM\_002363). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with MAGEB1. MISS (Accession NM\_144578) is another VGAM1934 host target gene. MISS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MISS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MISS BINDING SITE, designated SEQ ID:29382, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65341] Another function of VGAM1934 is therefore inhibition of MISS (Accession NM\_144578). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MISS. LOC126669 (Accession XM\_060121) is another VGAM1934 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37156, to the nucleotide sequence of VGAM1934 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4645.

[65342] Another function of VGAM1934 is therefore inhibition of LOC126669 (Accession XM\_060121). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669. LOC149670 (Accession XM\_086647) is another VGAM1934 host target gene. LOC149670 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149670, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149670 BINDING SITE, designated SEQ ID:38805, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65343] Another function of VGAM1934 is therefore inhibition of LOC149670 (Accession XM\_086647). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149670. LOC150174 (Accession XM\_086802) is another VGAM1934 host target gene. LOC150174 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150174, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:38870, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65344] Another function of VGAM1934 is therefore inhibition of LOC150174 (Accession XM\_086802). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174. LOC153894 (Accession XM\_087796) is another VGAM1934 host target gene. LOC153894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153894 BINDING SITE, designated SEQ ID:39426, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65345] Another function of VGAM1934 is therefore inhibition of LOC153894 (Accession XM\_087796). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153894. LOC161357 (Accession XM\_090827) is another VGAM1934 host target gene. LOC161357 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC161357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161357 BINDING SITE, designated SEQ ID:40018, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65346] Another function of VGAM1934 is therefore inhibition of LOC161357 (Accession XM\_090827). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161357. LOC255452 (Accession XM\_174088) is another VGAM1934 host target gene. LOC255452 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255452 BINDING SITE, designated SEQ ID:46571, to

the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65347] Another function of VGAM1934 is therefore inhibition of LOC255452 (Accession XM\_174088). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255452. LOC51652 (Accession NM\_016079) is another VGAM1934 host target gene. LOC51652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51652 BINDING SITE, designated SEQ ID:18151, to the nucleotide sequence of VGAM1934 RNA, herein designated VGAM RNA, also designated SEQ ID:4645.

[65348] Another function of VGAM1934 is therefore inhibition of LOC51652 (Accession NM\_016079). Accordingly, utilities of VGAM1934 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51652. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1935 (VGAM1935) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65349] VGAM1935 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1935 was detected is described hereinabove with reference to Figs. 1–8.

[65350] VGAM1935 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM1935 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65351] VGAM1935 gene encodes a VGAM1935 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1935 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1935 precursor RNA is designated SEQ ID:1921, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1921 is located at position 155556 relative to the genome of Human Herpesvirus 4.

[65352] VGAM1935 precursor RNA folds onto itself, forming VGAM1935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65353] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1935 folded precursor RNA into VGAM1935 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1935 RNA is designated SEQ ID:4646, and is provided hereinbelow with reference to the sequence listing part.

[65354] VGAM1935 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1935 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1935 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65355] VGAM1935 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1935 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1935 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65356] The complementary binding of VGAM1935 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1935 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1935 host target RNA into VGAM1935 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65357] It is appreciated that VGAM1935 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1935 host target genes. The mRNA of each one of this plurality of VGAM1935 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1935 RNA, herein designated VGAM RNA, and which when bound by VGAM1935 RNA causes inhibition of translation of respective one or more VGAM1935 host target proteins.

[65358] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1935 gene, herein designated VGAM GENE, on one or more VGAM1935 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65359] It is yet further appreciated that a function of VGAM1935 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1935 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1935 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65360] Nucleotide sequences of the VGAM1935 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1935 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1935 are further described hereinbelow with reference to Table 1.

[65361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1935 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1935 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65362] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1935 gene, herein designated VGAM is inhibition of expression of VGAM1935 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1935 correlate with, and may be deduced from, the identity of the target genes which VGAM1935

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65363] Carbonic Anhydrase XII (CA12, Accession NM\_001218) is a VGAM1935 host target gene. CA12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CA12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA12 BINDING SITE, designated SEQ ID:6880, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65364] A function of VGAM1935 is therefore inhibition of Carbonic Anhydrase XII (CA12, Accession NM\_001218), a gene which functions in cellular transport and metabolic processes. Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA12. The function of CA12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM508. Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM\_033096) is another VGAM1935 host target gene. CLTCL1 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLTCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLTCL1 BINDING SITE, designated SEQ ID:31836, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65365] Another function of VGAM1935 is therefore inhibition of Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM\_033096), a gene which is involved in vesicle budding. Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLTCL1. The function of CLTCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42. Casein Kinase 1, Gamma 3 (CSNK1G3, Accession NM\_004384) is another VGAM1935 host target gene. CSNK1G3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSNK1G3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of CSNK1G3 BINDING SITE, designated SEQ ID:10612, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65366] Another function of VGAM1935 is therefore inhibition of Casein Kinase 1, Gamma 3 (CSNK1G3, Accession NM\_004384). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1G3. Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM\_037302) is another VGAM1935 host target gene. EBAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EBAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EBAF BINDING SITE, designated SEQ ID:32610, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65367] Another function of VGAM1935 is therefore inhibition of Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta su-

perfamily) (EBAF, Accession XM\_037302), a gene which LEFT–RIGHT AXIS MALFORMATIONS. Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EBAF. The function of EBAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93. Glucagon–like Peptide 1 Receptor (GLP1R, Accession NM\_002062) is another VGAM1935 host target gene. GLP1R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GLP1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP1R BINDING SITE, designated SEQ ID:7824, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65368] Another function of VGAM1935 is therefore inhibition of Glucagon–like Peptide 1 Receptor (GLP1R, Accession NM\_002062), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GLP1R. The function of GLP1R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1652. Interleukin 10 Receptor, Alpha (IL10RA, Accession XM\_006447) is another VGAM1935 host target gene. IL10RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL10RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL10RA BINDING SITE, designated SEQ ID:30000, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65369] Another function of VGAM1935 is therefore inhibition of Interleukin 10 Receptor, Alpha (IL10RA, Accession XM\_006447), a gene which is a receptor for il-10. Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL10RA. The function of IL10RA and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

in above with reference to VGAM134. Myeloproliferative Leukemia Virus Oncogene (MPL, Accession NM\_005373) is another VGAM1935 host target gene. MPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPL BINDING SITE, designated SEQ ID:11850, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65370] Another function of VGAM1935 is therefore inhibition of Myeloproliferative Leukemia Virus Oncogene (MPL, Accession NM\_005373). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPL. ARNTL2 (Accession NM\_020183) is another VGAM1935 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ

ID:21418, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65371] Another function of VGAM1935 is therefore inhibition of ARNTL2 (Accession NM\_020183). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. BCL2-like 1 (BCL2L1, Accession NM\_138578) is another VGAM1935 host target gene. BCL2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L1 BINDING SITE, designated SEQ ID:28894, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65372] Another function of VGAM1935 is therefore inhibition of BCL2-like 1 (BCL2L1, Accession NM\_138578). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L1. Casein Kinase 1, Gamma 1 (CSNK1G1, Accession NM\_022048) is another VGAM1935 host target

gene. CSNK1G1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSNK1G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1G1 BINDING SITE, designated SEQ ID:22570, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65373] Another function of VGAM1935 is therefore inhibition of Casein Kinase 1, Gamma 1 (CSNK1G1, Accession NM\_022048). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1G1. DKFZP566G1424 (Accession XM\_097771) is another VGAM1935 host target gene. DKFZP566G1424 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566G1424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566G1424 BINDING SITE, designated SEQ ID:41117, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM

RNA, also designated SEQ ID:4646.

[65374] Another function of VGAM1935 is therefore inhibition of DKFZP566G1424 (Accession XM\_097771). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566G1424. DKFZp586I021 (Accession NM\_032271) is another VGAM1935 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26025, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65375] Another function of VGAM1935 is therefore inhibition of DKFZp586I021 (Accession NM\_032271). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. FLJ12547 (Accession NM\_024992) is another VGAM1935 host target gene. FLJ12547 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by FLJ12547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12547 BINDING SITE, designated SEQ ID:24549, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65376] Another function of VGAM1935 is therefore inhibition of FLJ12547 (Accession NM\_024992). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12547. FLJ20281 (Accession XM\_165663) is another VGAM1935 host target gene. FLJ20281 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20281 BINDING SITE, designated SEQ ID:43729, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65377] Another function of VGAM1935 is therefore inhibition of FLJ20281 (Accession XM\_165663). Accordingly, utilities of

VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20281. FLJ22341 (Accession NM\_024599) is another VGAM1935 host target gene. FLJ22341 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22341 BINDING SITE, designated SEQ ID:23848, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65378] Another function of VGAM1935 is therefore inhibition of FLJ22341 (Accession NM\_024599). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22341. HEMK (Accession NM\_016173) is another VGAM1935 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE,

designated SEQ ID:18271, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65379] Another function of VGAM1935 is therefore inhibition of HEMK (Accession NM\_016173). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM\_004979) is another VGAM1935 host target gene. KCND1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND1 BINDING SITE, designated SEQ ID:11427, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65380] Another function of VGAM1935 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM\_004979). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with KCND1. KIAA0939 (Accession XM\_030524) is another VGAM1935 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31063, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65381] Another function of VGAM1935 is therefore inhibition of KIAA0939 (Accession XM\_030524). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA1199 (Accession XM\_051860) is another VGAM1935 host target gene. KIAA1199 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1199 BINDING SITE, designated SEQ ID:35899, to the nucleotide sequence of VGAM1935 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4646.

[65382] Another function of VGAM1935 is therefore inhibition of KIAA1199 (Accession XM\_051860). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1199. KIAA1280 (Accession XM\_045766) is another VGAM1935 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34550, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65383] Another function of VGAM1935 is therefore inhibition of KIAA1280 (Accession XM\_045766). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. Kelch-like 6 (Drosophila) (KLHL6, Accession NM\_130446) is another VGAM1935 host target gene. KLHL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL6,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ ID:28214, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65384] Another function of VGAM1935 is therefore inhibition of Kelch-like 6 (*Drosophila*) (KLHL6, Accession NM\_130446). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6. Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM\_012316) is another VGAM1935 host target gene. KPNA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KPNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:14690, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65385] Another function of VGAM1935 is therefore inhibition of

Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM\_012316). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA6. MBLL39 (Accession NM\_005757) is another VGAM1935 host target gene.

MBLL39 BINDING SITE1 and MBLL39 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MBLL39, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE1 and MBLL39 BINDING SITE2, designated SEQ ID:12319 and SEQ ID:29576 respectively, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65386] Another function of VGAM1935 is therefore inhibition of MBLL39 (Accession NM\_005757). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBLL39. P66 (Accession NM\_020699) is another VGAM1935 host target gene. P66 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P66, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P66 BINDING SITE, designated SEQ ID:21846, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65387] Another function of VGAM1935 is therefore inhibition of P66 (Accession NM\_020699). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P66. Sialyltransferase 4B (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4B, Accession NM\_006927) is another VGAM1935 host target gene. SIAT4B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT4B BINDING SITE, designated SEQ ID:13813, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65388] Another function of VGAM1935 is therefore inhibition of Sialyltransferase 4B (beta-galactoside alpha-

2,3-sialyltransferase) (SIAT4B, Accession NM\_006927). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT4B. SSB-4 (Accession NM\_080862) is another VGAM1935 host target gene. SSB-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSB-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSB-4 BINDING SITE, designated SEQ ID:28105, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65389] Another function of VGAM1935 is therefore inhibition of SSB-4 (Accession NM\_080862). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-4. UBE3B (Accession XM\_084941) is another VGAM1935 host target gene. UBE3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of UBE3B BINDING SITE, designated SEQ ID:37774, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65390] Another function of VGAM1935 is therefore inhibition of UBE3B (Accession XM\_084941). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3B. LOC129198 (Accession XM\_072197) is another VGAM1935 host target gene. LOC129198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129198 BINDING SITE, designated SEQ ID:37466, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65391] Another function of VGAM1935 is therefore inhibition of LOC129198 (Accession XM\_072197). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129198. LOC158972 (Accession XM\_099009) is an-

other VGAM1935 host target gene. LOC158972 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158972 BINDING SITE, designated SEQ ID:42044, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65392] Another function of VGAM1935 is therefore inhibition of LOC158972 (Accession XM\_099009). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158972. LOC164395 (Accession XM\_092778) is another VGAM1935 host target gene. LOC164395 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164395 BINDING SITE, designated SEQ ID:40146, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65393] Another function of VGAM1935 is therefore inhibition of LOC164395 (Accession XM\_092778). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164395. LOC200261 (Accession XM\_114172) is another VGAM1935 host target gene. LOC200261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200261 BINDING SITE, designated SEQ ID:42750, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65394] Another function of VGAM1935 is therefore inhibition of LOC200261 (Accession XM\_114172). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200261. LOC221683 (Accession XM\_168089) is another VGAM1935 host target gene. LOC221683 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221683, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221683 BINDING SITE, designated SEQ ID:45006, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65395] Another function of VGAM1935 is therefore inhibition of LOC221683 (Accession XM\_168089). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221683. LOC254428 (Accession XM\_170932) is another VGAM1935 host target gene. LOC254428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:45720, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65396] Another function of VGAM1935 is therefore inhibition of LOC254428 (Accession XM\_170932). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254428. LOC84549 (Accession NM\_032509) is another VGAM1935 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26264, to the nucleotide sequence of VGAM1935 RNA, herein designated VGAM RNA, also designated SEQ ID:4646.

[65397] Another function of VGAM1935 is therefore inhibition of LOC84549 (Accession NM\_032509). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. LOC91056 (Accession XM\_170662) is another VGAM1935 host target gene. LOC91056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91056 BINDING SITE, designated SEQ ID:45440, to the nucleotide sequence of VGAM1935 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4646.

[65398] Another function of VGAM1935 is therefore inhibition of LOC91056 (Accession XM\_170662). Accordingly, utilities of VGAM1935 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91056. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1936 (VGAM1936) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65399] VGAM1936 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1936 was detected is described hereinabove with reference to Figs. 1–8.

[65400] VGAM1936 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM1936 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65401] VGAM1936 gene encodes a VGAM1936 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1936 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1936 precursor RNA is designated SEQ ID:1922, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1922 is located at position 152064 relative to the genome of Human Herpesvirus 4.

[65402] VGAM1936 precursor RNA folds onto itself, forming VGAM1936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65403] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1936 folded precursor RNA into VGAM1936 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1936 RNA is designated SEQ ID:4647, and is provided hereinbelow with reference to the sequence listing part.

[65404] VGAM1936 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1936 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65405] VGAM1936 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1936 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1936 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[65406] The complementary binding of VGAM1936 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1936 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1936 host target RNA into VGAM1936 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65407] It is appreciated that VGAM1936 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1936 host target genes. The mRNA of

each one of this plurality of VGAM1936 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1936 RNA, herein designated VGAM RNA, and which when bound by VGAM1936 RNA causes inhibition of translation of respective one or more VGAM1936 host target proteins.

[65408] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1936 gene, herein designated VGAM GENE, on one or more VGAM1936 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[65409] It is yet further appreciated that a function of VGAM1936 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1936 correlate with, and may be deduced from, the identity of the host target genes which VGAM1936 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65410] Nucleotide sequences of the VGAM1936 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1936 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1936 are further described hereinbelow with reference to Table 1.

[65411] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1936 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1936 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65412] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1936 gene, herein designated VGAM is inhibition of expression of VGAM1936 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1936 correlate with, and may be deduced from, the identity of the target genes which VGAM1936 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65413] Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM\_000025) is a VGAM1936 host target gene. ADRB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRB3 BINDING SITE, designated SEQ ID:5463, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65414] A function of VGAM1936 is therefore inhibition of Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM\_000025), a gene which stimulates adenylyl cyclase activity and reg-

ulates lipolysis. Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRB3. The function of ADRB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM179. Heat Shock Transcription Factor 4 (HSF4, Accession XM\_007871) is another VGAM1936 host target gene. HSF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSF4 BINDING SITE, designated SEQ ID:30067, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65415] Another function of VGAM1936 is therefore inhibition of Heat Shock Transcription Factor 4 (HSF4, Accession XM\_007871), a gene which activates heat-shock response genes under conditions of heat or other stresses. It was found that HSF4 bound specifically to the heat-shock response element but repressed, rather than activated, transcription. Accordingly, utilities of VGAM1936 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with HSF4. The function of HSF4 has been established by previous studies. Congenital cataracts cause 10 to 30% of all blindness in children, with one-third of cases estimated to have a genetic cause. Lamellar cataract (OMIM Ref. No. 116800) is the most common type of infantile cataract. Bu et al. (2002) carried out whole-genome linkage analysis of Chinese individuals with lamellar cataract, and found that the disorder is associated with inheritance of a 5.11-cM region on chromosome 16. This locus coincides with one previously described for Marner cataract (see OMIM Ref. No. 116800) by Eiberg et al. (1988). Bu et al. (2002) screened individuals of 3 Chinese families for mutations in HSF4 (a gene that maps to this locus) and discovered that in each family, a distinct missense mutation, predicted to affect the DNA-binding domain of the protein, segregated with the disorder. They also discovered an association between a missense mutation and Marner cataract in an extensive Danish family. Thus it appears that HSF4 is critical to lens development. Heat-shock transcription factors (HSFs) activate heat-shock response genes under conditions of heat or other stresses. Other members of the HSF family in-

clude HSF1 (OMIM Ref. No. 140580) and HSF2 (OMIM Ref. No. 140581). Using chicken HSF3 as a probe to screen a human HeLa cDNA library, Nakai et al. (1997) isolated an additional family member, termed HSF4 by the authors. Based on the low level of amino acid identity between chicken HSF3 and HSF4, Nakai et al. (1997) concluded that HSF4 is a novel member of the HSF family, rather than the human homolog of chicken HSF3. They reported that the HSF4 sequence encodes a 463–amino acid polypeptide. Northern blotting revealed that HSF4 is expressed as a 2.5–kb mRNA in the heart, skeletal muscle, and brain, and at much lower levels in some other tissues. Nakai et al. (1997) found that HSF4 bound specifically to the heat–shock response element but repressed, rather than activated, transcription

[65416] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[65417] Bu, L.; Jin, Y.; Shi, Y.; Chu, R.; Ban, A.; Eiberg, H.; Andres, L.; Jiang, H.; Zheng, G.; Qian, M.; Cui, B.; Xia, Y.; Liu, J.; Hu, L.; Zhao, G.; Hayden, M. R.; Kong, X. : Mutant DNA–binding domain of HSF4 is associated with autosomal dominant lamellar and Marner cataract. *Nature Genet.* 31:

276–278, 2002. ; and

[65418] Nakai, A.; Tanabe, M.; Kawazoe, Y.; Inazawa, J.; Morimoto, R. I.; Nagata, K. : HSF4, a new member of the human heat shock factor family which lacks properties of a transcriptional activator.

[65419] Further studies establishing the function and utilities of HSF4 are found in John Hopkins OMIM database record ID 602438, and in cited publications numbered 2022–202 and 5609 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 7 (SLC17A7, Accession NM\_020309) is another VGAM1936 host target gene. SLC17A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A7 BINDING SITE, designated SEQ ID:21557, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65420] Another function of VGAM1936 is therefore inhibition of

Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 7 (SLC17A7, Accession NM\_020309), a gene which is a brain-specific Na-dependent inorganic phosphate cotransporter. Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A7. The function of SLC17A7 has been established by previous studies. Bellocchio et al. (2000) demonstrated that BNPI transports glutamate into synaptic vesicles. In addition, they showed that this vesicular glutamate transporter, which they renamed VGLUT1, exhibits a conductance for chloride that is blocked by glutamate. Bellocchio et al. (2000) found that glutamate was transported by BNPI in the absence of sodium. Vesicular glutamate transport has a substantially lower apparent affinity than the plasma membrane excitatory amino acid transporters. Glutamate transport by BNPI is saturated with a  $K(m)$  of approximately 2 mM, in the same range as transport by synaptic vesicles. Finally, plasma membrane glutamate transporters recognize both aspartate and glutamate as substrates, whereas vesicular glutamate transport does not recognize aspartate. Vesicular glutamate transport has a biphasic dependence on chloride concentration

that may reflect the presence of anion binding site distinct from the site of substrate recognition. Chloride concentrations of approximately 4 to 10 mM appear optimal for transport, with substantially lower activity detected at higher and lower levels. BNPI transports glutamate with all of the functional characteristics previously reported for glutamate transport into native synaptic vesicles from the brain. It localizes to synaptic vesicles, and the mutant *C. elegans eat-4* (a BNPI ortholog) reduces glutamate release. BNPI thus functions as a vesicular glutamate transporter, VGLUT1. Only a subset of glutamate neurons expresses VGLUT1, but a closely related sequence has been identified that appears to be expressed in brain regions that lack VGLUT1 (Aihara et al., 2000). The 2 isoforms together may therefore account for the uptake of glutamate by synaptic vesicles from all glutamatergic neurons. VGLUT1 (BNPI1) may thus function as both a phosphate transporter, presumably at the plasma membrane, and a glutamate transporter in synaptic vesicles. Bellocchio et al. (2000) stated that the localization of VGLUT1 to synaptic vesicles, the phenotype of the *eat-4* mutant, and biochemical evidence strongly suggest that vesicular glutamate transport is its primary role. Takamori et al. (2000)

independently showed that expression of BNPI results in glutamate uptake by intracellular vesicles. Substrate specificity and energy dependence are very similar to glutamate uptake by synaptic vesicles. Stimulation of exocytosis resulted in quantal release of glutamate from BNPI-expressing cells. Furthermore, Takamori et al. (2000) expressed BNPI in neurons containing GABA (see OMIM Ref. No. 137150) and maintained them as cultures of single neurons that form synapses to themselves. After stimulation of these neurons, a component of the postsynaptic current is mediated by glutamate as it is blocked by a combination of the glutamate receptor antagonists, but is insensitive to a GABA-A receptor (see OMIM Ref. No. 137192) antagonist. Takamori et al. (2000) concluded that BNPI functions as a vesicular glutamate transporter and that expression of BNPI suffices to define a glutamatergic phenotype in neurons.

[65421] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[65422] Bellocchio, E. E.; Reimer, R. J.; Fremeau, R. T., Jr.; Edwards, R. H. : Uptake of glutamate into synaptic vesicles by an inorganic phosphate transporter. *Science* 289: 957–960,

2000. ; and

[65423] Takamori, S.; Rhee, J. S.; Rosenmund, C.; Jahn, R. : Identification of a vesicular glutamate transporter that defines a glutamatergic phenotype in neurons. *Nature* 407: 189–194, 2000.

[65424] Further studies establishing the function and utilities of SLC17A7 are found in John Hopkins OMIM database record ID 605208, and in cited publications numbered 6815–6818 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 5 (SLC7A5, Accession NM\_003486) is another VGAM1936 host target gene. SLC7A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A5 BINDING SITE, designated SEQ ID:9577, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65425] Another function of VGAM1936 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter,

y+ system), Member 5 (SLC7A5, Accession NM\_003486), a gene which mediates transport of large and small neutral amino acids. Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A5. The function of SLC7A5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Cell Division Cycle Associated 4 (CDCA4, Accession NM\_017955) is another VGAM1936 host target gene. CDCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDCA4 BINDING SITE, designated SEQ ID:19662, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65426] Another function of VGAM1936 is therefore inhibition of Cell Division Cycle Associated 4 (CDCA4, Accession NM\_017955). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with CDCA4. CTP Synthase II (CTPS2, Accession NM\_019857) is another VGAM1936 host target gene. CTPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTPS2 BINDING SITE, designated SEQ ID:21263, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65427] Another function of VGAM1936 is therefore inhibition of CTP Synthase II (CTPS2, Accession NM\_019857). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTPS2. dj309H15.1 (Accession NM\_138574) is another VGAM1936 host target gene. dj309H15.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by dj309H15.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of dj309H15.1 BINDING SITE, designated SEQ ID:28887, to

the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65428] Another function of VGAM1936 is therefore inhibition of dj309H15.1 (Accession NM\_138574). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with dj309H15.1. DKFZP434C171 (Accession NM\_015621) is another VGAM1936 host target gene. DKFZP434C171 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C171 BINDING SITE, designated SEQ ID:17884, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65429] Another function of VGAM1936 is therefore inhibition of DKFZP434C171 (Accession NM\_015621). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C171. DKFZP727C091 (Accession XM\_038689) is another VGAM1936 host target gene. DK-

FZP727C091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP727C091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727C091 BINDING SITE, designated SEQ ID:32903, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65430] Another function of VGAM1936 is therefore inhibition of DKFZP727C091 (Accession XM\_038689). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727C091. HSA243666 (Accession NM\_017582) is another VGAM1936 host target gene. HSA243666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA243666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA243666 BINDING SITE, designated SEQ ID:19020, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ

ID:4647.

[65431] Another function of VGAM1936 is therefore inhibition of HSA243666 (Accession NM\_017582). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA243666. KIAA0237 (Accession NM\_014747) is another VGAM1936 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16446, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65432] Another function of VGAM1936 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0953 (Accession XM\_039733) is another VGAM1936 host target gene. KIAA0953 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0953, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:33167, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65433] Another function of VGAM1936 is therefore inhibition of KIAA0953 (Accession XM\_039733). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953. KIAA1191 (Accession NM\_020444) is another VGAM1936 host target gene. KIAA1191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1191 BINDING SITE, designated SEQ ID:21685, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65434] Another function of VGAM1936 is therefore inhibition of KIAA1191 (Accession NM\_020444). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1191. KIAA1719 (Accession XM\_042936) is another VGAM1936 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33824, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65435] Another function of VGAM1936 is therefore inhibition of KIAA1719 (Accession XM\_042936). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. KIAA1853 (Accession XM\_045184) is another VGAM1936 host target gene. KIAA1853 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:34388, to the

nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65436] Another function of VGAM1936 is therefore inhibition of KIAA1853 (Accession XM\_045184). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853. KIAA1922 (Accession XM\_057040) is another VGAM1936 host target gene. KIAA1922 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:36454, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65437] Another function of VGAM1936 is therefore inhibition of KIAA1922 (Accession XM\_057040). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1922. Retinoic Acid Induced 17 (RAI17, Accession XM\_166091) is another VGAM1936 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43860, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65438] Another function of VGAM1936 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM\_166091). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. SCYA5 (Accession NM\_002985) is another VGAM1936 host target gene. SCYA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCYA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA5 BINDING SITE, designated SEQ ID:8882, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65439] Another function of VGAM1936 is therefore inhibition of SCYA5 (Accession NM\_002985). Accordingly, utilities of

VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA5. Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM\_013233) is another VGAM1936 host target gene. STK39 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK39 BINDING SITE, designated SEQ ID:14893, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65440] Another function of VGAM1936 is therefore inhibition of Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM\_013233). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK39. TGFB1-induced Anti-apoptotic Factor 1 (TIAF1, Accession NM\_078471) is another VGAM1936 host target gene. TIAF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIAF1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAF1 BINDING SITE, designated SEQ ID:27799, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65441] Another function of VGAM1936 is therefore inhibition of TGFBI-induced Anti-apoptotic Factor 1 (TIAF1, Accession NM\_078471). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAF1. LOC113763 (Accession NM\_138434) is another VGAM1936 host target gene. LOC113763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113763 BINDING SITE, designated SEQ ID:28799, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65442] Another function of VGAM1936 is therefore inhibition of LOC113763 (Accession NM\_138434). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC113763. LOC138389 (Accession XM\_072534) is another VGAM1936 host target gene. LOC138389 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138389 BINDING SITE, designated SEQ ID:37505, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65443] Another function of VGAM1936 is therefore inhibition of LOC138389 (Accession XM\_072534). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138389. LOC144465 (Accession XM\_084874) is another VGAM1936 host target gene. LOC144465 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144465 BINDING SITE, designated SEQ ID:37752, to

the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65444] Another function of VGAM1936 is therefore inhibition of LOC144465 (Accession XM\_084874). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144465. LOC146346 (Accession XM\_085430) is another VGAM1936 host target gene. LOC146346 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146346 BINDING SITE, designated SEQ ID:38138, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65445] Another function of VGAM1936 is therefore inhibition of LOC146346 (Accession XM\_085430). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146346. LOC151176 (Accession XM\_098016) is another VGAM1936 host target gene. LOC151176 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC151176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151176 BINDING SITE, designated SEQ ID:41316, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65446] Another function of VGAM1936 is therefore inhibition of LOC151176 (Accession XM\_098016). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151176. LOC163782 (Accession XM\_089138) is another VGAM1936 host target gene. LOC163782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163782 BINDING SITE, designated SEQ ID:39963, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65447] Another function of VGAM1936 is therefore inhibition of LOC163782 (Accession XM\_089138). Accordingly, utilities

of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163782. LOC200953 (Accession XM\_117302) is another VGAM1936 host target gene. LOC200953 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200953 BINDING SITE, designated SEQ ID:43369, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65448] Another function of VGAM1936 is therefore inhibition of LOC200953 (Accession XM\_117302). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200953. LOC220846 (Accession XM\_165515) is another VGAM1936 host target gene. LOC220846 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220846 BINDING SITE, designated SEQ ID:43664, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65449] Another function of VGAM1936 is therefore inhibition of LOC220846 (Accession XM\_165515). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220846. LOC257000 (Accession XM\_172999) is another VGAM1936 host target gene. LOC257000 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257000 BINDING SITE, designated SEQ ID:46274, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65450] Another function of VGAM1936 is therefore inhibition of LOC257000 (Accession XM\_172999). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257000. LOC92080 (Accession XM\_042704) is another VGAM1936 host target gene. LOC92080 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92080 BINDING SITE, designated SEQ ID:33755, to the nucleotide sequence of VGAM1936 RNA, herein designated VGAM RNA, also designated SEQ ID:4647.

[65451] Another function of VGAM1936 is therefore inhibition of LOC92080 (Accession XM\_042704). Accordingly, utilities of VGAM1936 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92080. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1937 (VGAM1937) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65452] VGAM1937 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1937 was detected is described hereinabove with reference to Figs. 1–8.

[65453] VGAM1937 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM1937 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65454] VGAM1937 gene encodes a VGAM1937 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1937 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1937 precursor RNA is designated SEQ ID:1923, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1923 is located at position 161986 relative to the genome of Human Herpesvirus 4.

[65455] VGAM1937 precursor RNA folds onto itself, forming VGAM1937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[65456] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1937 folded precursor RNA into VGAM1937 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1937 RNA is designated SEQ ID:4648, and is provided hereinbelow with reference to the sequence listing part.

[65457] VGAM1937 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1937 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65458] VGAM1937 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1937 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1937 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1937 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65459] The complementary binding of VGAM1937 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1937 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1937 host target RNA into VGAM1937 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65460] It is appreciated that VGAM1937 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1937 host target genes. The mRNA of each one of this plurality of VGAM1937 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1937 RNA, herein designated VGAM RNA, and which when bound by VGAM1937 RNA causes inhibition of translation of respective one or more VGAM1937 host target proteins.

[65461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1937 gene, herein designated VGAM GENE, on one or more VGAM1937 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65462] It is yet further appreciated that a function of VGAM1937 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1937 correlate with, and may be deduced from, the identity of the host target genes which VGAM1937 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65463] Nucleotide sequences of the VGAM1937 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1937 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1937 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1937 are further described hereinbelow with reference to Table 1.

[65464] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1937 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1937 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65465] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1937 gene, herein designated VGAM is inhibition of expression of VGAM1937 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1937 correlate with, and may be deduced from, the identity of the target genes which VGAM1937 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65466] RAN Binding Protein 3 (RANBP3, Accession NM\_007321) is a VGAM1937 host target gene. RANBP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RANBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of RANBP3 BINDING SITE, designated SEQ ID:14238, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65467] A function of VGAM1937 is therefore inhibition of RAN Binding Protein 3 (RANBP3, Accession NM\_007321). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP3. TIM3 (Accession NM\_032782) is another VGAM1937 host target gene. TIM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIM3 BINDING SITE, designated SEQ ID:26523, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65468] Another function of VGAM1937 is therefore inhibition of TIM3 (Accession NM\_032782), a gene which regulates macrophage activation and enhances the severity of experimental autoimmune encephalomyelitis in mice. Accordingly, utilities of VGAM1937 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with TIM3. The function of TIM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM909. ALK7 (Accession XM\_065712) is another VGAM1937 host target gene. ALK7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALK7 BINDING SITE, designated SEQ ID:37295, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65469] Another function of VGAM1937 is therefore inhibition of ALK7 (Accession XM\_065712). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALK7. C3F (Accession NM\_005768) is another VGAM1937 host target gene. C3F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C3F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of C3F BINDING SITE, designated SEQ ID:12332, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65470] Another function of VGAM1937 is therefore inhibition of C3F (Accession NM\_005768). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3F. DKFZP434N014 (Accession XM\_027012) is another VGAM1937 host target gene. DKFZP434N014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434N014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N014 BINDING SITE, designated SEQ ID:30390, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65471] Another function of VGAM1937 is therefore inhibition of DKFZP434N014 (Accession XM\_027012). Accordingly, utilities of VGAM1937 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434N014. FLJ11565 (Accession NM\_024657) is another VGAM1937 host target gene. FLJ11565 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11565 BINDING SITE, designated SEQ ID:23961, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65472] Another function of VGAM1937 is therefore inhibition of FLJ11565 (Accession NM\_024657). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11565. FLJ14775 (Accession NM\_032837) is another VGAM1937 host target gene. FLJ14775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14775 BINDING SITE, designated SEQ ID:26618, to the nucleotide

sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65473] Another function of VGAM1937 is therefore inhibition of FLJ14775 (Accession NM\_032837). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14775. FLJ20174 (Accession NM\_017699) is another VGAM1937 host target gene. FLJ20174 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20174 BINDING SITE, designated SEQ ID:19271, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65474] Another function of VGAM1937 is therefore inhibition of FLJ20174 (Accession NM\_017699). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20174. KIAA0620 (Accession XM\_030707) is another VGAM1937 host target gene. KIAA0620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0620 BINDING SITE, designated SEQ ID:31124, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65475] Another function of VGAM1937 is therefore inhibition of KIAA0620 (Accession XM\_030707). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0620. Mitogen-activated Protein Kinase Kinase Kinase 2 (MAP3K2, Accession NM\_006609) is another VGAM1937 host target gene. MAP3K2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K2 BINDING SITE, designated SEQ ID:13388, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65476] Another function of VGAM1937 is therefore inhibition of

Mitogen-activated Protein Kinase Kinase Kinase 2 (MAP3K2, Accession NM\_006609). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K2. Neurexophilin 3 (NXPH3, Accession XM\_037847) is another VGAM1937 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32719, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65477] Another function of VGAM1937 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM\_037847). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. START Domain Containing 7 (STARD7, Accession NM\_020151) is another VGAM1937 host target gene. STARD7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STARD7, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD7 BINDING SITE, designated SEQ ID:21356, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65478] Another function of VGAM1937 is therefore inhibition of START Domain Containing 7 (STARD7, Accession NM\_020151). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7. Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_016381) is another VGAM1937 host target gene. TREX1 BINDING SITE1 through TREX1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TREX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE1 through TREX1 BINDING SITE3, designated SEQ ID:18520, SEQ ID:27345 and SEQ ID:27336 respectively, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65479] Another function of VGAM1937 is therefore inhibition of Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_016381). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. LOC149373 (Accession XM\_086507) is another VGAM1937 host target gene. LOC149373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149373 BINDING SITE, designated SEQ ID:38720, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65480] Another function of VGAM1937 is therefore inhibition of LOC149373 (Accession XM\_086507). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149373. LOC149668 (Accession XM\_097692) is another VGAM1937 host target gene. LOC149668 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149668, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149668 BINDING SITE, designated SEQ ID:41031, to the nucleotide sequence of VGAM1937 RNA, herein designated VGAM RNA, also designated SEQ ID:4648.

[65481] Another function of VGAM1937 is therefore inhibition of LOC149668 (Accession XM\_097692). Accordingly, utilities of VGAM1937 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149668. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1938 (VGAM1938) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65482] VGAM1938 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1938 was detected is described hereinabove with reference to Figs. 1-8.

[65483] VGAM1938 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4.

VGAM1938 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65484] VGAM1938 gene encodes a VGAM1938 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1938 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1938 precursor RNA is designated SEQ ID:1924, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1924 is located at position 151796 relative to the genome of Human Herpesvirus 4.

[65485] VGAM1938 precursor RNA folds onto itself, forming VGAM1938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65486] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1938 folded precursor RNA into VGAM1938 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1938 RNA is designated SEQ ID:4649, and is provided hereinbelow with reference to the sequence listing part.

[65487] VGAM1938 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1938 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65488] VGAM1938 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1938 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1938 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65489] The complementary binding of VGAM1938 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1938 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1938 host target RNA into VGAM1938 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65490] It is appreciated that VGAM1938 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1938 host target genes. The mRNA of each one of this plurality of VGAM1938 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1938 RNA, herein designated VGAM RNA, and which when bound by VGAM1938 RNA causes inhibition of translation of respective one or more VGAM1938 host target proteins.

[65491] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1938 gene, herein designated VGAM GENE, on one or more VGAM1938 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65492] It is yet further appreciated that a function of VGAM1938 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1938 correlate with, and may be deduced from, the identity of the host target genes which VGAM1938 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65493] Nucleotide sequences of the VGAM1938 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1938 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1938 are further described hereinbelow with reference to Table 1.

[65494] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1938 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1938 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65495] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1938 gene, herein designated VGAM is inhibition of expression of VGAM1938 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1938 correlate with, and may be deduced from, the identity of the target genes which VGAM1938 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65496] Cyclin-dependent Kinase 2 (CDK2, Accession NM\_001798) is a VGAM1938 host target gene. CDK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK2 BINDING SITE, designated SEQ ID:7553, to the nucleotide se-

quence of VGAM1938 RNA, herein designated VGAM RNA, also designated SEQ ID:4649.

[65497] A function of VGAM1938 is therefore inhibition of Cyclin-dependent Kinase 2 (CDK2, Accession NM\_001798), a gene which plays a unique role in cell cycle regulation of vertebrate cells. Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK2. The function of CDK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1467. Zinc Finger Protein 83 (HPF1) (ZNF83, Accession NM\_018300) is another VGAM1938 host target gene. ZNF83 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF83, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF83 BINDING SITE, designated SEQ ID:20293, to the nucleotide sequence of VGAM1938 RNA, herein designated VGAM RNA, also designated SEQ ID:4649.

[65498] Another function of VGAM1938 is therefore inhibition of Zinc Finger Protein 83 (HPF1) (ZNF83, Accession

NM\_018300). Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF83. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536) is another VGAM1938 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10881, to the nucleotide sequence of VGAM1938 RNA, herein designated VGAM RNA, also designated SEQ ID:4649.

[65499] Another function of VGAM1938 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536). Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. FLJ20651 (Accession NM\_017919) is another VGAM1938 host target gene. FLJ20651 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20651 BINDING SITE, designated SEQ ID:19574, to the nucleotide sequence of VGAM1938 RNA, herein designated VGAM RNA, also designated SEQ ID:4649.

[65500] Another function of VGAM1938 is therefore inhibition of FLJ20651 (Accession NM\_017919). Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20651. KIAA0391 (Accession NM\_014672) is another VGAM1938 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16140, to the nucleotide sequence of VGAM1938 RNA, herein designated VGAM RNA, also designated SEQ ID:4649.

[65501] Another function of VGAM1938 is therefore inhibition of KIAA0391 (Accession NM\_014672). Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0391. LATS, Large Tumor Suppressor, Homolog 1 (Drosophila) (LATS1, Accession XM\_015547) is another VGAM1938 host target gene. LATS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LATS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LATS1 BINDING SITE, designated SEQ ID:30238, to the nucleotide sequence of VGAM1938 RNA, herein designated VGAM RNA, also designated SEQ ID:4649.

[65502] Another function of VGAM1938 is therefore inhibition of LATS, Large Tumor Suppressor, Homolog 1 (Drosophila) (LATS1, Accession XM\_015547). Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LATS1. MGC2452 (Accession NM\_032644) is another VGAM1938 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452 BINDING SITE,

designated SEQ ID:26375, to the nucleotide sequence of VGAM1938 RNA, herein designated VGAM RNA, also designated SEQ ID:4649.

[65503] Another function of VGAM1938 is therefore inhibition of MGC2452 (Accession NM\_032644). Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. LOC144473 (Accession XM\_096606) is another VGAM1938 host target gene. LOC144473 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144473 BINDING SITE, designated SEQ ID:40414, to the nucleotide sequence of VGAM1938 RNA, herein designated VGAM RNA, also designated SEQ ID:4649.

[65504] Another function of VGAM1938 is therefore inhibition of LOC144473 (Accession XM\_096606). Accordingly, utilities of VGAM1938 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144473. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1939 (VGAM1939) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65505] VGAM1939 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1939 was detected is described hereinabove with reference to Figs. 1–8.

[65506] VGAM1939 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Measles Virus. VGAM1939 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65507] VGAM1939 gene encodes a VGAM1939 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1939 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1939 precursor RNA is designated SEQ ID:1925, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1925 is located at position 15073 relative to the

genome of Measles Virus.

[65508] VGAM1939 precursor RNA folds onto itself, forming VGAM1939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65509] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1939 folded precursor RNA into VGAM1939 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1939 RNA is designated SEQ ID:4650, and is provided hereinbelow with reference to the sequence listing part.

[65510] VGAM1939 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1939 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[65511] VGAM1939 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1939 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1939 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65512] The complementary binding of VGAM1939 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1939 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1939 host target RNA into VGAM1939 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65513] It is appreciated that VGAM1939 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1939 host target genes. The mRNA of each one of this plurality of VGAM1939 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1939 RNA, herein designated VGAM RNA, and which when bound by VGAM1939 RNA causes inhibition of translation of respective one or more VGAM1939 host target proteins.

[65514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1939 gene, herein designated VGAM GENE, on one or more VGAM1939 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65515] It is yet further appreciated that a function of VGAM1939 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1939 include diagnosis, prevention and treatment of viral infection by Measles Virus. Specific functions, and accordingly utilities, of VGAM1939 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1939 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65516] Nucleotide sequences of the VGAM1939 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1939 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1939 are further described hereinbelow with reference to Table 1.

[65517] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1939 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1939 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65518] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1939 gene, herein designated VGAM is inhibition of expression of VGAM1939 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1939 correlate with, and may be deduced

from, the identity of the target genes which VGAM1939 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65519] Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM\_004979) is a VGAM1939 host target gene. KCND1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND1 BINDING SITE, designated SEQ ID:11423, to the nucleotide sequence of VGAM1939 RNA, herein designated VGAM RNA, also designated SEQ ID:4650.

[65520] A function of VGAM1939 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM\_004979). Accordingly, utilities of VGAM1939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND1. LOC122553 (Accession XM\_058630) is another VGAM1939 host target gene. LOC122553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122553, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:36686, to the nucleotide sequence of VGAM1939 RNA, herein designated VGAM RNA, also designated SEQ ID:4650.

[65521] Another function of VGAM1939 is therefore inhibition of LOC122553 (Accession XM\_058630). Accordingly, utilities of VGAM1939 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553. LOC157869 (Accession XM\_088409) is another VGAM1939 host target gene. LOC157869 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157869, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157869 BINDING SITE, designated SEQ ID:39676, to the nucleotide sequence of VGAM1939 RNA, herein designated VGAM RNA, also designated SEQ ID:4650.

[65522] Another function of VGAM1939 is therefore inhibition of LOC157869 (Accession XM\_088409). Accordingly, utilities of VGAM1939 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC157869. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1940 (VGAM1940) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65523] VGAM1940 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1940 was detected is described hereinabove with reference to Figs. 1–8.

[65524] VGAM1940 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1940 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65525] VGAM1940 gene encodes a VGAM1940 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1940 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1940 precursor RNA is desig-

nated SEQ ID:1926, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1926 is located at position 17783 relative to the genome of Variola Virus.

- [65526] VGAM1940 precursor RNA folds onto itself, forming VGAM1940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [65527] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1940 folded precursor RNA into VGAM1940 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1940 RNA is designated SEQ ID:4651, and is provided hereinbelow with reference to the sequence

listing part.

[65528] VGAM1940 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1940 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65529] VGAM1940 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1940 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1940 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65530] The complementary binding of VGAM1940 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1940 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1940 host target RNA into VGAM1940 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65531] It is appreciated that VGAM1940 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1940 host target genes. The mRNA of each one of this plurality of VGAM1940 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1940 RNA, herein designated VGAM

RNA, and which when bound by VGAM1940 RNA causes inhibition of translation of respective one or more VGAM1940 host target proteins.

[65532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1940 gene, herein designated VGAM GENE, on one or more VGAM1940 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65533] It is yet further appreciated that a function of VGAM1940 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1940 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1940 correlate with, and may be deduced from, the identity of the host target genes which VGAM1940 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65534] Nucleotide sequences of the VGAM1940 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1940 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1940 are further described hereinbelow with reference to Table 1.

[65535] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1940 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1940 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65536] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1940 gene, herein designated VGAM is

inhibition of expression of VGAM1940 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1940 correlate with, and may be deduced from, the identity of the target genes which VGAM1940 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65537] C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252) is a VGAM1940 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLECSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:14923, to the nucleotide sequence of VGAM1940 RNA, herein designated VGAM RNA, also designated SEQ ID:4651.

[65538] A function of VGAM1940 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252). Accordingly, utilities of VGAM1940 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CLECSF5. Interleukin 21 Receptor (IL21R, Accession NM\_021798) is another VGAM1940 host target gene. IL21R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL21R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL21R BINDING SITE, designated SEQ ID:22354, to the nucleotide sequence of VGAM1940 RNA, herein designated VGAM RNA, also designated SEQ ID:4651.

[65539] Another function of VGAM1940 is therefore inhibition of Interleukin 21 Receptor (IL21R, Accession NM\_021798), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM1940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL21R. The function of IL21R has been established by previous studies. Type I cytokine receptors include receptors for hematopoietic growth factors as well as for many of the interleukins (e.g., IL2; 147680). Some type I receptors are capable of signaling through homodimerization. Others share a common beta chain or the common cy-

tokine receptor gamma chain, gamma(c) (IL2RG; 308380), mutation of which results in X-linked severe combined immunodeficiency (300400 Ueda et al. (2002) found that the IL21R gene is the partner of BCL6 (OMIM Ref. No. 109565) in the t(3;16)(q27;p11) translocation. In 2 cases they found that the breakpoints on 16p11 were located within the 27-kb intron 1 of IL21R. As a result of t(3;16), the promoter region of IL21R was substituted for the regulatory sequences of BCL6 in the same transcriptional orientation. Fluorescence in situ chromosomal hybridization of lymphoma metaphase cells revealed fusion signals that contained both the BCL6 and IL21R sequences on the der(3)t(3;16) chromosome. To the list of nonimmunoglobulin partners of BCL6 translocations, this study added a new class of gene, i.e., cytokine receptor gene, the expression of which is closely associated with lymphoid cells. Animal model experiments lend further support to the function of IL21R. Kasaian et al. (2002) generated IL21r-deficient mice by homologous recombination and deletion of exon 1. The mice had normal NK cell development and responses to poly I:C in vivo or IL15 in vitro, but not to IL21. In wildtype mice, IL21 limited the growth but not activation of NK cells, but not T cells, in response to

IL15 or IL2 in antigen-free cultures. IL21 could boost the function of activated NK cells from these mice without promoting NK cell viability or preventing apoptosis. CD8 (see OMIM Ref. No. 186910)-positive T cells from either wildtype or Il21r -/- mice treated with IL15 proliferated and expressed high levels of CD44 (OMIM Ref. No. 107269), a marker for 'memory' T cells. Addition of IL21 counteracted the effects of IL15 in wildtype but not Il21r-deficient mice and also prevented the expansion of cells expressing the gamma-interferon (IFNG; 147570) receptor, CD119 (IFNGR1; 107470), as well as those expressing IL2RA (CD25; 147730) and IL2RB/IL15RB (CD122), but not IL2RG (CD132). IL21 enhanced proliferation and effector functions of wildtype cytolytic T cells stimulated with either anti-CD3 (see OMIM Ref. No. 186830) or allogeneic cells. Kasaian et al. (2002) proposed that IL21 promotes the transition between innate and adaptive immunity.

[65540] It is appreciated that the abovementioned animal model for IL21R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[65541] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [65542] Ueda, C.; Akasaka, T.; Kurata, M.; Maesako, Y.; Nishikori, M.; Ichinohasama, R.; Imada, K.; Uchiyama, T.; Ohno, H. : The gene for interleukin-21 receptor is the partner of BCL6 in t(13;16)(q27;p11), which is recurrently observed in diffuse large B-cell lymphoma. *Oncogene* 21: 368-376, 2002. ; and
- [65543] Kasaian, M. T.; Whitters, M. J.; Carter, L. L.; Lowe, L. D.; Jussif, J. M.; Deng, B.; Johnson, K. A.; Witek, J. S.; Senices, M.; Konz, R. F.; Wurster, A. L.; Donaldson, D. D.; Collins.
- [65544] Further studies establishing the function and utilities of IL21R are found in John Hopkins OMIM database record ID 605383, and in cited publications numbered 9015, 4416-441 and 1383 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Keratocan (KERA, Accession NM\_007035) is another VGAM1940 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE,

designated SEQ ID:13910, to the nucleotide sequence of VGAM1940 RNA, herein designated VGAM RNA, also designated SEQ ID:4651.

[65545] Another function of VGAM1940 is therefore inhibition of Keratocan (KERA, Accession NM\_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM1940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM723.V-yes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM\_005433) is another VGAM1940 host target gene. YES1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:11913, to the nucleotide sequence of VGAM1940 RNA, herein designated VGAM RNA, also designated SEQ ID:4651.

[65546] Another function of VGAM1940 is therefore inhibition of V–yes–1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM\_005433), a gene which is a putative protein–tyrosine kinase. Accordingly, utilities of VGAM1940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1. The function of YES1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.LOC200059 (Accession XM\_114104) is another VGAM1940 host target gene. LOC200059 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200059 BINDING SITE, designated SEQ ID:42700, to the nucleotide sequence of VGAM1940 RNA, herein designated VGAM RNA, also designated SEQ ID:4651.

[65547] Another function of VGAM1940 is therefore inhibition of LOC200059 (Accession XM\_114104). Accordingly, utilities of VGAM1940 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200059. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1941 (VGAM1941) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65548] VGAM1941 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1941 was detected is described hereinabove with reference to Figs. 1–8.

[65549] VGAM1941 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1941 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65550] VGAM1941 gene encodes a VGAM1941 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1941 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1941 precursor RNA is designated SEQ ID:1927, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1927 is located at position 17196 relative to the genome of Variola Virus.

- [65551] VGAM1941 precursor RNA folds onto itself, forming VGAM1941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [65552] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1941 folded precursor RNA into VGAM1941 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1941 RNA is designated SEQ ID:4652, and is provided hereinbelow with reference to the sequence listing part.

[65553] VGAM1941 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1941 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65554] VGAM1941 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1941 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1941 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65555] The complementary binding of VGAM1941 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1941 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1941 host target RNA into VGAM1941 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65556] It is appreciated that VGAM1941 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1941 host target genes. The mRNA of each one of this plurality of VGAM1941 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1941 RNA, herein designated VGAM RNA, and which when bound by VGAM1941 RNA causes

inhibition of translation of respective one or more VGAM1941 host target proteins.

[65557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1941 gene, herein designated VGAM GENE, on one or more VGAM1941 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65558] It is yet further appreciated that a function of VGAM1941 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1941 include diagnosis, prevention and

treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1941 correlate with, and may be deduced from, the identity of the host target genes which VGAM1941 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65559] Nucleotide sequences of the VGAM1941 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1941 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1941 are further described hereinbelow with reference to Table 1.

[65560] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1941 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1941 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65561] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1941 gene, herein designated VGAM is inhibition of expression of VGAM1941 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1941 correlate with, and may be deduced from, the identity of the target genes which VGAM1941 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65562] Adenosine Deaminase, TRNA-specific 1 (ADAT1, Accession NM\_012091) is a VGAM1941 host target gene. ADAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAT1 BINDING SITE, designated SEQ ID:14381, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65563] A function of VGAM1941 is therefore inhibition of Adenosine Deaminase, TRNA-specific 1 (ADAT1, Accession NM\_012091), a gene which TRNA-specific adenosine deaminase; deaminates A(37) in the anticodon loop of tRNA(Ala). Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAT1. The function of ADAT1

has been established by previous studies. The mammalian RNA-specific adenosine deaminases (ADARs; OMIM Ref. No. 601059) constitute a family of sequence-related proteins involved in pre-mRNA editing of nuclear transcripts through site-specific adenosine modification. Maas et al. (1999) identified and characterized a human ADAR-related protein that specifically deaminates adenosine-37 to inosine in eukaryotic tRNA(ala). They designated this predicted 502-amino acid protein 'adenosine deaminase acting on tRNA,' or ADAT1, and concluded that it probably represents the human counterpart of the yeast protein Tad1p. Southern blot analysis revealed that the ADAT1 enzyme is represented by a single gene. Northern blot analysis detected ADAT1 transcripts of approximately 5 and 6.5 kb in all human tissues, with highest expression levels in heart, brain, and pancreas. By radiation hybrid panel analysis, Maas et al. (2001) mapped the ADAT1 gene and the gene encoding lysyl tRNA synthetase (KARS; 601421) to 16q22.2-q22.3, with the gene for alanyl tRNA synthetase (AARS; 601065) positioned centromeric to the KARS and ADAT1 genes. They speculated that the clustering of 3 tRNA-specific genes, of which 2 are specific for tRNA(Ala), may indicate their evolutionary relatedness or

common factors involved in regulating their expression.

[65564] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[65565] Maas, S.; Gerber, A. P.; Rich, A. : Identification and characterization of a human tRNA-specific adenosine deaminase related to the ADAR family of pre-mRNA editing enzymes. Proc. Nat. Acad. Sci. 96: 8895–8900, 1999. ; and

[65566] Maas, S.; Kim, Y.-G.; Rich, A. : Genomic clustering of tRNA-specific adenosine deaminase ADAT1 and two tRNA synthetases. Mammalian Genome 12: 387–393, 2001.

[65567] Further studies establishing the function and utilities of ADAT1 are found in John Hopkins OMIM database record ID 604230, and in cited publications numbered 519 and 7815 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM\_045343) is another VGAM1941 host target gene. NBS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

NBS1 BINDING SITE, designated SEQ ID:34433, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65568] Another function of VGAM1941 is therefore inhibition of Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM\_045343), a gene which may be involved in repair of DNA double-strand breaks. Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBS1. The function of NBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450. Nuclear Receptor Coactivator 3 (NCOA3, Accession NM\_006534) is another VGAM1941 host target gene. NCOA3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NCOA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA3 BINDING SITE, designated SEQ ID:13285, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65569] Another function of VGAM1941 is therefore inhibition of Nuclear Receptor Coactivator 3 (NCOA3, Accession NM\_006534), a gene which directly binds nuclear receptors and stimulates the transcriptional activities in hormone-dependent fashion. Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA3. The function of NCOA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 2 (PPP1R2, Accession NM\_006241) is another VGAM1941 host target gene. PPP1R2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R2 BINDING SITE, designated SEQ ID:12906, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65570] Another function of VGAM1941 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 2

(PPP1R2, Accession NM\_006241), a gene which suggests a housekeeping promoter structure. Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R2. The function of PPP1R2 has been established by previous studies. Using a cosmid that contained the gene for phospholipase C-beta-3 (PLCB3; 600230), Lagercrantz et al. (1996) isolated and characterized a gene that they called PLCB3-neighboring gene (PNG). PLCB3 is located on 11q13. PNG had no striking similarity to other known genes at the DNA level, however, analysis of hybridization to a panel of somatic cell hybrids indicated the existence of related sequences on chromosomes 2, 4, 7, and 22. PNG showed expression of a 1-kb message in multiple tissues. The predicted protein is 119 amino acids long. The gene spans approximately 2.5 kb and is divided into 4 exons and 3 introns. It is located 4.4 kb upstream of PLCB3, with the 5-prime ends of each gene facing each other. The intragenic region showed separate CpG islands at each end separated by a stretch of 2 kb, characterized by periodic alteration of the GC content. A 5-prime flanking region of PNG did not contain TATA or CCAAT, suggesting to the authors a housekeeping promoter struc-

ture. Lagercrantz et al. (1996) described isolation and expression of the murine homolog. The predicted murine protein contains 203 amino acids

[65571] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[65572] Lagercrantz, J.; Carson, E.; Larsson, C.; Nordenskjold, M.; Weber, G. : Isolation and characterization of a novel gene close to the human phosphoinositide-specific phospholipase C beta-3 gene on chromosomal region 11q13. *Genomics* 31: 380-384, 1996. ; and

[65573] Lagercrantz, J.; Kedra, D.; Carson, E.; Nordenskjold, M.; Dumanski, J. P.; Weber, G.; Piehl, F. : Sequence and expression of the mouse homologue to human phospholipase C beta-3 neighbor.

[65574] Further studies establishing the function and utilities of PPP1R2 are found in John Hopkins OMIM database record ID 601792, and in cited publications numbered 5792-5799 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 2 (SLC10A2, Accession NM\_000452) is another VGAM1941 host target gene. SLC10A2 BINDING SITE1 and

SLC10A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC10A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC10A2 BINDING SITE1 and SLC10A2 BINDING SITE2, designated SEQ ID:6062 and SEQ ID:6061 respectively, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65575] Another function of VGAM1941 is therefore inhibition of Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 2 (SLC10A2, Accession NM\_000452). Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC10A2. Zinc Finger Protein 141 (clone pHZ-44) (ZNF141, Accession NM\_003441) is another VGAM1941 host target gene. ZNF141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF141

BINDING SITE, designated SEQ ID:9498, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65576] Another function of VGAM1941 is therefore inhibition of Zinc Finger Protein 141 (clone pHZ-44) (ZNF141, Accession NM\_003441). Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF141. Cellular Repressor of E1A-stimulated Genes (CREG, Accession NM\_003851) is another VGAM1941 host target gene. CREG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CREG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREG BINDING SITE, designated SEQ ID:9946, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65577] Another function of VGAM1941 is therefore inhibition of Cellular Repressor of E1A-stimulated Genes (CREG, Accession NM\_003851). Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREG. KIAA0349

(Accession XM\_166449) is another VGAM1941 host target gene. KIAA0349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0349 BINDING SITE, designated SEQ ID:44339, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65578] Another function of VGAM1941 is therefore inhibition of KIAA0349 (Accession XM\_166449). Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0349. LOC153743 (Accession XM\_018216) is another VGAM1941 host target gene. LOC153743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153743 BINDING SITE, designated SEQ ID:30348, to the nucleotide sequence of VGAM1941 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4652.

[65579] Another function of VGAM1941 is therefore inhibition of LOC153743 (Accession XM\_018216). Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153743. LOC200227 (Accession XM\_114162) is another VGAM1941 host target gene. LOC200227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200227 BINDING SITE, designated SEQ ID:42747, to the nucleotide sequence of VGAM1941 RNA, herein designated VGAM RNA, also designated SEQ ID:4652.

[65580] Another function of VGAM1941 is therefore inhibition of LOC200227 (Accession XM\_114162). Accordingly, utilities of VGAM1941 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200227. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1942 (VGAM1942) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65581] VGAM1942 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1942 was detected is described hereinabove with reference to Figs. 1–8.

[65582] VGAM1942 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1942 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65583] VGAM1942 gene encodes a VGAM1942 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1942 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1942 precursor RNA is designated SEQ ID:1928, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1928 is located at position 17313 relative to the genome of Variola Virus.

[65584] VGAM1942 precursor RNA folds onto itself, forming

VGAM1942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65585] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1942 folded precursor RNA into VGAM1942 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1942 RNA is designated SEQ ID:4653, and is provided hereinbelow with reference to the sequence listing part.

[65586] VGAM1942 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1942 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65587] VGAM1942 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1942 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1942 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65588] The complementary binding of VGAM1942 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1942 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1942 host target RNA into VGAM1942 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65589] It is appreciated that VGAM1942 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1942 host target genes. The mRNA of each one of this plurality of VGAM1942 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1942 RNA, herein designated VGAM RNA, and which when bound by VGAM1942 RNA causes inhibition of translation of respective one or more VGAM1942 host target proteins.

[65590] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1942 gene, herein designated VGAM GENE, on one or more VGAM1942 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65591] It is yet further appreciated that a function of VGAM1942 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1942 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1942 correlate with, and may be deduced from, the identity of the host target genes which VGAM1942 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[65592] Nucleotide sequences of the VGAM1942 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1942 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1942 are further described hereinbelow with reference to Table 1.

[65593] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM1942 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1942 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65594] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1942 gene, herein designated VGAM is inhibition of expression of VGAM1942 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1942 correlate with, and may be deduced from, the identity of the target genes which VGAM1942 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[65595] Cyclin-dependent Kinase Inhibitor 1A (p21, Cip1) (CDKN1A, Accession NM\_078467) is a VGAM1942 host target gene. CDKN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1A BINDING SITE, designated SEQ ID:27782, to the nucleotide sequence of VGAM1942 RNA, herein designated VGAM RNA, also designated SEQ ID:4653.

[65596] A function of VGAM1942 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 1A (p21, Cip1) (CDKN1A, Accession NM\_078467), a gene which inhibits cyclin-kinase activity and probably serves as the effector of p53 cell cycle control. Accordingly, utilities of VGAM1942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN1A. The function of CDKN1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1912. Phosphatidylinositol-4-phosphate 5-kinase,

Type I, Gamma (PIP5K1C, Accession XM\_047620) is another VGAM1942 host target gene. PIP5K1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP5K1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1C BINDING SITE, designated SEQ ID:35014, to the nucleotide sequence of VGAM1942 RNA, herein designated VGAM RNA, also designated SEQ ID:4653.

[65597] Another function of VGAM1942 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM\_047620). Accordingly, utilities of VGAM1942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1C. LOC253792 (Accession XM\_173186) is another VGAM1942 host target gene. LOC253792 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253792 BINDING SITE, designated SEQ ID:46430, to

the nucleotide sequence of VGAM1942 RNA, herein designated VGAM RNA, also designated SEQ ID:4653.

[65598] Another function of VGAM1942 is therefore inhibition of LOC253792 (Accession XM\_173186). Accordingly, utilities of VGAM1942 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253792. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1943 (VGAM1943) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65599] VGAM1943 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1943 was detected is described hereinabove with reference to Figs. 1–8.

[65600] VGAM1943 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus.

VGAM1943 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65601] VGAM1943 gene encodes a VGAM1943 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1943 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1943 precursor RNA is designated SEQ ID:1929, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1929 is located at position 6220 relative to the genome of Variola Virus.

[65602] VGAM1943 precursor RNA folds onto itself, forming VGAM1943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65603] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1943 folded precursor RNA into VGAM1943 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1943 RNA is designated SEQ ID:4654, and is provided hereinbelow with reference to the sequence listing part.

[65604] VGAM1943 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1943 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65605] VGAM1943 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1943 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1943 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65606] The complementary binding of VGAM1943 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1943 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1943 host target RNA into VGAM1943 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65607] It is appreciated that VGAM1943 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1943 host target genes. The mRNA of each one of this plurality of VGAM1943 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1943 RNA, herein designated VGAM RNA, and which when bound by VGAM1943 RNA causes inhibition of translation of respective one or more VGAM1943 host target proteins.

[65608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1943 gene, herein designated VGAM GENE, on one or more VGAM1943 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[65609] It is yet further appreciated that a function of VGAM1943 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1943 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1943 correlate with, and may be deduced from, the identity of the host target genes which VGAM1943 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65610] Nucleotide sequences of the VGAM1943 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1943 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1943 are further described hereinbelow with reference to Table 1.

[65611] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1943 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1943 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65612] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1943 gene, herein designated VGAM is inhibition of expression of VGAM1943 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1943 correlate with, and may be deduced from, the identity of the target genes which VGAM1943 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65613] Protein Kinase, CAMP-dependent, Regulatory, Type II, Beta (PRKAR2B, Accession NM\_002736) is a VGAM1943 host target gene. PRKAR2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKAR2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR2B BINDING SITE, designated SEQ ID:8610, to the nucleotide sequence of VGAM1943 RNA, herein designated VGAM RNA, also designated SEQ ID:4654.

[65614] A function of VGAM1943 is therefore inhibition of Protein

Kinase, CAMP-dependent, Regulatory, Type II, Beta (PRKAR2B, Accession NM\_002736), a gene which type ii regulatory chains mediate membrane association by binding to anchoring proteins, including the map2 kinase. Accordingly, utilities of VGAM1943 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR2B. The function of PRKAR2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1944 (VGAM1944) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65615] VGAM1944 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1944 was detected is described hereinabove with reference to Figs. 1-8.

[65616] VGAM1944 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus.

VGAM1944 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[65617] VGAM1944 gene encodes a VGAM1944 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1944 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1944 precursor RNA is designated SEQ ID:1930, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1930 is located at position 4789 relative to the genome of Variola Virus.

[65618] VGAM1944 precursor RNA folds onto itself, forming VGAM1944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65619] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1944 folded precursor RNA into VGAM1944

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1944 RNA is designated SEQ ID:4655, and is provided hereinbelow with reference to the sequence listing part.

[65620] VGAM1944 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1944 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65621] VGAM1944 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1944 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1944 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65622] The complementary binding of VGAM1944 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1944 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1944 host target RNA into VGAM1944 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[65623] It is appreciated that VGAM1944 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1944 host target genes. The mRNA of each one of this plurality of VGAM1944 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1944 RNA, herein designated VGAM RNA, and which when bound by VGAM1944 RNA causes inhibition of translation of respective one or more VGAM1944 host target proteins.

[65624] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1944 gene, herein designated VGAM GENE, on one or more VGAM1944 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65625] It is yet further appreciated that a function of VGAM1944 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1944 correlate with, and may be deduced from, the identity of the host target genes which VGAM1944 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65626] Nucleotide sequences of the VGAM1944 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1944 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1944 are further described hereinbelow with reference to Table 1.

[65627] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1944 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1944 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65628] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1944 gene, herein designated VGAM is inhibition of expression of VGAM1944 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1944 correlate with, and may be deduced from, the identity of the target genes which VGAM1944 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65629] Osteoglycin (osteoinductive factor, mimecan) (OGN, Accession NM\_014057) is a VGAM1944 host target gene. OGN BINDING SITE1 through OGN BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OGN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGN BINDING SITE1 through OGN BINDING SITE3, designated SEQ ID:15276,

SEQ ID:23656 and SEQ ID:26900 respectively, to the nucleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, also designated SEQ ID:4655.

[65630] A function of VGAM1944 is therefore inhibition of Osteoglycin (osteoinductive factor, mimecan) (OGN, Accession NM\_014057), a gene which induces ectopic bone formation in conjunction with transforming growth factor beta. Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGN. The function of OGN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM346.CCR4-NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM\_013354) is another VGAM1944 host target gene. CNOT7 BINDING SITE1 and CNOT7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CNOT7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT7 BINDING SITE1 and CNOT7 BINDING SITE2, designated SEQ ID:15001 and SEQ ID:13526 respectively, to the nu-

cleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, also designated SEQ ID:4655.

[65631] Another function of VGAM1944 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM\_013354). Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT7. FLJ13769 (Accession NM\_025012) is another VGAM1944 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24597, to the nucleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, also designated SEQ ID:4655.

[65632] Another function of VGAM1944 is therefore inhibition of FLJ13769 (Accession NM\_025012). Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769. KIAA0750 (Accession NM\_014632) is another VGAM1944 host target gene. KIAA0750 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0750 BINDING SITE, designated SEQ ID:16000, to the nucleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, also designated SEQ ID:4655.

[65633] Another function of VGAM1944 is therefore inhibition of KIAA0750 (Accession NM\_014632). Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0750. Sp2 Transcription Factor (SP2, Accession NM\_003110) is another VGAM1944 host target gene. SP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP2 BINDING SITE, designated SEQ ID:9079, to the nucleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, also designated SEQ ID:4655.

[65634] Another function of VGAM1944 is therefore inhibition of

Sp2 Transcription Factor (SP2, Accession NM\_003110). Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP2. LOC120772 (Accession XM\_058505) is another VGAM1944 host target gene. LOC120772 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC120772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120772 BINDING SITE, designated SEQ ID:36627, to the nucleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, also designated SEQ ID:4655.

[65635] Another function of VGAM1944 is therefore inhibition of LOC120772 (Accession XM\_058505). Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120772. LOC147929 (Accession XM\_085961) is another VGAM1944 host target gene. LOC147929 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147929, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147929 BINDING SITE, designated SEQ ID:38419, to the nucleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, also designated SEQ ID:4655.

[65636] Another function of VGAM1944 is therefore inhibition of LOC147929 (Accession XM\_085961). Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147929. LOC256867 (Accession XM\_170694) is another VGAM1944 host target gene. LOC256867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256867 BINDING SITE, designated SEQ ID:45470, to the nucleotide sequence of VGAM1944 RNA, herein designated VGAM RNA, also designated SEQ ID:4655.

[65637] Another function of VGAM1944 is therefore inhibition of LOC256867 (Accession XM\_170694). Accordingly, utilities of VGAM1944 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256867. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1945 (VGAM1945) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65638] VGAM1945 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1945 was detected is described hereinabove with reference to Figs. 1–8.

[65639] VGAM1945 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1945 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65640] VGAM1945 gene encodes a VGAM1945 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1945 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1945 precursor RNA is designated SEQ ID:1931, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1931 is located at position 7746 relative to the genome of Variola Virus.

- [65641] VGAM1945 precursor RNA folds onto itself, forming VGAM1945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [65642] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1945 folded precursor RNA into VGAM1945 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1945 RNA is designated SEQ ID:4656, and is provided hereinbelow with reference to the sequence listing part.

[65643] VGAM1945 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1945 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65644] VGAM1945 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1945 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1945 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65645] The complementary binding of VGAM1945 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1945 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1945 host target RNA into VGAM1945 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65646] It is appreciated that VGAM1945 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1945 host target genes. The mRNA of each one of this plurality of VGAM1945 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1945 RNA, herein designated VGAM RNA, and which when bound by VGAM1945 RNA causes

inhibition of translation of respective one or more VGAM1945 host target proteins.

[65647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1945 gene, herein designated VGAM GENE, on one or more VGAM1945 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65648] It is yet further appreciated that a function of VGAM1945 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1945 include diagnosis, prevention and

treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1945 correlate with, and may be deduced from, the identity of the host target genes which VGAM1945 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65649] Nucleotide sequences of the VGAM1945 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1945 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1945 are further described hereinbelow with reference to Table 1.

[65650] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1945 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1945 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65651] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1945 gene, herein designated VGAM is inhibition of expression of VGAM1945 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1945 correlate with, and may be deduced from, the identity of the target genes which VGAM1945 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65652] Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM\_006915) is a VGAM1945 host target gene. RP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:13790, to the nucleotide sequence of VGAM1945 RNA, herein designated VGAM RNA, also designated SEQ ID:4656.

[65653] A function of VGAM1945 is therefore inhibition of Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM\_006915). Accordingly, utilities of VGAM1945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2. caspr5 (Accession NM\_130773) is another VGAM1945 host target gene. caspr5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

caspr5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of caspr5 BINDING SITE, designated SEQ ID:28267, to the nucleotide sequence of VGAM1945 RNA, herein designated VGAM RNA, also designated SEQ ID:4656.

[65654] Another function of VGAM1945 is therefore inhibition of caspr5 (Accession NM\_130773). Accordingly, utilities of VGAM1945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with caspr5. FLJ11252 (Accession XM\_041702) is another VGAM1945 host target gene. FLJ11252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11252 BINDING SITE, designated SEQ ID:33566, to the nucleotide sequence of VGAM1945 RNA, herein designated VGAM RNA, also designated SEQ ID:4656.

[65655] Another function of VGAM1945 is therefore inhibition of FLJ11252 (Accession XM\_041702). Accordingly, utilities of

VGAM1945 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11252. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1946 (VGAM1946) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65656] VGAM1946 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1946 was detected is described hereinabove with reference to Figs. 1–8.

[65657] VGAM1946 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus.

VGAM1946 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65658] VGAM1946 gene encodes a VGAM1946 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1946 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu–

cleotide sequence of VGAM1946 precursor RNA is designated SEQ ID:1932, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1932 is located at position 11538 relative to the genome of Variola Virus.

[65659] VGAM1946 precursor RNA folds onto itself, forming VGAM1946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65660] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1946 folded precursor RNA into VGAM1946 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1946 RNA is designated SEQ ID:4657, and

is provided hereinbelow with reference to the sequence listing part.

[65661] VGAM1946 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1946 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65662] VGAM1946 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1946 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1946 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65663] The complementary binding of VGAM1946 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1946 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1946 host target RNA into VGAM1946 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65664] It is appreciated that VGAM1946 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1946 host target genes. The mRNA of each one of this plurality of VGAM1946 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1946 RNA, herein designated VGAM RNA, and which when bound by VGAM1946 RNA causes inhibition of translation of respective one or more VGAM1946 host target proteins.

[65665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1946 gene, herein designated VGAM GENE, on one or more VGAM1946 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65666] It is yet further appreciated that a function of VGAM1946 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1946 correlate with, and may be deduced from, the identity of the host target genes which VGAM1946 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65667] Nucleotide sequences of the VGAM1946 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1946 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1946 are further described hereinbelow with reference to Table 1.

[65668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1946 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1946 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65669] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1946 gene, herein designated VGAM is inhibition of expression of VGAM1946 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1946 correlate with, and may be deduced from, the identity of the target genes which VGAM1946 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65670] Angiotensin II Receptor, Type 1 (AGTR1, Accession NM\_000685) is a VGAM1946 host target gene. AGTR1 BINDING SITE1 through AGTR1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGTR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGTR1 BINDING SITE1 through AGTR1 BINDING SITE5, designated SEQ ID:6343, SEQ ID:11244, SEQ ID:14310, SEQ ID:25595 and SEQ ID:25770 respectively, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65671] A function of VGAM1946 is therefore inhibition of Angiotensin II Receptor, Type 1 (AGTR1, Accession NM\_000685), a gene which is an important effector con-

trolling blood pressure and volume in the cardiovascular system. Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGTR1. The function of AGTR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM96.Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is another VGAM1946 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45231, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65672] Another function of VGAM1946 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utili-

ties of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. MAP-kinase Activating Death Domain (MADD, Accession NM\_130471) is another VGAM1946 host target gene. MADD BINDING SITE1 through MADD BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MADD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADD BINDING SITE1 through MADD BINDING SITE6, designated SEQ ID:28241, SEQ ID:28246, SEQ ID:28251, SEQ ID:28256, SEQ ID:9786 and SEQ ID:28235 respectively, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65673] Another function of VGAM1946 is therefore inhibition of MAP-kinase Activating Death Domain (MADD, Accession NM\_130471), a gene which may regulate two different pathways for neural activities. interacts with the type-1 tu-

mor necrosis factor receptor (TNFR1); death domain-containing protein. Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADD. The function of MADD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Ribulose-5-phosphate-3-epimerase (RPE, Accession XM\_030834) is another VGAM1946 host target gene. RPE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPE BINDING SITE, designated SEQ ID:31158, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65674] Another function of VGAM1946 is therefore inhibition of Ribulose-5-phosphate-3-epimerase (RPE, Accession XM\_030834). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPE. Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3

(SLC6A3, Accession NM\_001044) is another VGAM1946 host target gene. SLC6A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A3 BINDING SITE, designated SEQ ID:6712, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65675] Another function of VGAM1946 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM\_001044), a gene which terminates the action of dopamine by its high affinity sodium-dependent reuptake into presynaptic terminals. Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A3. The function of SLC6A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1753. Tec Protein Tyrosine Kinase (TEC, Accession NM\_003215) is another VGAM1946 host target gene. TEC

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEC BINDING SITE, designated SEQ ID:9220, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65676] Another function of VGAM1946 is therefore inhibition of Tec Protein Tyrosine Kinase (TEC, Accession NM\_003215). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEC. Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM\_021083) is another VGAM1946 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22053, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65677] Another function of VGAM1946 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM\_021083). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. Cyldromatosis (turban tumor syndrome) (CYLD, Accession NM\_015247) is another VGAM1946 host target gene. CYLD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYLD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLD BINDING SITE, designated SEQ ID:17576, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65678] Another function of VGAM1946 is therefore inhibition of Cyldromatosis (turban tumor syndrome) (CYLD, Accession NM\_015247). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLD. FLJ10925 (Accession NM\_018275) is another VGAM1946 host target gene. FLJ10925 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by FLJ10925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10925 BINDING SITE, designated SEQ ID:20261, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65679] Another function of VGAM1946 is therefore inhibition of FLJ10925 (Accession NM\_018275). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10925. FLJ11274 (Accession NM\_018375) is another VGAM1946 host target gene. FLJ11274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11274 BINDING SITE, designated SEQ ID:20400, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65680] Another function of VGAM1946 is therefore inhibition of FLJ11274 (Accession NM\_018375). Accordingly, utilities of

VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11274. KIAA0161 (Accession NM\_014746) is another VGAM1946 host target gene. KIAA0161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0161 BINDING SITE, designated SEQ ID:16435, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65681] Another function of VGAM1946 is therefore inhibition of KIAA0161 (Accession NM\_014746). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0161. MGC15438 (Accession NM\_032874) is another VGAM1946 host target gene. MGC15438 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC15438 BINDING SITE, designated SEQ ID:26694, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65682] Another function of VGAM1946 is therefore inhibition of MGC15438 (Accession NM\_032874). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15438. PRO2214 (Accession NM\_018517) is another VGAM1946 host target gene. PRO2214 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2214 BINDING SITE, designated SEQ ID:20588, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65683] Another function of VGAM1946 is therefore inhibition of PRO2214 (Accession NM\_018517). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2214. Solute Carrier Family 21 (organic anion transporter), Member 14 (SLC21A14, Accession NM\_017435) is

another VGAM1946 host target gene. SLC21A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A14 BINDING SITE, designated SEQ ID:18892, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65684] Another function of VGAM1946 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 14 (SLC21A14, Accession NM\_017435). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A14. X123 (Accession XM\_046023) is another VGAM1946 host target gene. X123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by X123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of X123 BINDING SITE, designated SEQ ID:34651, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA,

also designated SEQ ID:4657.

[65685] Another function of VGAM1946 is therefore inhibition of X123 (Accession XM\_046023). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with X123. LOC120856 (Accession XM\_058509) is another VGAM1946 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36646, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65686] Another function of VGAM1946 is therefore inhibition of LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC153339 (Accession XM\_098362) is another VGAM1946 host target gene. LOC153339 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153339, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153339 BINDING SITE, designated SEQ ID:41616, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65687] Another function of VGAM1946 is therefore inhibition of LOC153339 (Accession XM\_098362). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153339. LOC159091 (Accession NM\_138819) is another VGAM1946 host target gene. LOC159091 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159091 BINDING SITE, designated SEQ ID:29038, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65688] Another function of VGAM1946 is therefore inhibition of LOC159091 (Accession NM\_138819). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC159091. LOC255520 (Accession XM\_171073) is another VGAM1946 host target gene. LOC255520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255520 BINDING SITE, designated SEQ ID:45881, to the nucleotide sequence of VGAM1946 RNA, herein designated VGAM RNA, also designated SEQ ID:4657.

[65689] Another function of VGAM1946 is therefore inhibition of LOC255520 (Accession XM\_171073). Accordingly, utilities of VGAM1946 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255520. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1947 (VGAM1947) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65690] VGAM1947 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1947 was detected is described hereinabove with reference to Figs. 1–8.

[65691] VGAM1947 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus.

VGAM1947 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65692] VGAM1947 gene encodes a VGAM1947 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1947 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1947 precursor RNA is designated SEQ ID:1933, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1933 is located at position 16704 relative to the genome of Variola Virus.

[65693] VGAM1947 precursor RNA folds onto itself, forming VGAM1947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65694] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1947 folded precursor RNA into VGAM1947 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM1947 RNA is designated SEQ ID:4658, and is provided hereinbelow with reference to the sequence listing part.

[65695] VGAM1947 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1947 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65696] VGAM1947 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1947 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1947 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65697] The complementary binding of VGAM1947 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1947 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1947 host target RNA into VGAM1947 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65698] It is appreciated that VGAM1947 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1947 host target genes. The mRNA of each one of this plurality of VGAM1947 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1947 RNA, herein designated VGAM RNA, and which when bound by VGAM1947 RNA causes inhibition of translation of respective one or more VGAM1947 host target proteins.

[65699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1947 gene, herein designated VGAM GENE, on one or more VGAM1947 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65700] It is yet further appreciated that a function of VGAM1947 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1947 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1947 correlate with, and may be deduced from, the identity of the host target genes which VGAM1947 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65701] Nucleotide sequences of the VGAM1947 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1947 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1947 are further described hereinbelow with reference to Table 1.

[65702] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1947 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1947 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65703] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1947 gene, herein designated VGAM is inhibition of expression of VGAM1947 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1947 correlate with, and may be deduced from, the identity of the target genes which VGAM1947 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65704] Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM\_044421) is a VGAM1947 host target gene. SLC19A2 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by SLC19A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A2 BINDING SITE, designated SEQ ID:34194, to the nucleotide sequence of VGAM1947 RNA, herein designated VGAM RNA, also designated SEQ ID:4658.

[65705] A function of VGAM1947 is therefore inhibition of Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM\_044421). Accordingly, utilities of VGAM1947 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1948 (VGAM1948) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65706] VGAM1948 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1948 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[65707] VGAM1948 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Paramyxovirus 6. VGAM1948 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65708] VGAM1948 gene encodes a VGAM1948 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1948 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1948 precursor RNA is designated SEQ ID:1934, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1934 is located at position 4256 relative to the genome of Avian Paramyxovirus 6.

[65709] VGAM1948 precursor RNA folds onto itself, forming VGAM1948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65710] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1948 folded precursor RNA into VGAM1948 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1948 RNA is designated SEQ ID:4659, and is provided hereinbelow with reference to the sequence listing part.

[65711] VGAM1948 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1948 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65712] VGAM1948 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1948 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1948 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1948 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65713] The complementary binding of VGAM1948 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1948 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1948 host target RNA into VGAM1948 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65714] It is appreciated that VGAM1948 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1948 host target genes. The mRNA of each one of this plurality of VGAM1948 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1948 RNA, herein designated VGAM RNA, and which when bound by VGAM1948 RNA causes inhibition of translation of respective one or more VGAM1948 host target proteins.

[65715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1948 gene, herein designated VGAM GENE, on one or more VGAM1948 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65716] It is yet further appreciated that a function of VGAM1948 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of viral infection by Avian Paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1948 correlate with, and may be deduced from, the identity of the host target genes which VGAM1948 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65717] Nucleotide sequences of the VGAM1948 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1948 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1948 are further described hereinbelow with reference to Table 1.

[65718] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1948 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1948 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65719] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1948 gene, herein designated VGAM is inhibition of expression of VGAM1948 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1948 correlate with, and may be deduced from, the identity of the target genes which VGAM1948 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65720] ATP-binding Cassette, Sub-family G (WHITE), Member 1 (ABCG1, Accession NM\_004915) is a VGAM1948 host target gene. ABCG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCG1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCG1 BINDING SITE, designated SEQ ID:11351, to the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, also designated SEQ ID:4659.

[65721] A function of VGAM1948 is therefore inhibition of ATP-binding Cassette, Sub-family G (WHITE), Member 1 (ABCG1, Accession NM\_004915), a gene which transporter involved in macrophage lipid homeostasis. Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCG1. The function of ABCG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595.C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252) is another VGAM1948 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLECSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:14917, to the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, also designated SEQ ID:4659.

[65722] Another function of VGAM1948 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252). Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5.

2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM\_006187) is another VGAM1948 host target gene. OAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS3 BINDING SITE, designated SEQ ID:12858, to the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, also designated SEQ ID:4659.

[65723] Another function of VGAM1948 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM\_006187), a gene which may play a role in medi-

ating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS3. The function of OAS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309. Polymerase (DNA directed), Eta (POLH, Accession NM\_006502) is another VGAM1948 host target gene. POLH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLH BINDING SITE, designated SEQ ID:13249, to the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, also designated SEQ ID:4659.

[65724] Another function of VGAM1948 is therefore inhibition of Polymerase (DNA directed), Eta (POLH, Accession NM\_006502). Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLH. HSA249128 (Accession NM\_017583) is another VGAM1948 host target

gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19024, to the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, also designated SEQ ID:4659.

[65725] Another function of VGAM1948 is therefore inhibition of HSA249128 (Accession NM\_017583). Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA249128. MGC4655 (Accession NM\_033309) is another VGAM1948 host target gene. MGC4655 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4655 BINDING SITE, designated SEQ ID:27145, to the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, also designated SEQ ID:4659.

[65726] Another function of VGAM1948 is therefore inhibition of MGC4655 (Accession NM\_033309). Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4655. Transducer of ERBB2, 2 (TOB2, Accession XM\_170995) is another VGAM1948 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45763, to the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, also designated SEQ ID:4659.

[65727] Another function of VGAM1948 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM\_170995). Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. LOC90917 (Accession XM\_034861) is another VGAM1948 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32168, to the nucleotide sequence of VGAM1948 RNA, herein designated VGAM RNA, also designated SEQ ID:4659.

[65728] Another function of VGAM1948 is therefore inhibition of LOC90917 (Accession XM\_034861). Accordingly, utilities of VGAM1948 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90917. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1949 (VGAM1949) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65729] VGAM1949 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1949 was detected is described hereinabove with reference to Figs. 1-8.

[65730] VGAM1949 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Paramyxovirus 6.

VGAM1949 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65731] VGAM1949 gene encodes a VGAM1949 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1949 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1949 precursor RNA is designated SEQ ID:1935, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1935 is located at position 14249 relative to the genome of Avian Paramyxovirus 6.

[65732] VGAM1949 precursor RNA folds onto itself, forming VGAM1949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65733] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1949 folded precursor RNA into VGAM1949 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1949 RNA is designated SEQ ID:4660, and is provided hereinbelow with reference to the sequence listing part.

[65734] VGAM1949 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1949 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65735] VGAM1949 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1949 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1949 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65736] The complementary binding of VGAM1949 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1949 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1949 host target RNA into VGAM1949 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65737] It is appreciated that VGAM1949 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1949 host target genes. The mRNA of each one of this plurality of VGAM1949 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1949 RNA, herein designated VGAM RNA, and which when bound by VGAM1949 RNA causes inhibition of translation of respective one or more VGAM1949 host target proteins.

[65738] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1949 gene, herein designated VGAM GENE, on one or more VGAM1949 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65739] It is yet further appreciated that a function of VGAM1949 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1949 include diagnosis, prevention and treatment of viral infection by Avian Paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1949 correlate with, and may be deduced from, the identity of the host target genes which VGAM1949 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65740] Nucleotide sequences of the VGAM1949 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1949 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1949 are further described hereinbelow with reference to Table 1.

[65741] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1949 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1949 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65742] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1949 gene, herein designated VGAM is inhibition of expression of VGAM1949 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1949 correlate with, and may be deduced from, the identity of the target genes which VGAM1949 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65743] Keratocan (KERA, Accession NM\_007035) is a VGAM1949 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:13905, to the nucleotide sequence of VGAM1949

RNA, herein designated VGAM RNA, also designated SEQ ID:4660.

[65744] A function of VGAM1949 is therefore inhibition of Keratocan (KERA, Accession NM\_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM1949 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM723. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1950 (VGAM1950) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65745] VGAM1950 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1950 was detected is described hereinabove with reference to Figs. 1-8.

[65746] VGAM1950 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Avian Paramyxovirus 6. VGAM1950 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65747] VGAM1950 gene encodes a VGAM1950 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1950 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1950 precursor RNA is designated SEQ ID:1936, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1936 is located at position 14024 relative to the genome of Avian Paramyxovirus 6.

[65748] VGAM1950 precursor RNA folds onto itself, forming VGAM1950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65749] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1950 folded precursor RNA into VGAM1950 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1950 RNA is designated SEQ ID:4661, and is provided hereinbelow with reference to the sequence listing part.

[65750] VGAM1950 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1950 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65751] VGAM1950 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1950 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1950 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65752] The complementary binding of VGAM1950 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1950 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1950

host target RNA into VGAM1950 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65753] It is appreciated that VGAM1950 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1950 host target genes. The mRNA of each one of this plurality of VGAM1950 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1950 RNA, herein designated VGAM RNA, and which when bound by VGAM1950 RNA causes inhibition of translation of respective one or more VGAM1950 host target proteins.

[65754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1950 gene, herein designated VGAM GENE, on one or more VGAM1950 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65755] It is yet further appreciated that a function of VGAM1950 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of viral infection by Avian Paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1950 correlate with, and may be deduced from, the identity of the host target genes which VGAM1950 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65756] Nucleotide sequences of the VGAM1950 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1950 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1950 are further

described hereinbelow with reference to Table 1.

[65757] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1950 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1950 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65758] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1950 gene, herein designated VGAM is inhibition of expression of VGAM1950 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1950 correlate with, and may be deduced from, the identity of the target genes which VGAM1950 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65759] Cytochrome P450, Subfamily IVF, Polypeptide 3 (leukotriene B4 omega hydroxylase) (CYP4F3, Accession NM\_000896) is a VGAM1950 host target gene. CYP4F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP4F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of CYP4F3 BINDING SITE, designated SEQ ID:6594, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65760] A function of VGAM1950 is therefore inhibition of Cytochrome P450, Subfamily IVF, Polypeptide 3 (leukotriene B4 omega hydroxylase) (CYP4F3, Accession NM\_000896), a gene which converts leukotriene B4 into the less active 20-hydroxy-leukotriene B4. Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F3. The function of CYP4F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM186. Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950) is another VGAM1950 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:10085, to the nucleotide sequence of

VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65761] Another function of VGAM1950 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Mature T-cell Proliferation 1 (MTCP1, Accession NM\_014221) is another VGAM1950 host target gene. MTCP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MTCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCP1 BINDING SITE, designated SEQ ID:15488, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65762] Another function of VGAM1950 is therefore inhibition of Mature T-cell Proliferation 1 (MTCP1, Accession NM\_014221). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCP1. Adaptor-related Protein Complex 4, Sigma 1 Subunit (AP4S1, Accession NM\_007077) is another VGAM1950 host target gene. AP4S1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP4S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP4S1 BINDING SITE, designated SEQ ID:13941, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65763] Another function of VGAM1950 is therefore inhibition of Adaptor-related Protein Complex 4, Sigma 1 Subunit (AP4S1, Accession NM\_007077). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP4S1. Caspase Recruitment Domain Family, Member 14 (CARD14, Accession NM\_024110) is another VGAM1950

host target gene. CARD14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD14 BINDING SITE, designated SEQ ID:23556, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65764] Another function of VGAM1950 is therefore inhibition of Caspase Recruitment Domain Family, Member 14 (CARD14, Accession NM\_024110). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD14. KIAA0844 (Accession NM\_014951) is another VGAM1950 host target gene. KIAA0844 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0844 BINDING SITE, designated SEQ ID:17287, to the nucleotide sequence of VGAM1950 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4661.

[65765] Another function of VGAM1950 is therefore inhibition of KIAA0844 (Accession NM\_014951). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0844. KIAA1952 (Accession XM\_054983) is another VGAM1950 host target gene. KIAA1952 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1952 BINDING SITE, designated SEQ ID:36220, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65766] Another function of VGAM1950 is therefore inhibition of KIAA1952 (Accession XM\_054983). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1952. Lipase, Endothelial (LIPG, Accession NM\_006033) is another VGAM1950 host target gene. LIPG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIPG, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPG BINDING SITE, designated SEQ ID:12655, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65767] Another function of VGAM1950 is therefore inhibition of Lipase, Endothelial (LIPG, Accession NM\_006033). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPG. Mitochondrial Ribosomal Protein S10 (MRPS10, Accession NM\_018141) is another VGAM1950 host target gene. MRPS10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPS10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS10 BINDING SITE, designated SEQ ID:19940, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65768] Another function of VGAM1950 is therefore inhibition of Mitochondrial Ribosomal Protein S10 (MRPS10, Accession

NM\_018141). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS10. Zinc Finger Protein 297B (ZNF297B, Accession NM\_014007) is another VGAM1950 host target gene. ZNF297B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF297B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF297B BINDING SITE, designated SEQ ID:15222, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65769] Another function of VGAM1950 is therefore inhibition of Zinc Finger Protein 297B (ZNF297B, Accession NM\_014007). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF297B. LOC113523 (Accession XM\_054378) is another VGAM1950 host target gene. LOC113523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113523 BINDING SITE, designated SEQ ID:36153, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65770] Another function of VGAM1950 is therefore inhibition of LOC113523 (Accession XM\_054378). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113523. LOC145387 (Accession XM\_096791) is another VGAM1950 host target gene. LOC145387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145387 BINDING SITE, designated SEQ ID:40539, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65771] Another function of VGAM1950 is therefore inhibition of LOC145387 (Accession XM\_096791). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145387. LOC153577 (Accession XM\_098394) is another VGAM1950 host target gene. LOC153577 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153577 BINDING SITE, designated SEQ ID:41645, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65772] Another function of VGAM1950 is therefore inhibition of LOC153577 (Accession XM\_098394). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153577. LOC199733 (Accession XM\_117123) is another VGAM1950 host target gene. LOC199733 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199733 BINDING SITE, designated SEQ ID:43246, to the nucleotide sequence of VGAM1950 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4661.

[65773] Another function of VGAM1950 is therefore inhibition of LOC199733 (Accession XM\_117123). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199733. LOC221822 (Accession XM\_167268) is another VGAM1950 host target gene. LOC221822 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221822 BINDING SITE, designated SEQ ID:44624, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65774] Another function of VGAM1950 is therefore inhibition of LOC221822 (Accession XM\_167268). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221822. LOC92973 (Accession XM\_048529) is another VGAM1950 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92973, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35187, to the nucleotide sequence of VGAM1950 RNA, herein designated VGAM RNA, also designated SEQ ID:4661.

[65775] Another function of VGAM1950 is therefore inhibition of LOC92973 (Accession XM\_048529). Accordingly, utilities of VGAM1950 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1951 (VGAM1951) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65776] VGAM1951 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1951 was detected is described hereinabove with reference to Figs. 1-8.

[65777] VGAM1951 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Paramyxovirus 6.

VGAM1951 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65778] VGAM1951 gene encodes a VGAM1951 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1951 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1951 precursor RNA is designated SEQ ID:1937, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1937 is located at position 5552 relative to the genome of Avian Paramyxovirus 6.

[65779] VGAM1951 precursor RNA folds onto itself, forming VGAM1951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65780] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1951 folded precursor RNA into VGAM1951 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1951 RNA is designated SEQ ID:4662, and is provided hereinbelow with reference to the sequence listing part.

[65781] VGAM1951 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1951 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65782] VGAM1951 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1951 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1951 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65783] The complementary binding of VGAM1951 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1951 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1951 host target RNA into VGAM1951 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65784] It is appreciated that VGAM1951 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1951 host target genes. The mRNA of each one of this plurality of VGAM1951 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1951 RNA, herein designated VGAM RNA, and which when bound by VGAM1951 RNA causes inhibition of translation of respective one or more VGAM1951 host target proteins.

[65785] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1951 gene, herein designated VGAM GENE, on one or more VGAM1951 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65786] It is yet further appreciated that a function of VGAM1951 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of viral infection by Avian Paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1951 correlate with, and may be deduced from, the identity of the host target genes which VGAM1951 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65787] Nucleotide sequences of the VGAM1951 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1951 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1951 are further described hereinbelow with reference to Table 1.

[65788] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1951 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1951 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65789] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1951 gene, herein designated VGAM is inhibition of expression of VGAM1951 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1951 correlate with, and may be deduced from, the identity of the target genes which VGAM1951 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65790] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 9 (ABCB9, Accession NM\_019625) is a VGAM1951 host target gene. ABCB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB9 BINDING SITE, designated SEQ

ID:21241, to the nucleotide sequence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65791] A function of VGAM1951 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 9 (ABCB9, Accession NM\_019625), a gene which ATP binding cassette transporter B9; has transmembrane domain, nucleotide-binding domain with Walker motifs. Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB9. The function of ABCB9 has been established by previous studies. For background information on the ATP-binding cassette (ABC) family of transporter proteins, see ABCA4 (OMIM Ref. No. 601691). In addition to the 'full' ABC transporters with 2 transmembrane domains and 2 nucleotide-binding domains, there are 'half' proteins that contain only 1 of each domain (e.g., ABCB1; 171050). Full transporters are usually found in the plasma membrane, whereas half transporters are found in subcellular organelles. By searching an EST database and screening a T-lymphoblast cDNA library, Zhang et al. (2000) obtained a cDNA encoding ABCB9. Sequence analysis predicted that the 766-amino acid ABCB9 protein has

10 potential N-terminal transmembrane segments. ABCB9 shares 94% identity with the rodent sequences and is approximately 39% identical to 2 human endoplasmic reticulum half transporters, TAP1 (ABCB2; 170260) and TAP2 (ABCB3; 170261). RT-PCR and genomic sequence analysis established the existence of a splice variant with a 129-bp deletion expressed in testis and brain. Northern blot analysis detected low expression of a 3.7-kb transcript in most tissues tested, with an additional 2.2-kb transcript detected in tissues with relatively high expression, such as testis. Western blot analysis showed expression of a 72-kD nonglycosylated protein, significantly smaller than the predicted mass of 84.5 kD, that was enriched in lysosomes. Immunofluorescence microscopy demonstrated colocalization of ABCB9 with the lysosomal proteins LAMP1 (OMIM Ref. No. 153330) and LAMP2 (OMIM Ref. No. 309060). Immunohistochemical analysis detected ABCB9 expression in Sertoli cells of rodent seminiferous tubules. Allikmets et al. (1996) mapped an EST corresponding to the ABCB9 gene to 12q24.

[65792] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [65793] Allikmets, R.; Gerrard, B.; Hutchinson, A.; Dean, M. : Characterization of the human ABC superfamily: isolation and mapping of 21 new genes using the expressed sequence tags database. Hum. Molec. Genet. 5: 1649–1655, 1996. ; and
- [65794] Zhang, F.; Zhang, W.; Liu, L.; Fisher, C. L.; Hui, D.; Childs, S.; Dorovini-Zis, K.; Ling, V. : Characterization of ABCB9, an ATP binding cassette protein associated with lysosomes. J.
- [65795] Further studies establishing the function and utilities of ABCB9 are found in John Hopkins OMIM database record ID 605453, and in cited publications numbered 2822 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, alpha, converting enzyme) (ADAM17, Accession NM\_021832) is another VGAM1951 host target gene. ADAM17 BINDING SITE1 and ADAM17 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAM17, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM17 BIND-

ING SITE1 and ADAM17 BINDING SITE2, designated SEQ ID:22408 and SEQ ID:9155 respectively, to the nucleotide sequence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65796] Another function of VGAM1951 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, alpha, converting enzyme) (ADAM17, Accession NM\_021832), a gene which member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM17. The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Fucosyltransferase 9 (alpha (1,3) Fucosyltransferase) (FUT9, Accession XM\_042167) is another VGAM1951 host target gene. FUT9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT9 BINDING SITE, designated SEQ ID:33698, to the nucleotide se-

quence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65797] Another function of VGAM1951 is therefore inhibition of Fucosyltransferase 9 (alpha (1,3) Fucosyltransferase) (FUT9, Accession XM\_042167), a gene which catalyzes alpha-1,3 glycosidic linkages. Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT9. The function of FUT9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Chromosome 20 Open Reading Frame 126 (C20orf126, Accession NM\_030815) is another VGAM1951 host target gene. C20orf126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf126 BINDING SITE, designated SEQ ID:25135, to the nucleotide sequence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65798] Another function of VGAM1951 is therefore inhibition of

Chromosome 20 Open Reading Frame 126 (C20orf126, Accession NM\_030815). Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf126. Chloride Intracellular Channel 5 (CLIC5, Accession NM\_016929) is another VGAM1951 host target gene. CLIC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLIC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC5 BINDING SITE, designated SEQ ID:18846, to the nucleotide sequence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65799] Another function of VGAM1951 is therefore inhibition of Chloride Intracellular Channel 5 (CLIC5, Accession NM\_016929). Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC5. FLJ31890 (Accession XM\_166117) is another VGAM1951 host target gene. FLJ31890 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31890, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31890 BINDING SITE, designated SEQ ID:43894, to the nucleotide sequence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65800] Another function of VGAM1951 is therefore inhibition of FLJ31890 (Accession XM\_166117). Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31890. KIAA0365 (Accession XM\_086055) is another VGAM1951 host target gene. KIAA0365 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0365, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0365 BINDING SITE, designated SEQ ID:38470, to the nucleotide sequence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65801] Another function of VGAM1951 is therefore inhibition of KIAA0365 (Accession XM\_086055). Accordingly, utilities of VGAM1951 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0365. PR Domain Containing 13 (PRDM13, Accession NM\_021620) is another VGAM1951 host target gene. PRDM13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM13 BINDING SITE, designated SEQ ID:22256, to the nucleotide sequence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65802] Another function of VGAM1951 is therefore inhibition of PR Domain Containing 13 (PRDM13, Accession NM\_021620). Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM13. LOC143308 (Accession XM\_096411) is another VGAM1951 host target gene. LOC143308 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC143308 BINDING SITE, designated SEQ ID:40347, to the nucleotide sequence of VGAM1951 RNA, herein designated VGAM RNA, also designated SEQ ID:4662.

[65803] Another function of VGAM1951 is therefore inhibition of LOC143308 (Accession XM\_096411). Accordingly, utilities of VGAM1951 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143308. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1952 (VGAM1952) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65804] VGAM1952 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1952 was detected is described hereinabove with reference to Figs. 1–8.

[65805] VGAM1952 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Paramyxovirus 6. VGAM1952 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[65806] VGAM1952 gene encodes a VGAM1952 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1952 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1952 precursor RNA is designated SEQ ID:1938, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1938 is located at position 12992 relative to the genome of Avian Paramyxovirus 6.

[65807] VGAM1952 precursor RNA folds onto itself, forming VGAM1952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65808] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1952 folded precursor RNA into VGAM1952 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1952 RNA is designated SEQ ID:4663, and is provided hereinbelow with reference to the sequence listing part.

[65809] VGAM1952 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1952 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65810] VGAM1952 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1952 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1952 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65811] The complementary binding of VGAM1952 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1952 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1952 host target RNA into VGAM1952 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65812] It is appreciated that VGAM1952 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1952 host target genes. The mRNA of each one of this plurality of VGAM1952 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1952 RNA, herein designated VGAM RNA, and which when bound by VGAM1952 RNA causes inhibition of translation of respective one or more VGAM1952 host target proteins.

[65813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1952 gene, herein designated VGAM GENE, on one or more VGAM1952 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65814] It is yet further appreciated that a function of VGAM1952 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of viral infection by Avian Paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1952 correlate with, and may be deduced from, the identity of the host target genes which VGAM1952 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65815] Nucleotide sequences of the VGAM1952 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1952 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1952 are further described hereinbelow with reference to Table 1.

[65816] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1952 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1952 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65817] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1952 gene, herein designated VGAM is inhibition of expression of VGAM1952 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1952 correlate with, and may be deduced from, the identity of the target genes which VGAM1952 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65818] Cytochrome P450, Subfamily VIIA (cholesterol 7 alpha-monooxygenase), Polypeptide 1 (CYP7A1, Accession NM\_000780) is a VGAM1952 host target gene. CYP7A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP7A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP7A1 BINDING SITE, designated SEQ ID:6422, to the nucleotide sequence of VGAM1952 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4663.

[65819] A function of VGAM1952 is therefore inhibition of Cytochrome P450, Subfamily VIIA (cholesterol 7 alpha-monooxygenase), Polypeptide 1 (CYP7A1, Accession NM\_000780), a gene which functions in cholesterol and bile acid metabolism . Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP7A1. The function of CYP7A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM414.F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM\_012300) is another VGAM1952 host target gene. FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXW1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3, designated SEQ ID:14661, SEQ ID:27363 and SEQ ID:27373 respectively, to the nucleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, also designated SEQ

ID:4663.

[65820] Another function of VGAM1952 is therefore inhibition of F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM\_012300), a gene which somehow is involved in the process of neuronal cell differentiation or brain development. Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW1B. The function of FBXW1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM\_002223) is another VGAM1952 host target gene. ITPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:7991, to the nucleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, also designated SEQ ID:4663.

[65821] Another function of VGAM1952 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Ac-

cession NM\_002223). Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. FLJ10508 (Accession NM\_018118) is another VGAM1952 host target gene. FLJ10508 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10508 BINDING SITE, designated SEQ ID:19890, to the nucleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, also designated SEQ ID:4663.

[65822] Another function of VGAM1952 is therefore inhibition of FLJ10508 (Accession NM\_018118). Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10508. FLJ13110 (Accession NM\_022912) is another VGAM1952 host target gene. FLJ13110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ13110 BINDING SITE, designated SEQ ID:23221, to the nucleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, also designated SEQ ID:4663.

[65823] Another function of VGAM1952 is therefore inhibition of FLJ13110 (Accession NM\_022912). Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13110. Interleukin 17D (IL17D, Accession NM\_138284) is another VGAM1952 host target gene. IL17D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL17D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL17D BINDING SITE, designated SEQ ID:28701, to the nucleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, also designated SEQ ID:4663.

[65824] Another function of VGAM1952 is therefore inhibition of Interleukin 17D (IL17D, Accession NM\_138284). Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL17D. KIAA1600 (Accession XM\_049351) is an-

other VGAM1952 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:35393, to the nucleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, also designated SEQ ID:4663.

[65825] Another function of VGAM1952 is therefore inhibition of KIAA1600 (Accession XM\_049351). Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. Target of Myb1-like 1 (chicken) (TOM1L1, Accession NM\_005486) is another VGAM1952 host target gene. TOM1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOM1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOM1L1 BINDING SITE, designated SEQ ID:11983, to the nucleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, also designated SEQ

ID:4663.

[65826] Another function of VGAM1952 is therefore inhibition of Target of Myb1-like 1 (chicken) (TOM1L1, Accession NM\_005486). Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOM1L1. LOC221143 (Accession XM\_167986) is another VGAM1952 host target gene. LOC221143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221143 BINDING SITE, designated SEQ ID:44941, to the nucleotide sequence of VGAM1952 RNA, herein designated VGAM RNA, also designated SEQ ID:4663.

[65827] Another function of VGAM1952 is therefore inhibition of LOC221143 (Accession XM\_167986). Accordingly, utilities of VGAM1952 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221143. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1953 (VGAM1953) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65828] VGAM1953 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1953 was detected is described hereinabove with reference to Figs. 1–8.

[65829] VGAM1953 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Paramyxovirus 6. VGAM1953 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65830] VGAM1953 gene encodes a VGAM1953 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1953 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1953 precursor RNA is designated SEQ ID:1939, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1939 is located at position 3760 relative to the genome of Avian Paramyxovirus 6.

[65831] VGAM1953 precursor RNA folds onto itself, forming VGAM1953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65832] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1953 folded precursor RNA into VGAM1953 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1953 RNA is designated SEQ ID:4664, and is provided hereinbelow with reference to the sequence listing part.

[65833] VGAM1953 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1953 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1953 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[65834] VGAM1953 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1953 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1953 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1953 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1953 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65835] The complementary binding of VGAM1953 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1953 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1953 host target RNA into VGAM1953 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65836] It is appreciated that VGAM1953 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1953 host target genes. The mRNA of each one of this plurality of VGAM1953 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1953 RNA, herein designated VGAM RNA, and which when bound by VGAM1953 RNA causes inhibition of translation of respective one or more VGAM1953 host target proteins.

[65837] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1953 gene, herein designated VGAM GENE, on one or more VGAM1953 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65838] It is yet further appreciated that a function of VGAM1953 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1953 include diagnosis, prevention and treatment of viral infection by Avian Paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1953 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1953 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65839] Nucleotide sequences of the VGAM1953 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1953 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1953 are further described hereinbelow with reference to Table 1.

[65840] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1953 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1953 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65841] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1953 gene, herein designated VGAM is inhibition of expression of VGAM1953 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1953 correlate with, and may be deduced from, the identity of the target genes which VGAM1953

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65842] Glucose-6-phosphate Dehydrogenase (G6PD, Accession NM\_000402) is a VGAM1953 host target gene. G6PD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by G6PD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PD BINDING SITE, designated SEQ ID:5978, to the nucleotide sequence of VGAM1953 RNA, herein designated VGAM RNA, also designated SEQ ID:4664.

[65843] A function of VGAM1953 is therefore inhibition of Glucose-6-phosphate Dehydrogenase (G6PD, Accession NM\_000402), a gene which produces pentose sugars for nucleic acid synthesis and main producer of nadph reducing power. Accordingly, utilities of VGAM1953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PD. The function of G6PD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1027.PR Domain Containing 2, with ZNF Domain (PRDM2, Accession

NM\_012231) is another VGAM1953 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:14531, to the nucleotide sequence of VGAM1953 RNA, herein designated VGAM RNA, also designated SEQ ID:4664.

[65844] Another function of VGAM1953 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_012231), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM1953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.FLJ20257 (Accession NM\_019606) is another VGAM1953 host target gene. FLJ20257 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ20257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20257 BINDING SITE, designated SEQ ID:21221, to the nucleotide sequence of VGAM1953 RNA, herein designated VGAM RNA, also designated SEQ ID:4664.

[65845] Another function of VGAM1953 is therefore inhibition of FLJ20257 (Accession NM\_019606). Accordingly, utilities of VGAM1953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20257. KIAA1030 (Accession XM\_167789) is another VGAM1953 host target gene. KIAA1030 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1030, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1030 BINDING SITE, designated SEQ ID:44818, to the nucleotide sequence of VGAM1953 RNA, herein designated VGAM RNA, also designated SEQ ID:4664.

[65846] Another function of VGAM1953 is therefore inhibition of KIAA1030 (Accession XM\_167789). Accordingly, utilities

of VGAM1953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1030. Phosphodiesterase 8A (PDE8A, Accession XM\_031443) is another VGAM1953 host target gene. PDE8A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE8A BINDING SITE, designated SEQ ID:31379, to the nucleotide sequence of VGAM1953 RNA, herein designated VGAM RNA, also designated SEQ ID:4664.

[65847] Another function of VGAM1953 is therefore inhibition of Phosphodiesterase 8A (PDE8A, Accession XM\_031443). Accordingly, utilities of VGAM1953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE8A. Paternally Expressed 10 (PEG10, Accession NM\_015068) is another VGAM1953 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17428, to the nucleotide sequence of VGAM1953 RNA, herein designated VGAM RNA, also designated SEQ ID:4664.

[65848] Another function of VGAM1953 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM\_015068). Accordingly, utilities of VGAM1953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. LOC204084 (Accession XM\_115181) is another VGAM1953 host target gene. LOC204084 BINDING SITE1 and LOC204084 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC204084, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204084 BINDING SITE1 and LOC204084 BINDING SITE2, designated SEQ ID:43088 and SEQ ID:43087 respectively, to the nucleotide sequence of VGAM1953 RNA, herein designated VGAM RNA, also designated SEQ ID:4664.

[65849] Another function of VGAM1953 is therefore inhibition of

LOC204084 (Accession XM\_115181). Accordingly, utilities of VGAM1953 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204084. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1954 (VGAM1954) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65850] VGAM1954 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1954 was detected is described hereinabove with reference to Figs. 1-8.

[65851] VGAM1954 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Paramyxovirus 6. VGAM1954 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65852] VGAM1954 gene encodes a VGAM1954 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1954 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1954 precursor RNA is designated SEQ ID:1940, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1940 is located at position 6741 relative to the genome of Avian Paramyxovirus 6.

- [65853] VGAM1954 precursor RNA folds onto itself, forming VGAM1954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [65854] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1954 folded precursor RNA into VGAM1954 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide se-

quence of VGAM1954 RNA is designated SEQ ID:4665, and is provided hereinbelow with reference to the sequence listing part.

[65855] VGAM1954 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1954 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65856] VGAM1954 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1954 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1954 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[65857] The complementary binding of VGAM1954 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1954 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1954 host target RNA into VGAM1954 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65858] It is appreciated that VGAM1954 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1954 host target genes. The mRNA of each one of this plurality of VGAM1954 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1954 RNA, herein designated VGAM RNA, and which when bound by VGAM1954 RNA causes inhibition of translation of respective one or more VGAM1954 host target proteins.

[65859] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1954 gene, herein designated VGAM GENE, on one or more VGAM1954 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65860] It is yet further appreciated that a function of VGAM1954

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1954 include diagnosis, prevention and treatment of viral infection by Avian Paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM1954 correlate with, and may be deduced from, the identity of the host target genes which VGAM1954 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65861] Nucleotide sequences of the VGAM1954 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1954 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1954 are further described hereinbelow with reference to Table 1.

[65862] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1954 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1954 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65863] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1954 gene, herein designated VGAM is inhibition of expression of VGAM1954 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1954 correlate with, and may be deduced from, the identity of the target genes which VGAM1954 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65864] COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM\_004376) is a VGAM1954 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:10599, to the nucleotide sequence of VGAM1954 RNA, herein designated VGAM RNA, also designated SEQ ID:4665.

[65865] A function of VGAM1954 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM\_004376). Accordingly, utilities of VGAM1954 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with COX15. Tumor Necrosis Factor Receptor Superfamily, Member 9 (TNFRSF9, Accession NM\_001561) is another VGAM1954 host target gene. TNFRSF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF9 BINDING SITE, designated SEQ ID:7287, to the nucleotide sequence of VGAM1954 RNA, herein designated VGAM RNA, also designated SEQ ID:4665.

[65866] Another function of VGAM1954 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 9 (TNFRSF9, Accession NM\_001561), a gene which inhibits proliferation of activated T lymphocytes. Accordingly, utilities of VGAM1954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF9. The function of TNFRSF9 has been established by previous studies. Schwarz et al. (1996) reported that ILA inhibits proliferation of activated T lymphocytes and induces programmed cell death. Loo et al. (1997) reported that, unlike its mouse counterpart, human 4-1BB

binds only to its ligand, TNFSF9, and not to extracellular matrix proteins such as laminin (see OMIM Ref. No. 150240). The authors attributed this species distinction to sequence differences in the N-terminal laminin-homologous domain of human 4-1BB.

[65867] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[65868] Loo, D. T.; Chalupny, N. J.; Bajorath, J.; Shuford, W. W.; Mittler, R. S.; Aruffo, A. : Analysis of 4-1BBL and laminin binding to murine 4-1BB, a member of the tumor necrosis factor receptor superfamily, and comparison with human 4-1BB. J. Biol. Chem. 272: 6448-6456, 1997. ; and

[65869] Schwarz, H.; Arden, K.; Lotz, M. : CD137, a member of the tumor necrosis factor receptor family, is located on chromosome 1p36, in a cluster of related genes, and colocalizes with sever.

[65870] Further studies establishing the function and utilities of TNFRSF9 are found in John Hopkins OMIM database record ID 602250, and in cited publications numbered 6205-6210 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.

Chromosome 20 Open Reading Frame 121

(C20orf121, Accession NM\_024331) is another VGAM1954 host target gene. C20orf121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23627, to the nucleotide sequence of VGAM1954 RNA, herein designated VGAM RNA, also designated SEQ ID:4665.

[65871] Another function of VGAM1954 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331). Accordingly, utilities of VGAM1954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. Ligand of Numb-protein X (LNX, Accession NM\_032622) is another VGAM1954 host target gene. LNX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LNX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNX BINDING SITE, designated SEQ ID:26337, to the nu-

cleotide sequence of VGAM1954 RNA, herein designated VGAM RNA, also designated SEQ ID:4665.

[65872] Another function of VGAM1954 is therefore inhibition of Ligand of Numb–protein X (LNX, Accession NM\_032622). Accordingly, utilities of VGAM1954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNX. LOC202181 (Accession XM\_114456) is another VGAM1954 host target gene. LOC202181 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202181 BINDING SITE, designated SEQ ID:42967, to the nucleotide sequence of VGAM1954 RNA, herein designated VGAM RNA, also designated SEQ ID:4665.

[65873] Another function of VGAM1954 is therefore inhibition of LOC202181 (Accession XM\_114456). Accordingly, utilities of VGAM1954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202181. LOC93206 (Accession XM\_049838) is another VGAM1954 host target gene. LOC93206 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93206 BINDING SITE, designated SEQ ID:35515, to the nucleotide sequence of VGAM1954 RNA, herein designated VGAM RNA, also designated SEQ ID:4665.

[65874] Another function of VGAM1954 is therefore inhibition of LOC93206 (Accession XM\_049838). Accordingly, utilities of VGAM1954 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93206. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1955 (VGAM1955) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65875] VGAM1955 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1955 was detected is described hereinabove with reference to Figs. 1–8.

[65876] VGAM1955 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1955 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65877] VGAM1955 gene encodes a VGAM1955 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1955 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1955 precursor RNA is designated SEQ ID:1941, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1941 is located at position 6373 relative to the genome of Macaca Mulatta Rhadinovirus.

[65878] VGAM1955 precursor RNA folds onto itself, forming VGAM1955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[65879] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1955 folded precursor RNA into VGAM1955 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1955 RNA is designated SEQ ID:4666, and is provided hereinbelow with reference to the sequence listing part.

[65880] VGAM1955 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1955 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1955 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65881] VGAM1955 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1955 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1955 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1955 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1955 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65882] The complementary binding of VGAM1955 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1955 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1955 host target RNA into VGAM1955 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65883] It is appreciated that VGAM1955 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1955 host target genes. The mRNA of each one of this plurality of VGAM1955 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1955 RNA, herein designated VGAM RNA, and which when bound by VGAM1955 RNA causes inhibition of translation of respective one or more VGAM1955 host target proteins.

[65884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1955 gene, herein designated VGAM GENE, on one or more VGAM1955 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65885] It is yet further appreciated that a function of VGAM1955 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1955 correlate with, and may be deduced from, the identity of the host target genes which VGAM1955 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65886] Nucleotide sequences of the VGAM1955 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1955 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1955 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1955 are further described hereinbelow with reference to Table 1.

[65887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1955 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1955 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65888] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1955 gene, herein designated VGAM is inhibition of expression of VGAM1955 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1955 correlate with, and may be deduced from, the identity of the target genes which VGAM1955 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65889] Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_000489) is a VGAM1955 host target gene. ATRX BINDING SITE1 and ATRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATRX, corresponding to HOST TARGET binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRX BINDING SITE1 and ATRX BINDING SITE2, designated SEQ ID:6098 and SEQ ID:28687 respectively, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65890] A function of VGAM1955 is therefore inhibition of Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_000489). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRX. Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493) is another VGAM1955 host target gene. CLN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN5 BINDING SITE, designated SEQ ID:13231, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65891] Another function of VGAM1955 is therefore inhibition of Ceroid–lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN5. Calponin 2 (CNN2, Accession NM\_004368) is another VGAM1955 host target gene. CNN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNN2 BINDING SITE, designated SEQ ID:10583, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65892] Another function of VGAM1955 is therefore inhibition of Calponin 2 (CNN2, Accession NM\_004368), a gene which may be involved in the structural organization and/or anchorage of actin filaments. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNN2. The function of CNN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM1498.Chondroitin Sulfate Proteoglycan 3 (neurocan) (CSPG3, Accession NM\_004386) is another VGAM1955 host target gene. CSPG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSPG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSPG3 BINDING SITE, designated SEQ ID:10616, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65893] Another function of VGAM1955 is therefore inhibition of Chondroitin Sulfate Proteoglycan 3 (neurocan) (CSPG3, Accession NM\_004386), a gene which may play a role in modulating cell adhesion and migration. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSPG3. The function of CSPG3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM634.DMC1 Dosage Suppressor of Mck1 Homolog, Meiosis-specific Homologous Recombination (yeast) (DMC1, Accession NM\_007068) is another

VGAM1955 host target gene. DMC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMC1 BINDING SITE, designated SEQ ID:13934, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65894] Another function of VGAM1955 is therefore inhibition of DMC1 Dosage Suppressor of Mck1 Homolog, Meiosis-specific Homologous Recombination (yeast) (DMC1, Accession NM\_007068). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMC1. DnaJ (Hsp40) Homolog, Subfamily B, Member 9 (DNAJB9, Accession NM\_012328) is another VGAM1955 host target gene. DNAJB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJB9 BINDING SITE, designated SEQ

ID:14719, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65895] Another function of VGAM1955 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily B, Member 9 (DNAJB9, Accession NM\_012328). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB9. Dual Specificity Phosphatase 6 (DUSP6, Accession XM\_038308) is another VGAM1955 host target gene. DUSP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP6 BINDING SITE, designated SEQ ID:32809, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65896] Another function of VGAM1955 is therefore inhibition of Dual Specificity Phosphatase 6 (DUSP6, Accession XM\_038308), a gene which inactivates map kinases. Accordingly, utilities of VGAM1955 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with DUSP6. The function of DUSP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1763.DXS1283E

(Accession XM\_047871) is another VGAM1955 host target gene. DXS1283E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXS1283E BINDING SITE, designated SEQ ID:35063, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65897] Another function of VGAM1955 is therefore inhibition of DXS1283E (Accession XM\_047871). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXS1283E. F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM\_012300) is another VGAM1955 host target gene. FBXW1B BINDING SITE1 through FBXW1B BINDING SITE6 are HOST TARGET binding sites found in

untranslated regions of mRNA encoded by FBXW1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE1 through FBXW1B BINDING SITE6, designated SEQ ID:14665, SEQ ID:27381, SEQ ID:27377, SEQ ID:14669, SEQ ID:27367 and SEQ ID:27371 respectively, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65898] Another function of VGAM1955 is therefore inhibition of F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM\_012300), a gene which somehow is involved in the process of neuronal cell differentiation or brain development. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW1B. The function of FBXW1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Glyoxalase I (GLO1, Accession NM\_006708) is another VGAM1955 host target gene. GLO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by GLO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLO1 BINDING SITE, designated SEQ ID:13529, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65899] Another function of VGAM1955 is therefore inhibition of Glyoxalase I (GLO1, Accession NM\_006708), a gene which converts methylglyoxal and glutathione to S-lactoylglutathione. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLO1. The function of GLO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786. Insulin Receptor Substrate 2 (IRS2, Accession XM\_007095) is another VGAM1955 host target gene. IRS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS2 BINDING

SITE, designated SEQ ID:30032, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65900] Another function of VGAM1955 is therefore inhibition of Insulin Receptor Substrate 2 (IRS2, Accession XM\_007095), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS2. The function of IRS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1217. Junctional Adhesion Molecule 3 (JAM3, Accession NM\_032801) is another VGAM1955 host target gene. JAM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM3 BINDING SITE, designated SEQ ID:26554, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65901] Another function of VGAM1955 is therefore inhibition of

Junctional Adhesion Molecule 3 (JAM3, Accession NM\_032801), a gene which is a member of the junctional adhesion molecule protein family. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM3. The function of JAM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM\_004631) is another VGAM1955 host target gene. LRP8 BINDING SITE1 and LRP8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LRP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP8 BINDING SITE1 and LRP8 BINDING SITE2, designated SEQ ID:11007 and SEQ ID:27131 respectively, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65902] Another function of VGAM1955 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 8,

Apolipoprotein E Receptor (LRP8, Accession NM\_004631), a gene which binds vldl and transports it into cells by endocytosis. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP8. The function of LRP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM\_046129) is another VGAM1955 host target gene. NEDD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4 BINDING SITE, designated SEQ ID:34694, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65903] Another function of VGAM1955 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM\_046129), a gene which ubiquitinates regulatory proteins involved in transcription.

Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD4. The function of NEDD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209. Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005) is another VGAM1955 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:15217, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65904] Another function of VGAM1955 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Polycystic Kidney Disease (polycystin) and REJ (sperm receptor for egg jelly homolog, sea urchin)-like (PKDREJ, Accession NM\_006071) is another VGAM1955 host target gene. PKDREJ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKDREJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKDREJ BINDING SITE, designated SEQ ID:12716, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65905] Another function of VGAM1955 is therefore inhibition of Polycystic Kidney Disease (polycystin) and REJ (sperm receptor for egg jelly homolog, sea urchin)-like (PKDREJ, Accession NM\_006071), a gene which may intervene in fertilization. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKDREJ. The function of PKDREJ and its association with various diseases and clinical

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM641. Prion Protein (p27–30) (Creutzfeld–Jakob disease, Gerstmann–Strausler–Scheinker syndrome, fatal familial insomnia) (PRNP, Accession NM\_000311) is another VGAM1955 host target gene. PRNP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRNP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRNP BINDING SITE, designated SEQ ID:5848, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65906] Another function of VGAM1955 is therefore inhibition of Prion Protein (p27–30) (Creutzfeld–Jakob disease, Gerstmann–Strausler–Scheinker syndrome, fatal familial insomnia) (PRNP, Accession NM\_000311), a gene which the function of prp is not known. prp is encoded in the host genome and is expressed both in normal and infected cells. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRNP. The function of PRNP and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM669.RAB1A, Member RAS Oncogene Family (RAB1A, Accession XM\_046674) is another VGAM1955 host target gene. RAB1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB1A BINDING SITE, designated SEQ ID:34788, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65907] Another function of VGAM1955 is therefore inhibition of RAB1A, Member RAS Oncogene Family (RAB1A, Accession XM\_046674), a gene which is involved in vesicle transport. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB1A. The function of RAB1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.RNA (guanine-7-) Methyltransferase (RNMT, Accession

NM\_003799) is another VGAM1955 host target gene.

RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9894, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65908] Another function of VGAM1955 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.RNTRE (Accession NM\_014688) is another VGAM1955 host target gene. RNTRE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNTRE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNTRE BINDING SITE, designated SEQ ID:16191, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65909] Another function of VGAM1955 is therefore inhibition of RNTRE (Accession NM\_014688), a gene which may be involved in cell proliferation. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNTRE. The function of RNTRE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379.Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM\_003615) is another VGAM1955 host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:9675, to the nucleotide sequence of VGAM1955 RNA,

herein designated VGAM RNA, also designated SEQ ID:4666.

[65910] Another function of VGAM1955 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM\_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM66. Sclerosteosis (SOST, Accession NM\_025237) is another VGAM1955 host target gene. SOST BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOST BINDING SITE, designated SEQ ID:24919, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65911] Another function of VGAM1955 is therefore inhibition of Sclerosteosis (SOST, Accession NM\_025237). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOST. TAP Binding Protein (tapasin) (TAPBP, Accession NM\_003190) is another VGAM1955 host target gene. TAPBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9185, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65912] Another function of VGAM1955 is therefore inhibition of TAP Binding Protein (tapasin) (TAPBP, Accession NM\_003190), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP. The function of TAPBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM122.TOX (Accession NM\_014729) is another VGAM1955 host target gene. TOX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOX BINDING SITE, designated SEQ ID:16326, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65913] Another function of VGAM1955 is therefore inhibition of TOX (Accession NM\_014729). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOX. 5T4 (Accession NM\_006670) is another VGAM1955 host target gene. 5T4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by 5T4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 5T4 BINDING SITE, designated SEQ ID:13486, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ

ID:4666.

[65914] Another function of VGAM1955 is therefore inhibition of 5T4 (Accession NM\_006670). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 5T4. Abhydrolase Domain Containing 3 (ABHD3, Accession NM\_138340) is another VGAM1955 host target gene. ABHD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABHD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABHD3 BINDING SITE, designated SEQ ID:28741, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65915] Another function of VGAM1955 is therefore inhibition of Abhydrolase Domain Containing 3 (ABHD3, Accession NM\_138340). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABHD3. Acetyl-Coenzyme A Synthetase 2 (AMP forming)-like (ACAS2L, Accession XM\_042770) is another VGAM1955 host target gene.

ACAS2L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACAS2L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACAS2L BINDING SITE, designated SEQ ID:33767, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65916] Another function of VGAM1955 is therefore inhibition of Acetyl-Coenzyme A Synthetase 2 (AMP forming)-like (ACAS2L, Accession XM\_042770). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACAS2L. Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM\_085082) is another VGAM1955 host target gene. ARHGAP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP5 BINDING SITE, designated SEQ ID:37819, to the nucleotide sequence of VGAM1955

RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65917] Another function of VGAM1955 is therefore inhibition of Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM\_085082). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP5. BM046 (Accession NM\_018460) is another VGAM1955 host target gene. BM046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BM046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM046 BINDING SITE, designated SEQ ID:20532, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65918] Another function of VGAM1955 is therefore inhibition of BM046 (Accession NM\_018460). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM046. BPES (Accession NM\_023067) is another VGAM1955 host target gene. BPES BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by BPES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPES BINDING SITE, designated SEQ ID:23324, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65919] Another function of VGAM1955 is therefore inhibition of BPES (Accession NM\_023067). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPES. DJ473B4 (Accession NM\_019556) is another VGAM1955 host target gene. DJ473B4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DJ473B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ473B4 BINDING SITE, designated SEQ ID:21212, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65920] Another function of VGAM1955 is therefore inhibition of

DJ473B4 (Accession NM\_019556). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ473B4. DJ971N18.2 (Accession NM\_021156) is another VGAM1955 host target gene. DJ971N18.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ971N18.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ971N18.2 BINDING SITE, designated SEQ ID:22136, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65921] Another function of VGAM1955 is therefore inhibition of DJ971N18.2 (Accession NM\_021156). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ971N18.2. DKFZP434E2318 (Accession NM\_032138) is another VGAM1955 host target gene. DKFZP434E2318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434E2318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2318 BINDING SITE, designated SEQ ID:25818, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65922] Another function of VGAM1955 is therefore inhibition of DKFZP434E2318 (Accession NM\_032138). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2318. DKFZP434I1735 (Accession XM\_113763) is another VGAM1955 host target gene. DKFZP434I1735 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434I1735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I1735 BINDING SITE, designated SEQ ID:42423, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65923] Another function of VGAM1955 is therefore inhibition of DKFZP434I1735 (Accession XM\_113763). Accordingly, utilities of VGAM1955 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434I1735. DKFZP434P0721 (Accession XM\_033181) is another VGAM1955 host target gene. DKFZP434P0721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:31870, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65924] Another function of VGAM1955 is therefore inhibition of DKFZP434P0721 (Accession XM\_033181). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. DKFZP586M0622 (Accession NM\_015583) is another VGAM1955 host target gene. DKFZP586M0622 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP586M0622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZP586M0622 BINDING SITE, designated SEQ ID:17848, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65925] Another function of VGAM1955 is therefore inhibition of DKFZP586M0622 (Accession NM\_015583). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M0622. EFA6R (Accession NM\_015310) is another VGAM1955 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17629, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65926] Another function of VGAM1955 is therefore inhibition of EFA6R (Accession NM\_015310). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. ERp44 (Accession XM\_088476) is another VGAM1955 host

target gene. ERp44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERp44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERp44 BINDING SITE, designated SEQ ID:39727, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65927] Another function of VGAM1955 is therefore inhibition of ERp44 (Accession XM\_088476). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERp44. Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM\_057927) is another VGAM1955 host target gene. FHOD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FHOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHOD2 BINDING SITE, designated SEQ ID:36555, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ

ID:4666.

[65928] Another function of VGAM1955 is therefore inhibition of Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM\_057927). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHOD2. FLJ10008 (Accession NM\_017970) is another VGAM1955 host target gene. FLJ10008 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10008 BINDING SITE, designated SEQ ID:19693, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65929] Another function of VGAM1955 is therefore inhibition of FLJ10008 (Accession NM\_017970). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10008. FLJ12587 (Accession NM\_022480) is another VGAM1955 host target gene. FLJ12587 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ12587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12587 BINDING SITE, designated SEQ ID:22850, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65930] Another function of VGAM1955 is therefore inhibition of FLJ12587 (Accession NM\_022480). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12587. FLJ13340 (Accession NM\_057175) is another VGAM1955 host target gene. FLJ13340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13340 BINDING SITE, designated SEQ ID:27705, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65931] Another function of VGAM1955 is therefore inhibition of FLJ13340 (Accession NM\_057175). Accordingly, utilities of

VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13340. FLJ20276 (Accession NM\_017738) is another VGAM1955 host target gene. FLJ20276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20276 BINDING SITE, designated SEQ ID:19328, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65932] Another function of VGAM1955 is therefore inhibition of FLJ20276 (Accession NM\_017738). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20276. FLJ20294 (Accession NM\_017749) is another VGAM1955 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294

BINDING SITE, designated SEQ ID:19346, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65933] Another function of VGAM1955 is therefore inhibition of FLJ20294 (Accession NM\_017749). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. GT650 (Accession NM\_052851) is another VGAM1955 host target gene. GT650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GT650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GT650 BINDING SITE, designated SEQ ID:27435, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65934] Another function of VGAM1955 is therefore inhibition of GT650 (Accession NM\_052851). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GT650. KIAA0447 (Accession XM\_049733) is another VGAM1955 host target gene. KIAA0447 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:35496, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65935] Another function of VGAM1955 is therefore inhibition of KIAA0447 (Accession XM\_049733). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447. KIAA0753 (Accession NM\_014804) is another VGAM1955 host target gene. KIAA0753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0753 BINDING SITE, designated SEQ ID:16738, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65936] Another function of VGAM1955 is therefore inhibition of

KIAA0753 (Accession NM\_014804). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0753. KIAA0820 (Accession XM\_044463) is another VGAM1955 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34223, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65937] Another function of VGAM1955 is therefore inhibition of KIAA0820 (Accession XM\_044463). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. KIAA0836 (Accession XM\_035390) is another VGAM1955 host target gene. KIAA0836 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0836 BINDING SITE, designated SEQ ID:32246, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65938] Another function of VGAM1955 is therefore inhibition of KIAA0836 (Accession XM\_035390). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0836. KIAA1005 (Accession XM\_051197) is another VGAM1955 host target gene. KIAA1005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1005 BINDING SITE, designated SEQ ID:35780, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65939] Another function of VGAM1955 is therefore inhibition of KIAA1005 (Accession XM\_051197). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1005. KIAA1041 (Accession NM\_014947) is another

VGAM1955 host target gene. KIAA1041 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:17268, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65940] Another function of VGAM1955 is therefore inhibition of KIAA1041 (Accession NM\_014947). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041. KIAA1468 (Accession XM\_166289) is another VGAM1955 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:44101, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65941] Another function of VGAM1955 is therefore inhibition of KIAA1468 (Accession XM\_166289). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1468. KIAA1546 (Accession XM\_042301) is another VGAM1955 host target gene. KIAA1546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1546 BINDING SITE, designated SEQ ID:33714, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65942] Another function of VGAM1955 is therefore inhibition of KIAA1546 (Accession XM\_042301). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1546. KIAA1727 (Accession XM\_034262) is another VGAM1955 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32039, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65943] Another function of VGAM1955 is therefore inhibition of KIAA1727 (Accession XM\_034262). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. KIAA1764 (Accession XM\_045086) is another VGAM1955 host target gene. KIAA1764 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1764 BINDING SITE, designated SEQ ID:34355, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65944] Another function of VGAM1955 is therefore inhibition of KIAA1764 (Accession XM\_045086). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1764. KIAA1765 (Accession XM\_047355) is another VGAM1955 host target gene. KIAA1765 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1765 BINDING SITE, designated SEQ ID:34958, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65945] Another function of VGAM1955 is therefore inhibition of KIAA1765 (Accession XM\_047355). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1765. Kelch-like 8 (Drosophila) (KLHL8, Accession XM\_031735) is another VGAM1955 host target gene. KLHL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL8 BINDING SITE, designated SEQ ID:31477, to the nucleotide sequence of VGAM1955 RNA,

herein designated VGAM RNA, also designated SEQ ID:4666.

[65946] Another function of VGAM1955 is therefore inhibition of Kelch-like 8 (Drosophila) (KLHL8, Accession XM\_031735). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL8. LIN-28 (Accession NM\_024674) is another VGAM1955 host target gene. LIN-28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIN-28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIN-28 BINDING SITE, designated SEQ ID:23981, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65947] Another function of VGAM1955 is therefore inhibition of LIN-28 (Accession NM\_024674). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN-28. MGC12466 (Accession XM\_086336) is another VGAM1955 host target gene. MGC12466 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by MGC12466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12466 BINDING SITE, designated SEQ ID:38611, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65948] Another function of VGAM1955 is therefore inhibition of MGC12466 (Accession XM\_086336). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12466. MGC14859 (Accession XM\_030295) is another VGAM1955 host target gene. MGC14859 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC14859, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14859 BINDING SITE, designated SEQ ID:31007, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65949] Another function of VGAM1955 is therefore inhibition of

MGC14859 (Accession XM\_030295). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14859. MGC23937 (Accession NM\_145052) is another VGAM1955 host target gene. MGC23937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC23937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23937 BINDING SITE, designated SEQ ID:29683, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65950] Another function of VGAM1955 is therefore inhibition of MGC23937 (Accession NM\_145052). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23937. MGC29898 (Accession NM\_145048) is another VGAM1955 host target gene. MGC29898 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC29898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of MGC29898 BINDING SITE, designated SEQ ID:29680, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65951] Another function of VGAM1955 is therefore inhibition of MGC29898 (Accession NM\_145048). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29898. Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512) is another VGAM1955 host target gene. NUDT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT13 BINDING SITE, designated SEQ ID:31663, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65952] Another function of VGAM1955 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512). Accordingly, utilities of VGAM1955 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with NUDT13. OCT11 (Accession NM\_014352) is another VGAM1955 host target gene. OCT11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OCT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCT11 BINDING SITE, designated SEQ ID:15681, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65953] Another function of VGAM1955 is therefore inhibition of OCT11 (Accession NM\_014352). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCT11. Pellino Homolog 2 (Drosophila) (PELI2, Accession NM\_021255) is another VGAM1955 host target gene. PELI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PELI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:22230,

to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65954] Another function of VGAM1955 is therefore inhibition of Pellino Homolog 2 (Drosophila) (PELI2, Accession NM\_021255). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2. RDC1 (Accession XM\_051522) is another VGAM1955 host target gene. RDC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDC1 BINDING SITE, designated SEQ ID:35848, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65955] Another function of VGAM1955 is therefore inhibition of RDC1 (Accession XM\_051522). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDC1. RES4-22 (Accession NM\_003704) is another VGAM1955 host target gene. RES4-22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by RES4-22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RES4-22 BINDING SITE, designated SEQ ID:9804, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65956] Another function of VGAM1955 is therefore inhibition of RES4-22 (Accession NM\_003704). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RES4-22. SE57-1 (Accession NM\_025214) is another VGAM1955 host target gene. SE57-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SE57-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE57-1 BINDING SITE, designated SEQ ID:24894, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65957] Another function of VGAM1955 is therefore inhibition of SE57-1 (Accession NM\_025214). Accordingly, utilities of

VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE57-1. SP192 (Accession NM\_021639) is another VGAM1955 host target gene. SP192 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SP192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP192 BINDING SITE, designated SEQ ID:22300, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65958] Another function of VGAM1955 is therefore inhibition of SP192 (Accession NM\_021639). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP192. TBDN100 (Accession NM\_025085) is another VGAM1955 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBDN100 BINDING SITE,

designated SEQ ID:24696, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65959] Another function of VGAM1955 is therefore inhibition of TBDN100 (Accession NM\_025085). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. Tumor Necrosis Factor Receptor Superfamily, Member 21 (TNFRSF21, Accession NM\_014452) is another VGAM1955 host target gene. TNFRSF21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF21 BINDING SITE, designated SEQ ID:15804, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65960] Another function of VGAM1955 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 21 (TNFRSF21, Accession NM\_014452). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

TNFRSF21. UBF-fl (Accession NM\_032828) is another VGAM1955 host target gene. UBF-fl BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBF-fl, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBF-fl BINDING SITE, designated SEQ ID:26603, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65961] Another function of VGAM1955 is therefore inhibition of UBF-fl (Accession NM\_032828). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBF-fl. Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM\_014517) is another VGAM1955 host target gene. UB1 BINDING SITE1 and UB1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UB1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UB1 BINDING SITE1 and UB1 BINDING SITE2, designated SEQ ID:15849 and SEQ

ID:15848 respectively, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65962] Another function of VGAM1955 is therefore inhibition of Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM\_014517). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBP1. ZFP106 (Accession NM\_022473) is another VGAM1955 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22838, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65963] Another function of VGAM1955 is therefore inhibition of ZFP106 (Accession NM\_022473). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC120856 (Accession XM\_058509) is another

VGAM1955 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36631, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65964] Another function of VGAM1955 is therefore inhibition of LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC122792 (Accession NM\_145251) is another VGAM1955 host target gene. LOC122792 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122792 BINDING SITE, designated SEQ ID:29765, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65965] Another function of VGAM1955 is therefore inhibition of LOC122792 (Accession NM\_145251). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122792. LOC130074 (Accession XM\_072228) is another VGAM1955 host target gene. LOC130074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:37473, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65966] Another function of VGAM1955 is therefore inhibition of LOC130074 (Accession XM\_072228). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074. LOC135154 (Accession XM\_059752) is another VGAM1955 host target gene. LOC135154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135154, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135154 BINDING SITE, designated SEQ ID:37091, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65967] Another function of VGAM1955 is therefore inhibition of LOC135154 (Accession XM\_059752). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135154. LOC146880 (Accession XM\_085627) is another VGAM1955 host target gene. LOC146880 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146880 BINDING SITE, designated SEQ ID:38260, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65968] Another function of VGAM1955 is therefore inhibition of LOC146880 (Accession XM\_085627). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146880. LOC151963 (Accession XM\_087351) is another VGAM1955 host target gene. LOC151963 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151963 BINDING SITE, designated SEQ ID:39175, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65969] Another function of VGAM1955 is therefore inhibition of LOC151963 (Accession XM\_087351). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151963. LOC152580 (Accession XM\_098240) is another VGAM1955 host target gene. LOC152580 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152580 BINDING SITE, designated SEQ ID:41525, to the nucleotide sequence of VGAM1955 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4666.

[65970] Another function of VGAM1955 is therefore inhibition of LOC152580 (Accession XM\_098240). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152580. LOC158402 (Accession XM\_098936) is another VGAM1955 host target gene. LOC158402 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:41979, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65971] Another function of VGAM1955 is therefore inhibition of LOC158402 (Accession XM\_098936). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402. LOC168667 (Accession XM\_166592) is another VGAM1955 host target gene. LOC168667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC168667, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168667 BINDING SITE, designated SEQ ID:44567, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65972] Another function of VGAM1955 is therefore inhibition of LOC168667 (Accession XM\_166592). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168667. LOC253263 (Accession XM\_173102) is another VGAM1955 host target gene. LOC253263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253263 BINDING SITE, designated SEQ ID:46360, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65973] Another function of VGAM1955 is therefore inhibition of LOC253263 (Accession XM\_173102). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253263. LOC90161 (Accession XM\_029551) is another VGAM1955 host target gene. LOC90161 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90161 BINDING SITE, designated SEQ ID:30904, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65974] Another function of VGAM1955 is therefore inhibition of LOC90161 (Accession XM\_029551). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90161. LOC90317 (Accession XM\_030892) is another VGAM1955 host target gene. LOC90317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90317 BINDING SITE, designated SEQ ID:31209, to the

nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65975] Another function of VGAM1955 is therefore inhibition of LOC90317 (Accession XM\_030892). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90317. LOC91351 (Accession XM\_037817) is another VGAM1955 host target gene. LOC91351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91351 BINDING SITE, designated SEQ ID:32697, to the nucleotide sequence of VGAM1955 RNA, herein designated VGAM RNA, also designated SEQ ID:4666.

[65976] Another function of VGAM1955 is therefore inhibition of LOC91351 (Accession XM\_037817). Accordingly, utilities of VGAM1955 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91351. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1956 (VGAM1956) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[65977] VGAM1956 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1956 was detected is described hereinabove with reference to Figs. 1–8.

[65978] VGAM1956 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1956 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[65979] VGAM1956 gene encodes a VGAM1956 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1956 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1956 precursor RNA is designated SEQ ID:1942, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1942 is located at position 11662 relative to the genome of Macaca Mulatta Rhadinovirus.

[65980] VGAM1956 precursor RNA folds onto itself, forming VGAM1956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[65981] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1956 folded precursor RNA into VGAM1956 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1956 RNA is designated SEQ ID:4667, and is provided hereinbelow with reference to the sequence listing part.

[65982] VGAM1956 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1956 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1956 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[65983] VGAM1956 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1956 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1956 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[65984] The complementary binding of VGAM1956 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1956 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1956 host target RNA into VGAM1956 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[65985] It is appreciated that VGAM1956 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1956 host target genes. The mRNA of each one of this plurality of VGAM1956 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1956 RNA, herein designated VGAM RNA, and which when bound by VGAM1956 RNA causes inhibition of translation of respective one or more VGAM1956 host target proteins.

[65986] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1956 gene, herein designated VGAM GENE, on one or more VGAM1956 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[65987] It is yet further appreciated that a function of VGAM1956 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1956 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1956 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[65988] Nucleotide sequences of the VGAM1956 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1956 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1956 are further described hereinbelow with reference to Table 1.

[65989] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1956 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1956 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[65990] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1956 gene, herein designated VGAM is inhibition of expression of VGAM1956 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1956 correlate with, and may be deduced from, the identity of the target genes which VGAM1956

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[65991] ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM\_005502) is a VGAM1956 host target gene. ABCA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ABCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA1 BINDING SITE, designated SEQ ID:12013, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[65992] A function of VGAM1956 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM\_005502), a gene which camp-dependent and sulfonylurea-sensitive anion transporter. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA1. The function of ABCA1 has been established by previous studies. By a PCR-based approach, Luciani et al. (1994) identified 2 novel mammalian members of the family of ATP-binding cassette (ABC) transporters desig-

nated ABC1 and ABC2 (OMIM Ref. No. 600047). They belong to a group of traffic ATPases encoded as a single multifunctional protein, such as CFTR (OMIM Ref. No. 602421) and P-glycoproteins (see OMIM Ref. No. 171050). Both ABC1 and ABC2 are large, internally symmetrical molecules that contain complete information for a functional 'channel-like' structure, a feature typical of the mammalian transporters at the plasma membrane. In both ABC1 and ABC2, the 2 halves of the molecules do not share extensive sequence similarity, apart from the nucleotide binding domains. This feature, shared with CFTR and with MRP1 (OMIM Ref. No. 158343), is in contrast with the high similarity shown by the 2 halves of P-glycoproteins. The finding argues against internal gene duplication as the event giving rise to the symmetric structure and favors the alternative hypothesis of the fusion of 2 independently evolved genes encoding the 2 halves. Santamarina-Fojo et al. (2000) found that the ABCA1 gene spans 149 kb and contains 50 exons. They identified 62 repetitive Alu sequences in the 49 introns. Comparative analysis of the mouse and human ABCA1 promoter sequences identified specific regulatory elements that are evolutionarily conserved. Pullinger et al.

(2000) analyzed the promoter region of ABCA1. They identified 7 putative SP1 (OMIM Ref. No. 189906)–binding sites, 4 sterol regulatory elements (SREs) similar to the SRE of the low density lipoprotein receptor (LDLR; 606945) promoter region, a CpG island, a possible weak TATA box, 2 distal CCAAT sequences, and binding sites for several other transcription factors.

[65993] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[65994] Luciani, M. F.; Denizot, F.; Savary, S.; Mattei, M. G.; Chimini, G. : Cloning of two novel ABC transporters mapping on human chromosome 9. *Genomics* 21: 150–159, 1994.  
; and

[65995] Santamarina–Fojo, S.; Peterson, K.; Knapper, C.; Qiu, Y.; Freeman, L.; Cheng, J.–F.; Osorio, J.; Remaley, A.; Yang, X.–P.; Haudenschield, C.; Prades, C.; Chimini, G.; Blackmon, E.; Franc.

[65996] Further studies establishing the function and utilities of ABCA1 are found in John Hopkins OMIM database record ID 600046, and in cited publications numbered 10228–9540, 10229, 10230–10231, 7375, 10232–10236, 10243, 10238–10240, 10244, 10249,

9586–7721, 1134 and 9587–7724 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Aspartate Beta-hydroxylase (ASPH, Accession NM\_032466) is another VGAM1956 host target gene. ASPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE, designated SEQ ID:26225, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[65997] Another function of VGAM1956 is therefore inhibition of Aspartate Beta-hydroxylase (ASPH, Accession NM\_032466), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)-like domains of a number of proteins. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH. The function of ASPH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47.BTB

and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM\_001186) is another VGAM1956 host target gene. BACH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH1 BINDING SITE, designated SEQ ID:6859, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[65998] Another function of VGAM1956 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 1 (BACH1, Accession NM\_001186), a gene which acts as repressor or activator, binds to nf- $\kappa$ B binding sites. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH1. The function of BACH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM724. Breast Cancer 1, Early Onset (BRCA1, Accession NM\_007297) is another VGAM1956 host target gene. BRCA1 BINDING SITE

is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BRCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE, designated SEQ ID:14183, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[65999] Another function of VGAM1956 is therefore inhibition of Breast Cancer 1, Early Onset (BRCA1, Accession NM\_007297). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Centrosomal Protein 2 (CEP2, Accession NM\_006779) is another VGAM1956 host target gene. CEP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP2 BINDING SITE, designated SEQ ID:13651, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66000] Another function of VGAM1956 is therefore inhibition of Centrosomal Protein 2 (CEP2, Accession NM\_006779), a gene which interacts with TC10 and CDC42. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP2. The function of CEP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. Carbamoyl-phosphate Synthetase 1, Mitochondrial (CPS1, Accession NM\_001875) is another VGAM1956 host target gene. CPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPS1 BINDING SITE, designated SEQ ID:7603, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66001] Another function of VGAM1956 is therefore inhibition of Carbamoyl-phosphate Synthetase 1, Mitochondrial (CPS1, Accession NM\_001875). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CPS1. DiGeorge Syndrome Critical Region Gene 2 (DGCR2, Accession NM\_005137) is another VGAM1956 host target gene. DGCR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGCR2 BINDING SITE, designated SEQ ID:11613, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66002] Another function of VGAM1956 is therefore inhibition of DiGeorge Syndrome Critical Region Gene 2 (DGCR2, Accession NM\_005137), a gene which could intervene in cell-cell or cell-matrix interactions. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR2. The function of DGCR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1485. Dihydropyrimidine Dehydrogenase (DPYD, Accession XM\_017469) is another VGAM1956

host target gene. DPYD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYD BINDING SITE, designated SEQ ID:30318, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66003] Another function of VGAM1956 is therefore inhibition of Dihydropyrimidine Dehydrogenase (DPYD, Accession XM\_017469). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYD. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_101395) is another VGAM1956 host target gene. DYRK1A BINDING SITE1 and DYRK1A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE1 and DYRK1A BINDING SITE2,

designated SEQ ID:28164 and SEQ ID:28187 respectively, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66004] Another function of VGAM1956 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_101395), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42.EH-domain Containing 2 (EHD2, Accession NM\_014601) is another VGAM1956 host target gene. EHD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD2 BINDING SITE, designated SEQ ID:15963, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66005] Another function of VGAM1956 is therefore inhibition of EH-domain Containing 2 (EHD2, Accession NM\_014601). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD2. ELK4, ETS-domain Protein (SRF accessory protein 1) (ELK4, Accession NM\_021795) is another VGAM1956 host target gene. ELK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELK4 BINDING SITE, designated SEQ ID:22351, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66006] Another function of VGAM1956 is therefore inhibition of ELK4, ETS-domain Protein (SRF accessory protein 1) (ELK4, Accession NM\_021795), a gene which may modulate SAP1 binding to DNA by interacting with its ETS domain. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELK4. The function of ELK4 has been established by previous studies. Regulation of gene expres-

sion often involves the interaction of transcription factors to form multicomponent complexes at promoter and enhancer elements. For example, transcriptional regulation of the FOS gene (OMIM Ref. No. 164810) in response to growth factor stimulation appears to involve a multicomponent complex at the serum response element (SRE). This complex contains the ubiquitous nuclear protein SRF together with a second protein, ternary complex factor (TCF), which cannot bind the SRE by itself. Dalton and Treisman (1992) employed a genetic screen using yeast to identify SAP1, an SRF accessory protein, which has DNA binding properties identical to those of TCF. Subsequently, they identified a related protein, SAP2 (OMIM Ref. No. 600247), by its cDNA sequence homology with the SAP1 cDNA. These proteins contain 3 regions of homology to a third protein, ELK1 (OMIM Ref. No. 311040), which also functions as an SRF accessory protein and is immunologically related to HeLa cell TCF. The SAP1, SAP2, and ELK1 mRNAs are ubiquitous. Shipley et al. (1994) used cDNA probes to isolate cosmid and phage clones harboring genes encoding SAP1 and SAP2. With these clones, they mapped the genes to 1q32 and 12q23, respectively, by fluorescence in situ hybridization. Giovane

et al. (1995) likewise mapped ELK4 to human 1q32 by in situ hybridization. By the same method, they mapped the mouse homolog to chromosome 1E3-G. Mo et al. (1998) determined the crystal structures of the conserved ETS domain of SAP1 bound to DNA sequences from the E74 and c-fos promoters. These structures revealed that a set of conserved residues contact a GGA core DNA sequence. Discrimination for sequences outside this core is mediated by DNA contacts from conserved and nonconserved protein residues and sequence-dependent DNA structural properties characteristic of A-form DNA structure. Modeling studies of a SAP1/SRF/DNA complex suggested that SRF may modulate SAP1 binding to DNA by interacting with its ETS domain.

[66007] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66008] Giovane, A.; Sobieszczuk, P.; Mignon, C.; Mattei, M.-G.; Wasylyk, B. : Locations of the ets subfamily members net, elk1, and sap1 (ELK3, ELK1, and ELK4) on three homologous regions of the mouse and human genomes. *Genomics* 29: 769-772, 1995. ; and

[66009] Mo, Y.; Vaessen, B.; Johnston, K.; Marmorstein, R. : Struc-

tures of SAP-1 bound to DNA targets from the E74 and c-fos promoters: insights into DNA sequence discrimination by Ets proteins.

[66010] Further studies establishing the function and utilities of ELK4 are found in John Hopkins OMIM database record ID 600246, and in cited publications numbered 791 and 8627-7920 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. E1A Binding Protein P300 (EP300, Accession NM\_001429) is another VGAM1956 host target gene. EP300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EP300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EP300 BINDING SITE, designated SEQ ID:7151, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66011] Another function of VGAM1956 is therefore inhibition of E1A Binding Protein P300 (EP300, Accession NM\_001429), a gene which may have a function in cell cycle regulation. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with EP300. The function of EP300 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. EphA2 (EPHA2, Accession NM\_004431) is another VGAM1956 host target gene. EPHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA2 BINDING SITE, designated SEQ ID:10715, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66012] Another function of VGAM1956 is therefore inhibition of EphA2 (EPHA2, Accession NM\_004431), a gene which binds to ephrin-a1, -a3, -a4 and -a5. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA2. The function of EPHA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1289. Ellis Van Creveld Syndrome

(EVC, Accession NM\_014556) is another VGAM1956 host target gene. EVC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:15894, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66013] Another function of VGAM1956 is therefore inhibition of Ellis Van Creveld Syndrome (EVC, Accession NM\_014556). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC. Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440) is another VGAM1956 host target gene. EXTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7170, to the nucleotide sequence of

VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66014] Another function of VGAM1956 is therefore inhibition of Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440), a gene which is a member of the multiple exostoses gene family. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM\_023107) is another VGAM1956 host target gene. FGFR1 BINDING SITE1 through FGFR1 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 through FGFR1 BINDING SITE6, designated SEQ ID:23362, SEQ ID:23366, SEQ ID:23373, SEQ ID:17979, SEQ ID:6208 and SEQ ID:23377 respectively, to the nucleotide se-

quence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66015] Another function of VGAM1956 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM\_023107). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860) is another VGAM1956 host target gene. FSTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL3 BINDING SITE, designated SEQ ID:12470, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66016] Another function of VGAM1956 is therefore inhibition of Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860), a gene which is a member of the follistatin-module-protein family. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FSTL3. The function of FSTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Fucosyltransferase 5 (alpha (1,3) Fucosyltransferase) (FUT5, Accession NM\_002034) is another VGAM1956 host target gene. FUT5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT5 BINDING SITE, designated SEQ ID:7790, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66017] Another function of VGAM1956 is therefore inhibition of Fucosyltransferase 5 (alpha (1,3) Fucosyltransferase) (FUT5, Accession NM\_002034), a gene which may catalyze alpha-1,3 glycosidic linkages involved in the expression of vim-2, lewis x/ssea-1 and sialyl lewis x antigens. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT5. The function of FUT5 and its asso-

ciation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1519. Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession NM\_000150) is another VGAM1956 host target gene. FUT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT6 BINDING SITE, designated SEQ ID:5650, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66018] Another function of VGAM1956 is therefore inhibition of Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession NM\_000150), a gene which is involved in the biosynthesis of the e-selectin ligand, sialyl-lewis x. FUT6 catalyzes the transfer of fucose from gdp-beta-fucose to alpha-2,3 sialylated substrates. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT6. The function of FUT6 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM194. Glucose-6-phosphatase, Transport (glucose-6-phosphate) Protein 1 (G6PT1, Accession NM\_001467) is another VGAM1956 host target gene. G6PT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by G6PT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PT1 BINDING SITE, designated SEQ ID:7200, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66019] Another function of VGAM1956 is therefore inhibition of Glucose-6-phosphatase, Transport (glucose-6-phosphate) Protein 1 (G6PT1, Accession NM\_001467). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PT1. Guanine Nucleotide Binding Protein (G protein), Alpha 11 (Gq class) (GNA11, Accession XM\_072009) is another VGAM1956 host target gene. GNA11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNA11, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNA11 BINDING SITE, designated SEQ ID:37455, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66020] Another function of VGAM1956 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha 11 (Gq class) (GNA11, Accession XM\_072009), a gene which acts as an activator of phospholipase c. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA11. The function of GNA11 has been established by previous studies. Strathmann and Simon (1991) described the Gna11 gene in the mouse. The human gene was cloned by Jiang et al. (1991) and found to be 359 amino acids long. Mouse Gna11 and Gna15 (OMIM Ref. No. 139314) are tandemly duplicated in a head-to-tail array. Davignon et al. (1996) showed that the upstream gene, Gna11, is ubiquitously expressed, whereas expression of the downstream gene, Gna15, is restricted to hematopoietic cells. There was no evidence for alternative splicing within the coding sequence of either gene. Animal

model experiments lend further support to the function of GNA11. Using gene targeting, Offermanns et al. (1998) generated Gna11-deficient mice that were viable and fertile with no apparent behavioral or morphologic defects. They bred Gnaq (OMIM Ref. No. 600998)-deficient mice with Gna11-deficient mice and observed gene dosage effects between Gnaq and Gna11. Embryos completely lacking both genes died in utero with heart malformations. Mice inheriting a single copy of either gene died within hours of birth with craniofacial and/or cardiac defects. Offermanns et al. (1998) concluded that at least 2 active alleles of these genes are required for extrauterine life. Genetic, morphologic, and pharmacologic analyses of intercross offspring inheriting different combinations of these 2 mutations indicated that Gnaq and Gna11 have overlapping functions in embryonic cardiomyocyte proliferation and craniofacial development.

[66021] It is appreciated that the abovementioned animal model for GNA11 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[66022] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [66023] Offermanns, S.; Zhao, L.-P.; Gohla, A.; Sarosi, I.; Simon, M. I.; Wilkie, T. M. : Embryonic cardiomyocyte hypoplasia and craniofacial defects in G-alpha-q/G-alpha-11-mutant mice. EMBO J. 17: 4304-4312, 1998. ; and
- [66024] Strathmann, M. P.; Simon, M. I. : G-alpha-12 and G-alpha-13 subunits define a fourth class of G protein alpha subunits. Proc. Nat. Acad. Sci. 88: 5582-5586, 1991.
- [66025] Further studies establishing the function and utilities of GNA11 are found in John Hopkins OMIM database record ID 139313, and in cited publications numbered 11937-1194 and 2186 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM\_009220) is another VGAM1956 host target gene. GNA15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNA15 BINDING SITE, designated SEQ ID:30105, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA,

also designated SEQ ID:4667.

[66026] Another function of VGAM1956 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM\_009220). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA15. Glypican 6 (GPC6, Accession NM\_005708) is another VGAM1956 host target gene. GPC6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC6 BINDING SITE, designated SEQ ID:12260, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66027] Another function of VGAM1956 is therefore inhibition of Glypican 6 (GPC6, Accession NM\_005708), a gene which may play a role in growth control and differentiation. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC6. The function of GPC6 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM247. Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM\_000838) is another VGAM1956 host target gene. GRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM1 BINDING SITE, designated SEQ ID:6497, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66028] Another function of VGAM1956 is therefore inhibition of Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM\_000838), a gene which promotes phosphoinositide hydrolysis. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM1. The function of GRM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786. Histamine Receptor H1 (HRH1, Accession NM\_000861) is another VGAM1956 host target gene.

HRH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH1 BINDING SITE, designated SEQ ID:6526, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66029] Another function of VGAM1956 is therefore inhibition of Histamine Receptor H1 (HRH1, Accession NM\_000861), a gene which stimulates the synthesis of inositol phosphate. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH1. The function of HRH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766. Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262) is another VGAM1956 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14575, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66030] Another function of VGAM1956 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1. HTRA3 (Accession XM\_114416) is another VGAM1956 host target gene. HTRA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:42943, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66031] Another function of VGAM1956 is therefore inhibition of HTRA3 (Accession XM\_114416). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTRA3.

Insulin Receptor Substrate 2 (IRS2, Accession XM\_007095) is another VGAM1956 host target gene. IRS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS2 BINDING SITE, designated SEQ ID:30035, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66032] Another function of VGAM1956 is therefore inhibition of Insulin Receptor Substrate 2 (IRS2, Accession XM\_007095), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS2. The function of IRS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1217. Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession NM\_000632) is another VGAM1956 host target gene.

ITGAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAM BINDING SITE, designated SEQ ID:6249, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66033] Another function of VGAM1956 is therefore inhibition of Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession NM\_000632), a gene which is involved in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement-coated particles. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAM. The function of ITGAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1386. Lactate Dehydrogenase C (LDHC, Accession NM\_002301) is another VGAM1956 host target gene. LDHC BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LDHC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHC BINDING SITE, designated SEQ ID:8092, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66034] Another function of VGAM1956 is therefore inhibition of Lactate Dehydrogenase C (LDHC, Accession NM\_002301). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHC. Lysyl Oxidase-like 2 (LOXL2, Accession NM\_002318) is another VGAM1956 host target gene. LOXL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOXL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOXL2 BINDING SITE, designated SEQ ID:8134, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66035] Another function of VGAM1956 is therefore inhibition of Lysyl Oxidase-like 2 (LOXL2, Accession NM\_002318), a gene which may have roles in senescence and cell adhesion. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL2. The function of LOXL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM147. Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM\_138768) is another VGAM1956 host target gene. MYEOV BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYEOV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYEOV BINDING SITE, designated SEQ ID:29002, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66036] Another function of VGAM1956 is therefore inhibition of Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession

NM\_138768), a gene which is encoded by MYELOMA OVEREXPRESSED GENE. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYEOV. The function of MYEOV and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM471. Pericentriolar Material 1 (PCM1, Accession NM\_006197) is another VGAM1956 host target gene. PCM1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCM1 BINDING SITE, designated SEQ ID:12870, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66037] Another function of VGAM1956 is therefore inhibition of Pericentriolar Material 1 (PCM1, Accession NM\_006197), a gene which appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with PCM1. The function of PCM1 has been established by previous studies. Balczon et al. (1994) identified a 228-kD centrosome autoantigen designated PCM1 for pericentriolar material-1. In the course of investigating the region 8p22-p21.3, commonly involved in loss of heterozygosity in hepatocellular carcinomas, colorectal cancers, and non-small-cell lung cancers, Ohata et al. (1994) found a gene that was 100% identical to the nucleotide sequences of the cDNA for PCM1. The cosmid had previously been mapped to the 8p22-p21.3 region by fluorescence in situ hybridization and by pulsed field gel electrophoresis. Screening for rearrangements in Southern blots containing DNAs of a large number of cancers of the above-mentioned 3 types failed to demonstrate obvious rearrangements; however, a HindIII polymorphism in the PCM1 gene was found. The RET protooncogene (OMIM Ref. No. 164761) is often activated through somatic rearrangements in papillary thyroid carcinomas (OMIM Ref. No. 188550). Three main rearranged forms of RET have been described: RET/PTC1, in which the partner is called H4 (OMIM Ref. No. 601985) and RET/PTC3, in which the partner is called NCOA4 (OMIM Ref. No. 601984), both of which arise from a paracentric in-

version on 10q; and RET/PTC2, in which the partner is PRKAR1A (OMIM Ref. No. 188830), which originates from a 10;17 translocation. Corvi et al. (2000) identified a rearrangement involving the RET tyrosine kinase domain and the 5-prime portion of PCM1. FISH analysis confirmed the chromosomal localization of PCM1 on 8p22-p21. Immunohistochemistry using an antibody specific for the C-terminal portion of PCM1 showed that the protein level was drastically decreased and its subcellular localization altered in papillary thyroid tumor tissue with respect to normal thyroid.

[66038] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66039] Corvi, R.; Berger, N.; Balczon, R.; Romeo, G. : RET/PCM-1: a novel fusion gene in papillary thyroid carcinoma. *Oncogene* 19: 4236-4242, 2000. ; and

[66040] Ohata, H.; Fujiwara, Y.; Koyama, K.; Nakamura, Y. : Mapping of the human autoantigen pericentriolar material 1 (PCM1) gene to chromosome 8p21.3-p22. *Genomics* 24: 404-406, 1994.

[66041] Further studies establishing the function and utilities of PCM1 are found in John Hopkins OMIM database record ID

600299, and in cited publications numbered 158 and 1592–1593 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM\_006206) is another VGAM1956 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:12885, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66042] Another function of VGAM1956 is therefore inhibition of Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM\_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM117. Pim-1 Oncogene (PIM1, Accession XM\_165800) is another VGAM1956 host target gene. PIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIM1 BINDING SITE, designated SEQ ID:43757, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66043] Another function of VGAM1956 is therefore inhibition of Pim-1 Oncogene (PIM1, Accession XM\_165800), a gene which is a protooncogene. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIM1. The function of PIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Perilipin (PLIN, Accession NM\_002666) is another VGAM1956 host target gene. PLIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLIN, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLIN BINDING SITE, designated SEQ ID:8536, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66044] Another function of VGAM1956 is therefore inhibition of Perilipin (PLIN, Accession NM\_002666). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLIN. POM (POM121 homolog, rat) and ZP3 Fusion (POMZP3, Accession NM\_012230) is another VGAM1956 host target gene. POMZP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by POMZP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POMZP3 BINDING SITE, designated SEQ ID:14529, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66045] Another function of VGAM1956 is therefore inhibition of POM (POM121 homolog, rat) and ZP3 Fusion (POMZP3,

Accession NM\_012230). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMZP3. Paraoxonase 1 (PON1, Accession NM\_000446) is another VGAM1956 host target gene. PON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PON1 BINDING SITE, designated SEQ ID:6033, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66046] Another function of VGAM1956 is therefore inhibition of Paraoxonase 1 (PON1, Accession NM\_000446), a gene which hydrolyzes the toxic metabolites of a variety of organophosphorus insecticides. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PON1. The function of PON1 has been established by previous studies. Two factors result in large individual variations in PON serum levels: a substrate-dependent activity polymorphism and large individual differences in PON protein

levels that are stable over time. Animal model studies indicated that PON activity levels are likely to play a major role in determining sensitivity to several organophosphate insecticides (Clendenning et al., 1996). The arg192 isoform (168820.0001) appears to be a risk factor in coronary artery disease. Serum paraoxonase is an esterase that is associated with high density lipoproteins (HDLs) in the plasma. It is involved in the detoxification of organophosphate insecticides such as parathion and chlorpyrifos. PON1 may also confer protection against coronary artery disease by destroying proinflammatory oxidized lipids present in oxidized low density lipoproteins (LDLs). To study the role of PON1 in vivo, Shih et al. (1998) created PON1-knockout mice by gene targeting. Compared with their wildtype littermates, PON1-deficient mice were extremely sensitive to the toxic effects of chlorpyrifos oxon, the activated form of chlorpyrifos, and were more sensitive to chlorpyrifos itself. HDLs isolated from PON1-deficient mice were unable to prevent LDL oxidation in a cocultured cell model of the artery wall, and both HDLs and LDLs isolated from PON1-knockout mice were more susceptible to oxidation by cocultured cells than were lipoproteins from wildtype littermates. When

fed on a high-fat, high-cholesterol diet, PON1-null mice were more susceptible to atherosclerosis than were their wildtype littermates.

[66047] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66048] Clendenning, J. B.; Humbert, R.; Green, E. D.; Wood, C.; Traver, D.; Furlong, C. E. : Structural organization of the human PON1 gene. *Genomics* 35: 586–589, 1996. ; and

[66049] Shih, D. M.; Gu, L.; Xia, Y.-R.; Navab, M.; Li, W.-F.; Hama, S.; Castellani, L. W.; Furlong, C. E.; Costa, L. G.; Fogelman, A. M.; Lusis, A. J. : Mice lacking serum paraoxonase are susceptible.

[66050] Further studies establishing the function and utilities of PON1 are found in John Hopkins OMIM database record ID 168820, and in cited publications numbered 11543–11555, 9, 2465–2486, 3780–249 and 3251–3252 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prospero-related Homeobox 1 (PROX1, Accession NM\_002763) is another VGAM1956 host target gene. PROX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PROX1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROX1 BINDING SITE, designated SEQ ID:8651, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66051] Another function of VGAM1956 is therefore inhibition of Prospero-related Homeobox 1 (PROX1, Accession NM\_002763), a gene which may regulate gene expression and development of postmitotic undifferentiated young neurons. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROX1. The function of PROX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Prosaposin (variant Gaucher disease and variant metachromatic leukodystrophy) (PSAP, Accession XM\_045140) is another VGAM1956 host target gene. PSAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PSAP BINDING SITE, designated SEQ ID:34374, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66052] Another function of VGAM1956 is therefore inhibition of Prosaposin (variant Gaucher disease and variant metachromatic leukodystrophy) (PSAP, Accession XM\_045140). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSAP. Prostaglandin-endoperoxide Synthase 2 (prostaglandin G/H synthase and cyclooxygenase) (PTGS2, Accession NM\_000963) is another VGAM1956 host target gene. PTGS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS2 BINDING SITE, designated SEQ ID:6684, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66053] Another function of VGAM1956 is therefore inhibition of Prostaglandin-endoperoxide Synthase 2 (prostaglandin G/

H synthase and cyclooxygenase) (PTGS2, Accession NM\_000963), a gene which may have a role as a major mediator of inflammation and/or a role for prostanoid signaling in activity-dependent plasticity. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS2. The function of PTGS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM292.

**RaIA Binding Protein 1** (RALBP1, Accession NM\_006788) is another VGAM1956 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, designated SEQ ID:13665, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66054] Another function of VGAM1956 is therefore inhibition of RaIA Binding Protein 1 (RALBP1, Accession NM\_006788), a gene which plays a role in signal transduction and cat-

alyzes the transport of glutathione conjugates and xenobiotics. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345. Retinoic Acid Receptor, Alpha (RARA, Accession NM\_000964) is another VGAM1956 host target gene. RARA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RARA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RARA BINDING SITE, designated SEQ ID:6689, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66055] Another function of VGAM1956 is therefore inhibition of Retinoic Acid Receptor, Alpha (RARA, Accession NM\_000964). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARA. RP42 (Accession NM\_020640) is another VGAM1956 host target gene.

RP42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP42 BINDING SITE, designated SEQ ID:21802, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66056] Another function of VGAM1956 is therefore inhibition of RP42 (Accession NM\_020640), a gene which not clear yet. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP42. The function of RP42 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47. Ribophorin II (RPN2, Accession NM\_002951) is another VGAM1956 host target gene. RPN2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPN2 BINDING SITE, designated SEQ

ID:8863, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66057] Another function of VGAM1956 is therefore inhibition of Ribophorin II (RPN2, Accession NM\_002951). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPN2. Spinocerebellar Ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NM\_000332) is another VGAM1956 host target gene. SCA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCA1 BINDING SITE, designated SEQ ID:5880, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66058] Another function of VGAM1956 is therefore inhibition of Spinocerebellar Ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NM\_000332). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SCA1. Syndecan 1 (SDC1, Accession NM\_002997) is another VGAM1956 host target gene. SDC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC1 BINDING SITE, designated SEQ ID:8888, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66059] Another function of VGAM1956 is therefore inhibition of Syndecan 1 (SDC1, Accession NM\_002997), a gene which mediates cell behaviors like cell adhesion, action of growth factors. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC1. The function of SDC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM534. Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM\_014011) is another VGAM1956 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15229, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66060] Another function of VGAM1956 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM\_014011). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. SRY (sex determining region Y)-box 13 (SOX13, Accession NM\_005686) is another VGAM1956 host target gene. SOX13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX13 BINDING SITE, designated SEQ ID:12244, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66061] Another function of VGAM1956 is therefore inhibition of

SRY (sex determining region Y)-box 13 (SOX13, Accession NM\_005686). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX13. SWAP70 (Accession XM\_049197) is another VGAM1956 host target gene.

SWAP70 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SWAP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SWAP70 BINDING SITE, designated SEQ ID:35349, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66062] Another function of VGAM1956 is therefore inhibition of SWAP70 (Accession XM\_049197), a gene which is involved not only in nuclear events but also in signaling in B-cell activation. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP70. The function of SWAP70 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1090.TAF6 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 80kDa (TAF6, Accession NM\_005641) is another VGAM1956 host target gene. TAF6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TAF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF6 BINDING SITE, designated SEQ ID:12174, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66063] Another function of VGAM1956 is therefore inhibition of TAF6 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 80kDa (TAF6, Accession NM\_005641), a gene which plays a central role in mediating promoter responses to various activators and repressors. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF6. The function of TAF6 has been established by previous studies. TFIID is an essential general transcription factor (GTF) that binds stably to the TATA element of class II promoters and nucleates the assembly of other GTFs (e.g., 600519) and RNA polymerase

II (see OMIM Ref. No. 180660) into a functional preinitiation complex. It is composed of a highly conserved TATA-binding polypeptide (TBP; 600075) and tightly associated polypeptides called TBP-associated factors (TAFs), which are required for activator-dependent transcription. By screening a HeLa cell cDNA library with a *Drosophila* TAFII60 cDNA, Weinzierl et al. (1993) isolated cDNAs encoding TAF2E, which they called TAFII70. Sequence analysis revealed 3 distinct TAFII70 cDNAs, and the authors suggested that they corresponded to alternatively spliced transcripts. Southern blot analysis of human genomic DNA confirmed that TAFII70 is a single-copy gene. The 3 predicted TAFII70 proteins have 667, 677, and 726 amino acids; Weinzierl et al. (1993) chose a cDNA encoding the 677-amino acid isoform for further characterization. Recombinant TAFII70 bound weakly to TBP and tightly to TAFII250 (TAF2A; 313650), the largest subunit of TFIID. In the presence of TAFII70, TBP, and TAFII250, a stable ternary complex was formed. Independently, Hisatake et al. (1995) isolated a cDNA encoding TAF2E, which they called TAFII80, by screening a human placenta cDNA library with a 'best-guess' oligonucleotide based on a peptide sequence of TAFII80. Northern blot analysis detected

a 2.5-kb TAFII80 transcript. The predicted protein was identical to the deduced 677-amino acid protein of Weinzierl et al. (1993). TAFII80 is proline-rich overall and has a serine-, threonine-, and proline-rich region at its C terminus. The TAFII80 and Drosophila TAFII60 proteins share conserved regions of 50% and 64% sequence identity within their N-terminal and central sections, respectively. An N-terminal 55-amino acid segment of TAFII80 is 24% identical to a region of histone H4 that is believed to form part of the hydrophobic core of the histone octamer. TAFII80 from HeLa cell extracts had a molecular mass of 80 kD by Western blot analysis. Coimmunoprecipitation studies showed that TAFII80 interacted with TBP, TAFII250, TAFII31 (TAF2G; 600822), TAFII20 (TAF2J; 600773), TFIIE- $\alpha$  (GTF2E1; 189962), and TFIIF- $\alpha$  (GTF2F1; 189968); Hisatake et al. (1995) identified 3 distinct domains in TAFII80 that are involved in these interactions. TAFII80 did not interact with TAFII55 (TAF2F; 600573), TFIIB (GTF2B; 189963), TFIIE- $\beta$  (GTF2E2; 189964), or TFIIF- $\beta$  (GTF2F2; 189969).

[66064] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [66065] Hisatake, K.; Ohta, T.; Takada, R.; Guermah, M.; Horikoshi, M.; Nakatani, Y.; Roeder, R. G. : Evolutionary conservation of human TATA-binding-polypeptide-associated factors TAFII31 and TAFII80 and interactions of TAFII80 with other TAFs and with general transcription factors. Proc. Nat. Acad. Sci. 92: 8195–8199, 1995. ; and
- [66066] Weinzierl, R. O. J.; Ruppert, S.; Dynlacht, B. D.; Tanese, N.; Tjian, R. : Cloning and expression of Drosophila TAFII60 and human TAFII70 reveal conserved interactions with other subunit.
- [66067] Further studies establishing the function and utilities of TAF6 are found in John Hopkins OMIM database record ID 602955, and in cited publications numbered 8641–8643 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TNF Receptor-associated Factor 5 (TRAF5, Accession NM\_004619) is another VGAM1956 host target gene. TRAF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF5 BINDING SITE, designated SEQ ID:10967, to the nucleotide se-

quence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66068] Another function of VGAM1956 is therefore inhibition of TNF Receptor-associated Factor 5 (TRAF5, Accession NM\_004619), a gene which Member of a family of proteins that interact with TNF receptors; binds the lymphotoxin beta receptor (LTBR). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF5. The function of TRAF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM76.UV Radiation Resistance Associated Gene (UVRAG, Accession NM\_003369) is another VGAM1956 host target gene. UVRAG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by UVRAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UVRAG BINDING SITE, designated SEQ ID:9394, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66069] Another function of VGAM1956 is therefore inhibition of UV Radiation Resistance Associated Gene (UVRAG, Accession NM\_003369). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UVRAG. Vitamin D (1,25– dihydroxyvitamin D3) Receptor (VDR, Accession NM\_000376) is another VGAM1956 host target gene. VDR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE, designated SEQ ID:5948, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66070] Another function of VGAM1956 is therefore inhibition of Vitamin D (1,25– dihydroxyvitamin D3) Receptor (VDR, Accession NM\_000376). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR. Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_133332) is another VGAM1956 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:28454, SEQ ID:28471 and SEQ ID:17190 respectively, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66071] Another function of VGAM1956 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_133332), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.ACF (Accession NM\_138932) is another VGAM1956 host target gene. ACF BINDING SITE1 and ACF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACF, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACF BINDING SITE1 and ACF BINDING SITE2, designated SEQ ID:29059 and SEQ ID:15938 respectively, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66072] Another function of VGAM1956 is therefore inhibition of ACF (Accession NM\_138932). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACF. Bol, Boule-like (Drosophila) (BOLL, Accession NM\_033030) is another VGAM1956 host target gene. BOLL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BOLL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BOLL BINDING SITE, designated SEQ ID:26922, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66073] Another function of VGAM1956 is therefore inhibition of Bol, Boule-like (Drosophila) (BOLL, Accession NM\_033030). Accordingly, utilities of VGAM1956 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with BOLL. Chromosome 22 Open Reading Frame 2 (C22orf2, Accession XM\_170492) is another VGAM1956 host target gene. C22orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf2 BINDING SITE, designated SEQ ID:45335, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66074] Another function of VGAM1956 is therefore inhibition of Chromosome 22 Open Reading Frame 2 (C22orf2, Accession XM\_170492). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf2. Chromobox Homolog 3 (HP1 gamma homolog, Drosophila) (CBX3, Accession NM\_007276) is another VGAM1956 host target gene. CBX3 BINDING SITE1 and CBX3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBX3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II

or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX3 BINDING SITE1 and CBX3 BINDING SITE2, designated SEQ ID:14142 and SEQ ID:18662 respectively, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66075] Another function of VGAM1956 is therefore inhibition of Chromobox Homolog 3 (HP1 gamma homolog, *Drosophila*) (CBX3, Accession NM\_007276). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX3. Chromatin Accessibility Complex 1 (CHRAC1, Accession NM\_017444) is another VGAM1956 host target gene. CHRAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:18909, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66076] Another function of VGAM1956 is therefore inhibition of

Chromatin Accessibility Complex 1 (CHRAC1, Accession NM\_017444). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273) is another VGAM1956 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10484, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66077] Another function of VGAM1956 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. CRMP5 (Accession NM\_020134) is another VGAM1956 host target gene. CRMP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by CRMP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRMP5 BINDING SITE, designated SEQ ID:21334, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66078] Another function of VGAM1956 is therefore inhibition of CRMP5 (Accession NM\_020134). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRMP5. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 17, 72kDa (DDX17, Accession NM\_030881) is another VGAM1956 host target gene. DDX17 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DDX17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX17 BINDING SITE, designated SEQ ID:25156, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66079] Another function of VGAM1956 is therefore inhibition of

DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 17, 72kDa (DDX17, Accession NM\_030881). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX17. DKFZP434B044 (Accession NM\_031476) is another VGAM1956 host target gene. DKFZP434B044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434B044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B044 BINDING SITE, designated SEQ ID:25554, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66080] Another function of VGAM1956 is therefore inhibition of DKFZP434B044 (Accession NM\_031476). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B044. DKFZP762D096 (Accession XM\_037662) is another VGAM1956 host target gene. DKFZP762D096 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

DKFZP762D096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP762D096 BINDING SITE, designated SEQ ID:32666, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66081] Another function of VGAM1956 is therefore inhibition of DKFZP762D096 (Accession XM\_037662). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP762D096. Endothelial Cell-specific Molecule 1 (ESM1, Accession NM\_007036) is another VGAM1956 host target gene. ESM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESM1 BINDING SITE, designated SEQ ID:13913, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66082] Another function of VGAM1956 is therefore inhibition of

Endothelial Cell-specific Molecule 1 (ESM1, Accession NM\_007036). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESM1. FENS-1 (Accession NM\_020830) is another VGAM1956 host target gene. FENS-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FENS-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FENS-1 BINDING SITE, designated SEQ ID:21892, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66083] Another function of VGAM1956 is therefore inhibition of FENS-1 (Accession NM\_020830). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FENS-1. FLB6421 (Accession NM\_020119) is another VGAM1956 host target gene. FLB6421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLB6421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLB6421 BINDING SITE, designated SEQ ID:21302, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66084] Another function of VGAM1956 is therefore inhibition of FLB6421 (Accession NM\_020119). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLB6421. FLJ10521 (Accession NM\_018125) is another VGAM1956 host target gene. FLJ10521 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10521 BINDING SITE, designated SEQ ID:19912, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66085] Another function of VGAM1956 is therefore inhibition of FLJ10521 (Accession NM\_018125). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10521. FLJ10713 (Accession NM\_018189) is another VGAM1956 host target gene. FLJ10713 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10713 BINDING SITE, designated SEQ ID:20042, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66086] Another function of VGAM1956 is therefore inhibition of FLJ10713 (Accession NM\_018189). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10713. FLJ11164 (Accession NM\_018346) is another VGAM1956 host target gene. FLJ11164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11164 BINDING SITE, designated SEQ ID:20358, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM

RNA, also designated SEQ ID:4667.

[66087] Another function of VGAM1956 is therefore inhibition of FLJ11164 (Accession NM\_018346). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11164. FLJ11362 (Accession NM\_021946) is another VGAM1956 host target gene. FLJ11362 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11362 BINDING SITE, designated SEQ ID:22471, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66088] Another function of VGAM1956 is therefore inhibition of FLJ11362 (Accession NM\_021946). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11362. FLJ13197 (Accession NM\_024614) is another VGAM1956 host target gene. FLJ13197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13197, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13197 BINDING SITE, designated SEQ ID:23872, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66089] Another function of VGAM1956 is therefore inhibition of FLJ13197 (Accession NM\_024614). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13197. FLJ13441 (Accession NM\_023924) is another VGAM1956 host target gene. FLJ13441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:23394, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66090] Another function of VGAM1956 is therefore inhibition of FLJ13441 (Accession NM\_023924). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13441. FLJ13993 (Accession XM\_017638) is another VGAM1956 host target gene. FLJ13993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13993 BINDING SITE, designated SEQ ID:30327, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66091] Another function of VGAM1956 is therefore inhibition of FLJ13993 (Accession XM\_017638). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13993. FLJ14075 (Accession NM\_024894) is another VGAM1956 host target gene. FLJ14075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14075 BINDING SITE, designated SEQ ID:24376, to the nucleotide

sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66092] Another function of VGAM1956 is therefore inhibition of FLJ14075 (Accession NM\_024894). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14075. FLJ22548 (Accession NM\_022456) is another VGAM1956 host target gene. FLJ22548 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22548 BINDING SITE, designated SEQ ID:22794, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66093] Another function of VGAM1956 is therefore inhibition of FLJ22548 (Accession NM\_022456). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22548. FLJ23042 (Accession NM\_025157) is another VGAM1956 host target gene. FLJ23042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ23042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23042 BINDING SITE, designated SEQ ID:24797, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66094] Another function of VGAM1956 is therefore inhibition of FLJ23042 (Accession NM\_025157). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23042. FLJ23360 (Accession NM\_023076) is another VGAM1956 host target gene. FLJ23360 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23360 BINDING SITE, designated SEQ ID:23336, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66095] Another function of VGAM1956 is therefore inhibition of FLJ23360 (Accession NM\_023076). Accordingly, utilities of

VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23360. FLJ30681 (Accession XM\_166291) is another VGAM1956 host target gene. FLJ30681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30681 BINDING SITE, designated SEQ ID:44106, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66096] Another function of VGAM1956 is therefore inhibition of FLJ30681 (Accession XM\_166291). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30681. GMPPB (Accession XM\_171044) is another VGAM1956 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE,

designated SEQ ID:45817, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66097] Another function of VGAM1956 is therefore inhibition of GMPPB (Accession XM\_171044). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. GTP Binding Protein 2 (GTPBP2, Accession NM\_019096) is another VGAM1956 host target gene. GTPBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP2 BINDING SITE, designated SEQ ID:21173, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66098] Another function of VGAM1956 is therefore inhibition of GTP Binding Protein 2 (GTPBP2, Accession NM\_019096). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP2. Hypermethylated In Cancer 2 (HIC2, Accession XM\_036937) is another VGAM1956

host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32531, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66099] Another function of VGAM1956 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM\_036937). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. HIG2 (Accession NM\_013332) is another VGAM1956 host target gene. HIG2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HIG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIG2 BINDING SITE, designated SEQ ID:14978, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66100] Another function of VGAM1956 is therefore inhibition of HIG2 (Accession NM\_013332). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIG2. HSC3 (Accession NM\_145174) is another VGAM1956 host target gene. HSC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSC3 BINDING SITE, designated SEQ ID:29735, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66101] Another function of VGAM1956 is therefore inhibition of HSC3 (Accession NM\_145174). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSC3. HYPH (Accession XM\_170722) is another VGAM1956 host target gene. HYPH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HYPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HYPH BINDING SITE, designated SEQ ID:45483, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66102] Another function of VGAM1956 is therefore inhibition of HYPH (Accession XM\_170722). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYPH. Interleukin 1 Family, Member 10 (theta) (IL1F10, Accession NM\_032556) is another VGAM1956 host target gene. IL1F10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL1F10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F10 BINDING SITE, designated SEQ ID:26284, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66103] Another function of VGAM1956 is therefore inhibition of Interleukin 1 Family, Member 10 (theta) (IL1F10, Accession NM\_032556). Accordingly, utilities of VGAM1956 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F10. KIAA0057 (Accession NM\_012288) is another VGAM1956 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14624, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66104] Another function of VGAM1956 is therefore inhibition of KIAA0057 (Accession NM\_012288). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. KIAA0317 (Accession NM\_014821) is another VGAM1956 host target gene. KIAA0317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0317 BINDING SITE, designated SEQ ID:16796, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66105] Another function of VGAM1956 is therefore inhibition of KIAA0317 (Accession NM\_014821). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0317. KIAA0453 (Accession XM\_044546) is another VGAM1956 host target gene. KIAA0453 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0453 BINDING SITE, designated SEQ ID:34230, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66106] Another function of VGAM1956 is therefore inhibition of KIAA0453 (Accession XM\_044546). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0453. KIAA0618 (Accession NM\_014833) is another VGAM1956 host target gene. KIAA0618 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:16837, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66107] Another function of VGAM1956 is therefore inhibition of KIAA0618 (Accession NM\_014833). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. KIAA0931 (Accession XM\_041191) is another VGAM1956 host target gene. KIAA0931 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:33487, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66108] Another function of VGAM1956 is therefore inhibition of

KIAA0931 (Accession XM\_041191). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931. KIAA1013 (Accession XM\_114303) is another VGAM1956 host target gene. KIAA1013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1013 BINDING SITE, designated SEQ ID:42859, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66109] Another function of VGAM1956 is therefore inhibition of KIAA1013 (Accession XM\_114303). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1013. KIAA1017 (Accession NM\_007216) is another VGAM1956 host target gene. KIAA1017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1017 BINDING SITE, designated SEQ ID:14081, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66110] Another function of VGAM1956 is therefore inhibition of KIAA1017 (Accession NM\_007216). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1017. KIAA1193 (Accession XM\_041843) is another VGAM1956 host target gene. KIAA1193 BINDING SITE1 through KIAA1193 BINDING SITE21 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1193, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE1 through KIAA1193 BINDING SITE21, designated SEQ ID:33591, SEQ ID:33606, SEQ ID:33604, SEQ ID:33605, SEQ ID:33600, SEQ ID:33603, SEQ ID:33590, SEQ ID:33592, SEQ ID:33594, SEQ ID:33597, SEQ ID:33586, SEQ ID:33587, SEQ ID:33588, SEQ ID:33589, SEQ ID:33595, SEQ ID:33596, SEQ ID:33593, SEQ ID:33601, SEQ ID:33602, SEQ ID:33598 and SEQ ID:33599 respec-

tively, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66111] Another function of VGAM1956 is therefore inhibition of KIAA1193 (Accession XM\_041843). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. KIAA1323 (Accession XM\_032146) is another VGAM1956 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31568, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66112] Another function of VGAM1956 is therefore inhibition of KIAA1323 (Accession XM\_032146). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. KIAA1332 (Accession XM\_048774) is another VGAM1956 host target gene. KIAA1332 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:35260, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66113] Another function of VGAM1956 is therefore inhibition of KIAA1332 (Accession XM\_048774). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332. KIAA1450 (Accession XM\_038035) is another VGAM1956 host target gene. KIAA1450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1450 BINDING SITE, designated SEQ ID:32749, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66114] Another function of VGAM1956 is therefore inhibition of

KIAA1450 (Accession XM\_038035). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1450. KIAA1627 (Accession XM\_087571) is another VGAM1956 host target gene. KIAA1627 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1627 BINDING SITE, designated SEQ ID:39344, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66115] Another function of VGAM1956 is therefore inhibition of KIAA1627 (Accession XM\_087571). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1627. KIAA1878 (Accession XM\_166256) is another VGAM1956 host target gene. KIAA1878 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1878 BINDING SITE, designated SEQ ID:44078, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66116] Another function of VGAM1956 is therefore inhibition of KIAA1878 (Accession XM\_166256). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1878. KIAA1900 (Accession XM\_055299) is another VGAM1956 host target gene. KIAA1900 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1900 BINDING SITE, designated SEQ ID:36259, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66117] Another function of VGAM1956 is therefore inhibition of KIAA1900 (Accession XM\_055299). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1900. KIAA1932 (Accession XM\_055900) is another

VGAM1956 host target gene. KIAA1932 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1932 BINDING SITE, designated SEQ ID:36350, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66118] Another function of VGAM1956 is therefore inhibition of KIAA1932 (Accession XM\_055900). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1932. KR18 (Accession NM\_033288) is another VGAM1956 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27117, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66119] Another function of VGAM1956 is therefore inhibition of KR18 (Accession NM\_033288). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. LIG-1 (Accession XM\_033712) is another VGAM1956 host target gene. LIG-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIG-1 BINDING SITE, designated SEQ ID:31953, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66120] Another function of VGAM1956 is therefore inhibition of LIG-1 (Accession XM\_033712). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG-1. LIM Domain Kinase 2 (LIMK2, Accession NM\_005569) is another VGAM1956 host target gene. LIMK2 BINDING SITE1 and LIMK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIMK2, corresponding to HOST TARGET binding sites such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK2 BINDING SITE1 and LIMK2 BINDING SITE2, designated SEQ ID:12096 and SEQ ID:18787 respectively, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66121] Another function of VGAM1956 is therefore inhibition of LIM Domain Kinase 2 (LIMK2, Accession NM\_005569). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK2. Mitogen-activated Protein Kinase-activated Protein Kinase 2 (MAPKAPK2, Accession NM\_004759) is another VGAM1956 host target gene. MAPKAPK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPKAPK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPKAPK2 BINDING SITE, designated SEQ ID:11151, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66122] Another function of VGAM1956 is therefore inhibition of Mitogen-activated Protein Kinase-activated Protein Kinase 2 (MAPKAPK2, Accession NM\_004759). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKAPK2. MGC13040 (Accession NM\_032930) is another VGAM1956 host target gene. MGC13040 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13040 BINDING SITE, designated SEQ ID:26755, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66123] Another function of VGAM1956 is therefore inhibition of MGC13040 (Accession NM\_032930). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13040. MGC14386 (Accession NM\_033544) is another VGAM1956 host target gene. MGC14386 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC14386, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14386 BINDING SITE, designated SEQ ID:27307, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66124] Another function of VGAM1956 is therefore inhibition of MGC14386 (Accession NM\_033544). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14386. MGC20481 (Accession XM\_031555) is another VGAM1956 host target gene. MGC20481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20481 BINDING SITE, designated SEQ ID:31425, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66125] Another function of VGAM1956 is therefore inhibition of MGC20481 (Accession XM\_031555). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC20481. MGC2477 (Accession NM\_024099) is another VGAM1956 host target gene. MGC2477 BINDING SITE1 and MGC2477 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC2477, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2477 BINDING SITE1 and MGC2477 BINDING SITE2, designated SEQ ID:23544 and SEQ ID:23543 respectively, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66126] Another function of VGAM1956 is therefore inhibition of MGC2477 (Accession NM\_024099). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2477. MGC4342 (Accession NM\_024329) is another VGAM1956 host target gene. MGC4342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC4342 BINDING SITE, designated SEQ ID:23625, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66127] Another function of VGAM1956 is therefore inhibition of MGC4342 (Accession NM\_024329). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4342. MGC4701 (Accession XM\_035378) is another VGAM1956 host target gene. MGC4701 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4701 BINDING SITE, designated SEQ ID:32242, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66128] Another function of VGAM1956 is therefore inhibition of MGC4701 (Accession XM\_035378). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4701. MGC9753 (Accession NM\_033419) is another

VGAM1956 host target gene. MGC9753 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC9753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9753 BINDING SITE, designated SEQ ID:27243, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66129] Another function of VGAM1956 is therefore inhibition of MGC9753 (Accession NM\_033419). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9753. MIC2 Like 1 (MIC2L1, Accession NM\_031462) is another VGAM1956 host target gene. MIC2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:25494, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66130] Another function of VGAM1956 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM\_031462). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. Neural Precursor Cell Expressed, Developmentally Down-regulated 5 (NEDD5, Accession NM\_004404) is another VGAM1956 host target gene. NEDD5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD5 BINDING SITE, designated SEQ ID:10658, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66131] Another function of VGAM1956 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 5 (NEDD5, Accession NM\_004404). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD5. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607) is another

VGAM1956 host target gene. PPP1R3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:23860, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66132] Another function of VGAM1956 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B. PRO0971 (Accession NM\_018569) is another VGAM1956 host target gene. PRO0971 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0971 BINDING SITE, designated SEQ ID:20652, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM

RNA, also designated SEQ ID:4667.

[66133] Another function of VGAM1956 is therefore inhibition of PRO0971 (Accession NM\_018569). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0971. Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM\_027679) is another VGAM1956 host target gene. RHOBTB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RHOBTB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB2 BINDING SITE, designated SEQ ID:30562, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66134] Another function of VGAM1956 is therefore inhibition of Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM\_027679). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB2. RNA-binding Region (RNP1, RRM) Containing 1 (RNPC1, Accession NM\_017495) is another VGAM1956 host target gene.

RNPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPC1 BINDING SITE, designated SEQ ID:18959, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66135] Another function of VGAM1956 is therefore inhibition of RNA-binding Region (RNP1, RRM) Containing 1 (RNPC1, Accession NM\_017495). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPC1. Rpo1-2 (Accession NM\_019014) is another VGAM1956 host target gene. Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by Rpo1-2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2, designated SEQ ID:21105 and SEQ ID:25935 respectively, to the

nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66136] Another function of VGAM1956 is therefore inhibition of Rpo1-2 (Accession NM\_019014). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. Serologically Defined Colon Cancer Antigen 3 (SDCCAG3, Accession NM\_006643) is another VGAM1956 host target gene. SDCCAG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDCCAG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG3 BINDING SITE, designated SEQ ID:13435, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66137] Another function of VGAM1956 is therefore inhibition of Serologically Defined Colon Cancer Antigen 3 (SDCCAG3, Accession NM\_006643). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCCAG3. SEC61A1 (Accession NM\_013336) is another

VGAM1956 host target gene. SEC61A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC61A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC61A1 BINDING SITE, designated SEQ ID:14985, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66138] Another function of VGAM1956 is therefore inhibition of SEC61A1 (Accession NM\_013336). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC61A1. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM\_006379) is another VGAM1956 host target gene. SEMA3C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3C BINDING SITE, designated SEQ ID:13074, to the nucleotide sequence of VGAM1956 RNA,

herein designated VGAM RNA, also designated SEQ ID:4667.

[66139] Another function of VGAM1956 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM\_006379). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3C. SERP1 (Accession NM\_014445) is another VGAM1956 host target gene. SERP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERP1 BINDING SITE, designated SEQ ID:15797, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66140] Another function of VGAM1956 is therefore inhibition of SERP1 (Accession NM\_014445). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERP1. SHARP (Accession NM\_015001) is another VGAM1956 host

target gene. SHARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHARP BINDING SITE, designated SEQ ID:17368, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66141] Another function of VGAM1956 is therefore inhibition of SHARP (Accession NM\_015001). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHARP. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_018450) is another VGAM1956 host target gene. SMARCF1 BINDING SITE1 through SMARCF1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCF1 BINDING SITE1 through SMARCF1

BINDING SITE3, designated SEQ ID:20520, SEQ ID:12625 and SEQ ID:29163 respectively, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66142] Another function of VGAM1956 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_018450). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1. Synaptotagmin XIII (SYT13, Accession XM\_167880) is another VGAM1956 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:44892, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66143] Another function of VGAM1956 is therefore inhibition of Synaptotagmin XIII (SYT13, Accession XM\_167880). Ac-

cordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. SZF1 (Accession NM\_016089) is another VGAM1956 host target gene. SZF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SZF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SZF1 BINDING SITE, designated SEQ ID:18174, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66144] Another function of VGAM1956 is therefore inhibition of SZF1 (Accession NM\_016089). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SZF1. Testis Expressed Sequence 27 (TEX27, Accession NM\_021943) is another VGAM1956 host target gene. TEX27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEX27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TEX27 BINDING SITE, designated SEQ ID:22461, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66145] Another function of VGAM1956 is therefore inhibition of Testis Expressed Sequence 27 (TEX27, Accession NM\_021943). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEX27. Tripartite Motif-containing 11 (TRIM11, Accession XM\_052974) is another VGAM1956 host target gene. TRIM11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM11 BINDING SITE, designated SEQ ID:36055, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66146] Another function of VGAM1956 is therefore inhibition of Tripartite Motif-containing 11 (TRIM11, Accession XM\_052974). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with TRIM11. Tripartite Motif-containing 38 (TRIM38, Accession NM\_006355) is another VGAM1956 host target gene. TRIM38 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM38 BINDING SITE, designated SEQ ID:13051, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66147] Another function of VGAM1956 is therefore inhibition of Tripartite Motif-containing 38 (TRIM38, Accession NM\_006355). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM38. Ubiquitin-conjugating Enzyme E2G 1 (UBC7 homolog, *C. elegans*) (UBE2G1, Accession NM\_003342) is another VGAM1956 host target gene. UBE2G1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of UBE2G1 BINDING SITE, designated SEQ ID:9350, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66148] Another function of VGAM1956 is therefore inhibition of Ubiquitin-conjugating Enzyme E2G 1 (UBC7 homolog, *C. elegans*) (UBE2G1, Accession NM\_003342). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2G1. ZFD25 (Accession NM\_016220) is another VGAM1956 host target gene. ZFD25 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZFD25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:18322, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66149] Another function of VGAM1956 is therefore inhibition of ZFD25 (Accession NM\_016220). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25.

Zinc Finger Protein 238 (ZNF238, Accession NM\_006352) is another VGAM1956 host target gene. ZNF238 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF238 BINDING SITE, designated SEQ ID:13045, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66150] Another function of VGAM1956 is therefore inhibition of Zinc Finger Protein 238 (ZNF238, Accession NM\_006352). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF238. LOC124460 (Accession XM\_071892) is another VGAM1956 host target gene. LOC124460 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124460 BINDING SITE, designated SEQ ID:37446, to the nucleotide sequence of

VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66151] Another function of VGAM1956 is therefore inhibition of LOC124460 (Accession XM\_071892). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124460. LOC130412 (Accession XM\_065708) is another VGAM1956 host target gene. LOC130412 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC130412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130412 BINDING SITE, designated SEQ ID:37292, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66152] Another function of VGAM1956 is therefore inhibition of LOC130412 (Accession XM\_065708). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130412. LOC144486 (Accession XM\_096608) is another VGAM1956 host target gene. LOC144486 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC144486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144486 BINDING SITE, designated SEQ ID:40418, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66153] Another function of VGAM1956 is therefore inhibition of LOC144486 (Accession XM\_096608). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144486. LOC145082 (Accession XM\_096719) is another VGAM1956 host target gene. LOC145082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145082 BINDING SITE, designated SEQ ID:40496, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66154] Another function of VGAM1956 is therefore inhibition of LOC145082 (Accession XM\_096719). Accordingly, utilities

of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145082. LOC145622 (Accession XM\_085186) is another VGAM1956 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37914, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66155] Another function of VGAM1956 is therefore inhibition of LOC145622 (Accession XM\_085186). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC145955 (Accession XM\_096912) is another VGAM1956 host target gene. LOC145955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145955 BINDING SITE, designated SEQ ID:40645, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66156] Another function of VGAM1956 is therefore inhibition of LOC145955 (Accession XM\_096912). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145955. LOC146146 (Accession XM\_085343) is another VGAM1956 host target gene. LOC146146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146146 BINDING SITE, designated SEQ ID:38072, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66157] Another function of VGAM1956 is therefore inhibition of LOC146146 (Accession XM\_085343). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146146. LOC146774 (Accession XM\_085584) is another VGAM1956 host target gene. LOC146774 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146774, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146774 BINDING SITE, designated SEQ ID:38236, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66158] Another function of VGAM1956 is therefore inhibition of LOC146774 (Accession XM\_085584). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146774. LOC148254 (Accession XM\_086121) is another VGAM1956 host target gene. LOC148254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148254 BINDING SITE, designated SEQ ID:38504, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66159] Another function of VGAM1956 is therefore inhibition of

LOC148254 (Accession XM\_086121). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148254. LOC148938 (Accession XM\_097555) is another VGAM1956 host target gene. LOC148938 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148938 BINDING SITE, designated SEQ ID:40928, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66160] Another function of VGAM1956 is therefore inhibition of LOC148938 (Accession XM\_097555). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148938. LOC149276 (Accession XM\_097621) is another VGAM1956 host target gene. LOC149276 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC149276 BINDING SITE, designated SEQ ID:40976, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66161] Another function of VGAM1956 is therefore inhibition of LOC149276 (Accession XM\_097621). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149276. LOC149705 (Accession XM\_097711) is another VGAM1956 host target gene. LOC149705 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149705 BINDING SITE, designated SEQ ID:41053, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66162] Another function of VGAM1956 is therefore inhibition of LOC149705 (Accession XM\_097711). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149705. LOC152137 (Accession XM\_087392) is an-

other VGAM1956 host target gene. LOC152137 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152137 BINDING SITE, designated SEQ ID:39222, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66163] Another function of VGAM1956 is therefore inhibition of LOC152137 (Accession XM\_087392). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152137. LOC153811 (Accession XM\_087779) is another VGAM1956 host target gene. LOC153811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:39418, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66164] Another function of VGAM1956 is therefore inhibition of LOC153811 (Accession XM\_087779). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153811. LOC157867 (Accession XM\_098831) is another VGAM1956 host target gene. LOC157867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157867 BINDING SITE, designated SEQ ID:41857, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66165] Another function of VGAM1956 is therefore inhibition of LOC157867 (Accession XM\_098831). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157867. LOC158308 (Accession XM\_098917) is another VGAM1956 host target gene. LOC158308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158308, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158308 BINDING SITE, designated SEQ ID:41941, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66166] Another function of VGAM1956 is therefore inhibition of LOC158308 (Accession XM\_098917). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158308. LOC159121 (Accession XM\_099028) is another VGAM1956 host target gene. LOC159121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159121 BINDING SITE, designated SEQ ID:42063, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66167] Another function of VGAM1956 is therefore inhibition of LOC159121 (Accession XM\_099028). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC159121. LOC162022 (Accession XM\_091293) is another VGAM1956 host target gene. LOC162022 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162022 BINDING SITE, designated SEQ ID:40043, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66168] Another function of VGAM1956 is therefore inhibition of LOC162022 (Accession XM\_091293). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162022. LOC169966 (Accession XM\_093010) is another VGAM1956 host target gene. LOC169966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169966 BINDING SITE, designated SEQ ID:40166, to the nucleotide sequence of VGAM1956 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4667.

[66169] Another function of VGAM1956 is therefore inhibition of LOC169966 (Accession XM\_093010). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169966. LOC196500 (Accession XM\_113734) is another VGAM1956 host target gene. LOC196500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196500 BINDING SITE, designated SEQ ID:42391, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66170] Another function of VGAM1956 is therefore inhibition of LOC196500 (Accession XM\_113734). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196500. LOC199688 (Accession XM\_117115) is another VGAM1956 host target gene. LOC199688 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199688, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199688 BINDING SITE, designated SEQ ID:43230, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66171] Another function of VGAM1956 is therefore inhibition of LOC199688 (Accession XM\_117115). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199688. LOC199699 (Accession XM\_113990) is another VGAM1956 host target gene. LOC199699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199699 BINDING SITE, designated SEQ ID:42596, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66172] Another function of VGAM1956 is therefore inhibition of LOC199699 (Accession XM\_113990). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC199699. LOC199796 (Accession XM\_058994) is another VGAM1956 host target gene. LOC199796 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199796 BINDING SITE, designated SEQ ID:36812, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66173] Another function of VGAM1956 is therefore inhibition of LOC199796 (Accession XM\_058994). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199796. LOC200035 (Accession XM\_055305) is another VGAM1956 host target gene. LOC200035 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200035 BINDING SITE, designated SEQ ID:36263, to

the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66174] Another function of VGAM1956 is therefore inhibition of LOC200035 (Accession XM\_055305). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200035. LOC201707 (Accession XM\_114369) is another VGAM1956 host target gene. LOC201707 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201707 BINDING SITE, designated SEQ ID:42902, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66175] Another function of VGAM1956 is therefore inhibition of LOC201707 (Accession XM\_114369). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201707. LOC202020 (Accession XM\_114419) is another VGAM1956 host target gene. LOC202020 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC202020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202020 BINDING SITE, designated SEQ ID:42953, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66176] Another function of VGAM1956 is therefore inhibition of LOC202020 (Accession XM\_114419). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202020. LOC202934 (Accession XM\_117486) is another VGAM1956 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43464, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66177] Another function of VGAM1956 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities

of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC205085 (Accession XM\_119810) is another VGAM1956 host target gene. LOC205085 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC205085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205085 BINDING SITE, designated SEQ ID:43599, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66178] Another function of VGAM1956 is therefore inhibition of LOC205085 (Accession XM\_119810). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205085. LOC219649 (Accession XM\_167562) is another VGAM1956 host target gene. LOC219649 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC219649 BINDING SITE, designated SEQ ID:44667, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66179] Another function of VGAM1956 is therefore inhibition of LOC219649 (Accession XM\_167562). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219649. LOC220020 (Accession XM\_167821) is another VGAM1956 host target gene. LOC220020 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220020 BINDING SITE, designated SEQ ID:44866, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66180] Another function of VGAM1956 is therefore inhibition of LOC220020 (Accession XM\_167821). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220020. LOC220906 (Accession XM\_166133) is another VGAM1956 host target gene. LOC220906 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220906 BINDING SITE, designated SEQ ID:43927, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66181] Another function of VGAM1956 is therefore inhibition of LOC220906 (Accession XM\_166133). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220906. LOC253758 (Accession XM\_173067) is another VGAM1956 host target gene. LOC253758 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253758 BINDING SITE, designated SEQ ID:46319, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66182] Another function of VGAM1956 is therefore inhibition of

LOC253758 (Accession XM\_173067). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253758. LOC253782 (Accession XM\_171023) is another VGAM1956 host target gene. LOC253782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253782 BINDING SITE, designated SEQ ID:45801, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66183] Another function of VGAM1956 is therefore inhibition of LOC253782 (Accession XM\_171023). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253782. LOC254170 (Accession XM\_170746) is another VGAM1956 host target gene. LOC254170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254170 BINDING SITE, designated SEQ ID:45504, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66184] Another function of VGAM1956 is therefore inhibition of LOC254170 (Accession XM\_170746). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254170. LOC255465 (Accession XM\_173206) is another VGAM1956 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46456, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66185] Another function of VGAM1956 is therefore inhibition of LOC255465 (Accession XM\_173206). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. LOC255520 (Accession XM\_171073) is an-

other VGAM1956 host target gene. LOC255520 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255520 BINDING SITE, designated SEQ ID:45879, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66186] Another function of VGAM1956 is therefore inhibition of LOC255520 (Accession XM\_171073). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255520. LOC54103 (Accession XM\_168508) is another VGAM1956 host target gene. LOC54103 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC54103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54103 BINDING SITE, designated SEQ ID:45207, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66187] Another function of VGAM1956 is therefore inhibition of LOC54103 (Accession XM\_168508). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54103. LOC58525 (Accession XM\_086045) is another VGAM1956 host target gene. LOC58525 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC58525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58525 BINDING SITE, designated SEQ ID:38459, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66188] Another function of VGAM1956 is therefore inhibition of LOC58525 (Accession XM\_086045). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58525. LOC84570 (Accession NM\_032518) is another VGAM1956 host target gene. LOC84570 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC84570, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84570 BINDING SITE, designated SEQ ID:26267, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66189] Another function of VGAM1956 is therefore inhibition of LOC84570 (Accession NM\_032518). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84570. LOC89985 (Accession XM\_027892) is another VGAM1956 host target gene. LOC89985 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89985, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89985 BINDING SITE, designated SEQ ID:30584, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66190] Another function of VGAM1956 is therefore inhibition of LOC89985 (Accession XM\_027892). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC89985. LOC90170 (Accession XM\_029589) is another VGAM1956 host target gene. LOC90170 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90170 BINDING SITE, designated SEQ ID:30911, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66191] Another function of VGAM1956 is therefore inhibition of LOC90170 (Accession XM\_029589). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90170. LOC90408 (Accession XM\_031517) is another VGAM1956 host target gene. LOC90408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:31398, to the nucleotide sequence of VGAM1956 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4667.

[66192] Another function of VGAM1956 is therefore inhibition of LOC90408 (Accession XM\_031517). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408. LOC90509 (Accession XM\_032209) is another VGAM1956 host target gene. LOC90509 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90509 BINDING SITE, designated SEQ ID:31612, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66193] Another function of VGAM1956 is therefore inhibition of LOC90509 (Accession XM\_032209). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90509. LOC90624 (Accession XM\_033003) is another VGAM1956 host target gene. LOC90624 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90624, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90624 BINDING SITE, designated SEQ ID:31816, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66194] Another function of VGAM1956 is therefore inhibition of LOC90624 (Accession XM\_033003). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90624. LOC90625 (Accession XM\_033004) is another VGAM1956 host target gene. LOC90625 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90625 BINDING SITE, designated SEQ ID:31819, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66195] Another function of VGAM1956 is therefore inhibition of LOC90625 (Accession XM\_033004). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC90625. LOC90785 (Accession XM\_034110) is another VGAM1956 host target gene. LOC90785 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90785, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90785 BINDING SITE, designated SEQ ID:32008, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66196] Another function of VGAM1956 is therefore inhibition of LOC90785 (Accession XM\_034110). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90785. LOC91818 (Accession XM\_040878) is another VGAM1956 host target gene. LOC91818 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91818 BINDING SITE, designated SEQ ID:33405, to the

nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66197] Another function of VGAM1956 is therefore inhibition of LOC91818 (Accession XM\_040878). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91818. LOC91948 (Accession XM\_041723) is another VGAM1956 host target gene. LOC91948 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91948 BINDING SITE, designated SEQ ID:33575, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66198] Another function of VGAM1956 is therefore inhibition of LOC91948 (Accession XM\_041723). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91948. LOC92661 (Accession XM\_046465) is another VGAM1956 host target gene. LOC92661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC92661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92661 BINDING SITE, designated SEQ ID:34727, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66199] Another function of VGAM1956 is therefore inhibition of LOC92661 (Accession XM\_046465). Accordingly, utilities of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92661. LOC93626 (Accession XM\_052635) is another VGAM1956 host target gene. LOC93626 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93626, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93626 BINDING SITE, designated SEQ ID:36044, to the nucleotide sequence of VGAM1956 RNA, herein designated VGAM RNA, also designated SEQ ID:4667.

[66200] Another function of VGAM1956 is therefore inhibition of LOC93626 (Accession XM\_052635). Accordingly, utilities

of VGAM1956 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93626. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1957 (VGAM1957) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[66201] VGAM1957 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1957 was detected is described hereinabove with reference to Figs. 1–8.

[66202] VGAM1957 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1957 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[66203] VGAM1957 gene encodes a VGAM1957 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1957 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1957 precursor RNA is designated SEQ ID:1943, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1943 is located at position 5479 relative to the genome of Macaca Mulatta Rhadinovirus.

[66204] VGAM1957 precursor RNA folds onto itself, forming VGAM1957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[66205] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1957 folded precursor RNA into VGAM1957 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1957 RNA is designated SEQ ID:4668, and

is provided hereinbelow with reference to the sequence listing part.

[66206] VGAM1957 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1957 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[66207] VGAM1957 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1957 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1957 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[66208] The complementary binding of VGAM1957 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1957 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1957 host target RNA into VGAM1957 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[66209] It is appreciated that VGAM1957 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1957 host target genes. The mRNA of each one of this plurality of VGAM1957 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1957 RNA, herein designated VGAM RNA, and which when bound by VGAM1957 RNA causes inhibition of translation of respective one or more VGAM1957 host target proteins.

[66210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1957 gene, herein designated VGAM GENE, on one or more VGAM1957 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[66211] It is yet further appreciated that a function of VGAM1957 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1957 correlate with, and may be deduced from, the identity of the host target genes which VGAM1957 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[66212] Nucleotide sequences of the VGAM1957 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1957 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1957 are further described hereinbelow with reference to Table 1.

[66213] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1957 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1957 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[66214] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1957 gene, herein designated VGAM is inhibition of expression of VGAM1957 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1957 correlate with, and may be deduced from, the identity of the target genes which VGAM1957 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[66215] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 4 (ABCB4, Accession NM\_000443) is a VGAM1957 host target gene. ABCB4 BINDING SITE1 and ABCB4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCB4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB4 BINDING SITE1 and ABCB4 BINDING SITE2, designated SEQ ID:6031 and SEQ ID:20836 respectively, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66216] A function of VGAM1957 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 4 (ABCB4, Accession NM\_000443). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ABCB4. Adenylate Kinase 1 (AK1, Accession NM\_000476) is another VGAM1957 host target gene. AK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK1 BINDING SITE, designated SEQ ID:6088, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66217] Another function of VGAM1957 is therefore inhibition of Adenylate Kinase 1 (AK1, Accession NM\_000476). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK1. Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104) is another VGAM1957 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1

and BACE BINDING SITE2, designated SEQ ID:14417 and SEQ ID:29085 respectively, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66218] Another function of VGAM1957 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104), a gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. BCLG (Accession NM\_030766) is another VGAM1957 host target gene. BCLG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCLG BINDING SITE, designated SEQ ID:25051, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66219] Another function of VGAM1957 is therefore inhibition of BCLG (Accession NM\_030766). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCLG. BN51 (BHK21) Temperature Sensitivity Complementing (BN51T, Accession XM\_113557) is another VGAM1957 host target gene. BN51T BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BN51T, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BN51T BINDING SITE, designated SEQ ID:42285, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66220] Another function of VGAM1957 is therefore inhibition of BN51 (BHK21) Temperature Sensitivity Complementing (BN51T, Accession XM\_113557), a gene which complements a temperature-sensitive cell cycle mutation in BHK cells. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BN51T. The function of BN51T and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM592. Cyclin-dependent Kinase Inhibitor 1B (p27, Kip1) (CDKN1B, Accession NM\_004064) is another VGAM1957 host target gene. CDKN1B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDKN1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1B BINDING SITE, designated SEQ ID:10273, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66221] Another function of VGAM1957 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 1B (p27, Kip1) (CDKN1B, Accession NM\_004064), a gene which is involved in g1 arrest and may mediate tgf beta-induced g1 arrest. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN1B. The function of CDKN1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM592. Casein

Kinase 1, Epsilon (CSNK1E, Accession XM\_170996) is another VGAM1957 host target gene. CSNK1E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CSNK1E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1E BINDING SITE, designated SEQ ID:45773, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66222] Another function of VGAM1957 is therefore inhibition of Casein Kinase 1, Epsilon (CSNK1E, Accession XM\_170996), a gene which can phosphorylate a large number of proteins. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1E. The function of CSNK1E has been established by previous studies. Casein kinase I is a member of the serine/threonine protein kinases. In fact, it consists of a family of related enzymes that are monomeric and widely distributed. Fish et al. (1995) cloned a member of the family, which they designated CKI-epsilon, from a human placenta cDNA library. The reading frame predicts a basic protein of 416 amino acids

(43.7 kD) which is most closely related to CKI-delta (OMIM Ref. No. 600864). The authors mapped the gene to 22q12-q13 by fluorescence in situ hybridization. Northern blots showed a major 2.9-kb transcript in all human cell lines examined. Recombinantly expressed enzyme was shown to phosphorylate known CKI substrates and was inhibited by CKI-7, a CKI-specific inhibitor. The human gene was able to rescue yeast with a slow-growth phenotype caused by deletion of HRR25, a yeast CKI locus. Kloss et al. (1998) cloned the double-time (dbt) gene in *Drosophila* and noted that it is most closely related to human casein kinase I-epsilon. *Drosophila* dbtS and dbtL mutations, which alter period length of *Drosophila* circadian rhythms, produce single amino acid changes in conserved regions of the predicted kinase. The dbt mRNA appears to be expressed in the same cell types as are *Drosophila* 'per' (OMIM Ref. No. 602260) and 'tim.' Dbt is capable of binding to per in vitro and in *Drosophila* cells, suggesting that a physical association of per and dbt regulates per phosphorylation and accumulation in vivo

[66223] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [66224] Fish, K. J.; Cegielska, A.; Getman, M. E.; Landes, G. M.; Virshup, D. M. : Isolation and characterization of human casein kinase I-epsilon (CKI), a novel member of the CKI gene family. J. Biol. Chem. 270: 14875-14883, 1995. ; and
- [66225] Kloss, B.; Price, J. L.; Saez, L.; Blau, J.; Rothenfluh, A.; Wesley, C. S.; Young, M. W. : The Drosophila clock gene double-time encodes a protein closely-related to human casein kinase.
- [66226] Further studies establishing the function and utilities of CSNK1E are found in John Hopkins OMIM database record ID 600863, and in cited publications numbered 7013-7015 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM\_166434) is another VGAM1957 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44331, to the nucleotide sequence of

VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66227] Another function of VGAM1957 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM\_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Deoxycytidine Kinase (DCK, Accession NM\_000788) is another VGAM1957 host target gene. DCK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCK BINDING SITE, designated SEQ ID:6441, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66228] Another function of VGAM1957 is therefore inhibition of Deoxycytidine Kinase (DCK, Accession NM\_000788), a

gene which mediates the phosphorylation of several deoxyribonucleosides and their analogs. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCK. The function of DCK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Death Effector Domain Containing (DEDD, Accession NM\_032998) is another VGAM1957 host target gene. DEDD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DEDD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEDD BINDING SITE, designated SEQ ID:26881, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66229] Another function of VGAM1957 is therefore inhibition of Death Effector Domain Containing (DEDD, Accession NM\_032998), a gene which intervenes in apoptosis. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with DEDD. The function of DEDD and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1189.DNA

(cytosine-5-)-methyltransferase 2 (DNMT2, Accession NM\_004412) is another VGAM1957 host target gene.

DNMT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DNMT2 BINDING SITE, designated SEQ

ID:10671, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ

ID:4668.

[66230] Another function of VGAM1957 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 2 (DNMT2, Accession NM\_004412), a gene which may mark specific sequences in the genome . Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT2. The function of DNMT2 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM177. Down Syndrome Critical Region Gene 4 (DSCR4, Accession NM\_005867) is another VGAM1957 host target gene. DSCR4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR4 BINDING SITE, designated SEQ ID:12488, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66231] Another function of VGAM1957 is therefore inhibition of Down Syndrome Critical Region Gene 4 (DSCR4, Accession NM\_005867). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR4. G Protein-coupled Receptor 81 (GPR81, Accession NM\_032554) is another VGAM1957 host target gene. GPR81 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR81, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:12489, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

tarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:26279, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66232] Another function of VGAM1957 is therefore inhibition of G Protein-coupled Receptor 81 (GPR81, Accession NM\_032554). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR81. Glutathione S-transferase M5 (GSTM5, Accession NM\_000851) is another VGAM1957 host target gene. GSTM5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GSTM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GSTM5 BINDING SITE, designated SEQ ID:6519, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66233] Another function of VGAM1957 is therefore inhibition of Glutathione S-transferase M5 (GSTM5, Accession NM\_000851), a gene which conjugates reduced glutathione to a wide number of exogenous and endogenous

hydrophobic electrophiles. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GSTM5. The function of GSTM5 has been established by previous studies. The glutathione S-transferases (GSTs) are dimeric enzymes that metabolize a broad range of xenobiotics and carcinogens. They are encoded by several multigene families. See GSTM1 (OMIM Ref. No. 138350) for additional background. By screening a human frontal cortex cDNA library with a rat cDNA that cross-hybridized with other rodent and human mu class GST cDNAs, Takahashi et al. (1993) isolated a cDNA encoding GSTM5. Northern blot analysis revealed that GSTM5 is expressed primarily in brain and lung and to a lesser extent in heart. The GSTM5 gene encodes a predicted 217-amino acid protein. By Western blot analysis using antibodies against the unique C-terminal region of GSTM5, Takahashi et al. (1993) detected GSTM5 in brain and testis but not liver.

[66234] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66235] Pearson, W. R.; Vorachek, W. R.; Xu, S.; Berger, R.; Hart, I.; Vannais, D.; Patterson, D. : Identification of class-mu glu-

tathione transferase genes GSTM1–GSTM5 on human chromosome 1p13. Am. J. Hum. Genet. 53: 220–233, 1993. ; and

[66236] Takahashi, Y.; Campbell, E. A.; Hirata, Y.; Takayama, T.; Listowsky, I. : A basis for differentiating among the multiple human mu–glutathione S–transferases and molecular cloning of bra.

[66237] Further studies establishing the function and utilities of GSTM5 are found in John Hopkins OMIM database record ID 138385, and in cited publications numbered 3730 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Huntingtin (Huntington disease) (HD, Accession NM\_002111) is another VGAM1957 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7896, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66238] Another function of VGAM1957 is therefore inhibition of

Huntingtin (Huntington disease) (HD, Accession NM\_002111). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. Homeo Box B9 (HOXB9, Accession NM\_024017) is another VGAM1957 host target gene. HOXB9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB9 BINDING SITE, designated SEQ ID:23447, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66239] Another function of VGAM1957 is therefore inhibition of Homeo Box B9 (HOXB9, Accession NM\_024017). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB9. HTRA3 (Accession XM\_114416) is another VGAM1957 host target gene. HTRA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:42938, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66240] Another function of VGAM1957 is therefore inhibition of HTRA3 (Accession XM\_114416). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTRA3. Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM\_012275) is another VGAM1957 host target gene. IL1F5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1F5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BINDING SITE, designated SEQ ID:14604, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66241] Another function of VGAM1957 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM\_012275), a gene which is a novel interleukin-1 receptor antagonist gene. Accordingly, utilities of VGAM1957

include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263. Potassium Voltage-gated Channel, KQT-like Subfamily, Member 3 (KCNQ3, Accession NM\_004519) is another VGAM1957 host target gene. KCNQ3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNQ3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNQ3 BINDING SITE, designated SEQ ID:10847, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66242] Another function of VGAM1957 is therefore inhibition of Potassium Voltage-gated Channel, KQT-like Subfamily, Member 3 (KCNQ3, Accession NM\_004519), a gene which probably important in the regulation of neuronal excitability. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNQ3. The function of

KCNQ3 has been established by previous studies. The KQT-like family is a family of voltage-gated potassium channels. The first human gene belonging to this family to be identified was that responsible for chromosome-11 long QT syndrome and the Jervell and Lange-Nielsen cardioauditory syndrome (KCNQ1; 192500). The second to be identified (KCNQ2; 602235) was the gene mutated in the chromosome-20 form of benign neonatal epilepsy (EBN1; 121200). To identify new members of that family, possibly implicated in other forms of idiopathic generalized epilepsy, Charlier et al. (1998) conducted a tBLASTx search with the KCNQ2 full-length cDNA against the expressed sequence tag (EST) database. In this way they identified a new gene, designated KCNQ3. They mapped the gene to chromosome 8 by analysis of a somatic cell hybrid panel and refined the assignment by analysis of radiation hybrids, which showed tight linkage of KCNQ3 to markers previously mapped to 8q24. The KCNQ3 gene was localized to the interval defined by markers previously linked to a family with chromosome-8 benign neonatal epilepsy (EBN2; 121201). Charlier et al. (1998) then sought mutations in the KCNQ3 gene in a member of a phenotypically well-characterized 3-generation Mexican-

American family affected with BFNC2 reported by Ryan et al. (1991). They identified a single heterozygous missense mutation, glycine (GGC) to valine (GTC), in position 263 of the highly conserved pore region. The same glycine had been found to be mutated in KCNQ1 (gly177arg) in a patient with long QT syndrome (192500.0001). Defects in the KCNQ genes cause human disorders associated with altered regulation of excitability. KCNQ1 is expressed in the heart and inner ear; KCNQ2 and KCNQ3 are expressed in the brain Cooper et al. (2000) provided information regarding the in vivo distribution and biochemical characteristics of human brain KCNQ2 and KCNQ3, the 2 channel subunits that form M-channels when expressed in vitro, and, when mutated, cause the dominantly inherited epileptic syndrome, benign familial neonatal convulsions. They found that the KCNQ2 and KCNQ3 proteins are colocalized in a somatodendritic pattern on pyramidal and polymorphic neurons in the human cortex and hippocampus. Immunoreactivity for KCNQ2, but not KCNQ3, is also prominent in some terminal fields, suggesting a presynaptic role for a distinct subgroup of M-channels in the regulation of action potential propagation and neurotransmitter release. KCNQ2 and KCNQ3 could be coim-

munoprecipitated from brain lysates. Further, both proteins were coassociated with tubulin (see OMIM Ref. No. 602529) and protein kinase A (see OMIM Ref. No. 176911) within a triton X-100-insoluble protein complex. Cooper et al. (2000) suggested that these studies provided a view of a signaling complex that may be important for cognitive function as well as epilepsy, and that analysis of this complex may shed light on the transduction pathway linking muscarinic acetylcholine receptor (see OMIM Ref. No. 118510) activation to M-channel inhibition.

[66243] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66244] Cooper, E. C.; Aldape, K. D.; Abosch, A.; Barbaro, N. M.; Berger, M. S.; Peacock, W. S.; Jan, Y. N.; Jan, L. Y. : Colocalization and coassembly of two human brain M-type potassium channel subunits that are mutated in epilepsy. Proc. Nat. Acad. Sci. 97: 4914-4919, 2000. ; and

[66245] Charlier, C.; Singh, N. A.; Ryan, S. G.; Lewis, T. B.; Reus, B. E.; Leach, R. J.; Leppert, M. : A pore mutation in a novel KQT-like potassium channel gene in an idiopathic epilepsy fami.

[66246] Further studies establishing the function and utilities of

KCNQ3 are found in John Hopkins OMIM database record ID 602232, and in cited publications numbered 4664, 628 and 6290–6291 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Potassium Voltage–gated Channel, Delayed–rectifier, Subfamily S, Member 2 (KCNS2, Accession XM\_043106) is another VGAM1957 host target gene. KCNS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS2 BINDING SITE, designated SEQ ID:33898, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66247] Another function of VGAM1957 is therefore inhibition of Potassium Voltage–gated Channel, Delayed–rectifier, Subfamily S, Member 2 (KCNS2, Accession XM\_043106), a gene which mediates the voltage–dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS2. The function of KCNS2 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419. Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM\_014622) is another VGAM1957 host target gene. LOH11CR2A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOH11CR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOH11CR2A BINDING SITE, designated SEQ ID:15989, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66248] Another function of VGAM1957 is therefore inhibition of Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM\_014622). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOH11CR2A. V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog F (avian) (MAFF, Accession NM\_012323) is another VGAM1957 host target gene. MAFF BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by MAFF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAFF BINDING SITE, designated SEQ ID:14702, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66249] Another function of VGAM1957 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog F (avian) (MAFF, Accession NM\_012323), a gene which Binds to the US-2 motif of the oxytocin receptor gene; has a leucine zipper structure. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAFF. The function of MAFF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1928. Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM\_139012) is another VGAM1957 host target gene. MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK14, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3, designated SEQ ID:29108, SEQ ID:7004 and SEQ ID:29115 respectively, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66250] Another function of VGAM1957 is therefore inhibition of Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM\_139012), a gene which is important for cytokine production; responds to changes in extracellular osmolarity. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK14. The function of MAPK14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. MAX Protein (MAX, Accession NM\_145112) is another VGAM1957 host target gene. MAX BINDING SITE1 through MAX BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MAX BINDING SITE1 through MAX BINDING SITE4, designated SEQ ID:29717, SEQ ID:29719, SEQ ID:29722 and SEQ ID:22487 respectively, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66251] Another function of VGAM1957 is therefore inhibition of MAX Protein (MAX, Accession NM\_145112), a gene which interacts specifically with the MYC (190080) protein . Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAX. The function of MAX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923. Procollagen C-endopeptidase Enhancer 2 (PCOLCE2, Accession NM\_013363) is another VGAM1957 host target gene. PCOLCE2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCOLCE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCOLCE2 BINDING SITE, designated SEQ ID:15009, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66252] Another function of VGAM1957 is therefore inhibition of Procollagen C-endopeptidase Enhancer 2 (PCOLCE2, Accession NM\_013363), a gene which binds to the cooh-

terminal propeptide of type I procollagen and enhances procollagen C-proteinase activity. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCOLCE2. The function of PCOLCE2 has been established by previous studies. Xu et al. (2000) cloned PCOLCE2 from trabecular meshwork cell mRNA followed by 5-prime RACE. The deduced 415-amino acid protein contains an N-terminal signal sequence, 2 CUB domains, and an NTR domain. It also contains a putative myristoylation site, several potential phosphorylation sites, a putative glycosylation site, and an RGD site. PCOLCE2 shares about 43% sequence identity with the PCOLCE protein (OMIM Ref. No. 600270). The secreted PCOLCE2 protein is calculated to have a molecular mass of about 47 kD. Northern blot analysis detected ubiquitous expression of a 2-kb transcript, with highest expression in heart, placenta, and trabecular meshwork, and very low expression in brain. Western blot analysis revealed a 52-kD form of PCOLCE2 in human fibroblast cells. Xu et al. (2000) identified the PCOLCE2 sequence within an EST mapped to chromosome 3q21-q24. Steiglitiz and Greenspan (2001) noted identity between the PCOLCE2 sequence and the sequence of a

BAC clone mapped to 3q23. They found that PCOLCE2 lies 5.2 kb and 102.5 kb centromeric to the transient receptor potential channel-1 (TRPC1; 602343) and plastin-1 (PLS1; 602734), respectively. By radiation hybrid analysis, they mapped the mouse gene to chromosome 9.

[66253] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66254] Steiglitz, B. M.; Greenspan, D. S. : Assignment of the mouse Pcolce2 gene, which encodes procollagen C-proteinase enhancer protein 2, to chromosome 9 and localization of PCOLCE2 to human chromosome 3q23. Cytogenet. Cell Genet. 95: 244-245, 2001. ; and

[66255] Xu, H.; Acott, T. S.; Wirtz, M. K. : Identification and expression of a novel type I procollagen C-proteinase enhancer protein gene from the glaucoma candidate region on 3q21-q24. Geno.

[66256] Further studies establishing the function and utilities of PCOLCE2 are found in John Hopkins OMIM database record ID 607064, and in cited publications numbered 5133-5134 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase, EF Hand Calcium-binding Domain 2 (PPEF2,

Accession NM\_006239) is another VGAM1957 host target gene. PPEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPEF2 BINDING SITE, designated SEQ ID:12904, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66257] Another function of VGAM1957 is therefore inhibition of Protein Phosphatase, EF Hand Calcium-binding Domain 2 (PPEF2, Accession NM\_006239), a gene which is a homolog of *Drosophila* rdgC. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPEF2. The function of PPEF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1466. RAB3A, Member RAS Oncogene Family (RAB3A, Accession NM\_002866) is another VGAM1957 host target gene. RAB3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3A, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3A BINDING SITE, designated SEQ ID:8770, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66258] Another function of VGAM1957 is therefore inhibition of RAB3A, Member RAS Oncogene Family (RAB3A, Accession NM\_002866), a gene which is involved in exocytosis, by regulating a late step in synaptic vesicle fusion. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3A. The function of RAB3A has been established by previous studies. The RAS gene superfamily is divided into 3 main branches according to protein homology. In mammals the first branch includes the classic RAS genes as well as RAL (OMIM Ref. No. 179550) and RRAS (OMIM Ref. No. 165090). The RHO genes (165370, 165380, 165390) belong to the second branch and the RAB genes to the third. The RAB genes were so named because they were first isolated from a rat brain library. Zahraoui et al. (1989) isolated cDNAs encoding RAB3A and several other human RAB proteins. See RAB5A (OMIM

Ref. No. 179512). The predicted 220–amino acid human RAB3A protein shares 99% and 78% identity with rat Rab3A and human RAB3B (OMIM Ref. No. 179510), respectively. Animal model experiments lend further support to the function of RAB3A. In brain, RAB3A is found specifically in synaptic vesicles. Geppert et al. (1997) generated Rab3A–deficient mice. They found that the size of the readily releasable pool of vesicles was normal, but that calcium–triggered fusion was altered in the absence of Rab3A such that a greater number of exocytic events occurred within a brief time after arrival of the nerve impulse. They concluded that Rab3A regulates a late step in synaptic vesicle fusion.

[66259] It is appreciated that the abovementioned animal model for RAB3A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[66260] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66261] Zahraoui, A.; Touchot, N.; Chardin, P.; Tavitian, A. : The human rab genes encode a family of GTP–binding proteins related to yeast YPT1 and SEC4 products involved in se–

cretion. J. Biol. Chem. 264: 12394–12401, 1989. ; and

[66262] Geppert, M.; Goda, Y.; Stevens, C. F.; Sudhof, T. C. : The small GTP-binding protein Rab3A regulates a late step in synaptic vesicle fusion. Nature 387: 810–814, 1997.

[66263] Further studies establishing the function and utilities of RAB3A are found in John Hopkins OMIM database record ID 179490, and in cited publications numbered 2718–272 and 5126 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinoid X Receptor, Alpha (RXRA, Accession NM\_002957) is another VGAM1957 host target gene. RXRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RXRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RXRA BINDING SITE, designated SEQ ID:8871, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66264] Another function of VGAM1957 is therefore inhibition of Retinoid X Receptor, Alpha (RXRA, Accession NM\_002957), a gene which activates genes required for vitamin A metabolism, binds 9-cis retinoic acid. Accordingly, utili-

ties of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RXRA. The function of RXRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349. TEM6 (Accession NM\_022748) is another VGAM1957 host target gene. TEM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM6 BINDING SITE, designated SEQ ID:22960, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66265] Another function of VGAM1957 is therefore inhibition of TEM6 (Accession NM\_022748), a gene which displays elevated expression during tumor angiogenesis. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM6. The function of TEM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM175.Tumor Protein D52-like 2 (TPD52L2, Accession NM\_003288) is another VGAM1957 host target gene. TPD52L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPD52L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPD52L2 BINDING SITE, designated SEQ ID:9298, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66266] Another function of VGAM1957 is therefore inhibition of Tumor Protein D52-like 2 (TPD52L2, Accession NM\_003288). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPD52L2. Tripartite Motif-containing 34 (TRIM34, Accession NM\_021616) is another VGAM1957 host target gene. TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRIM34, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2, designated SEQ ID:22251 and SEQ ID:28175 respectively, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66267] Another function of VGAM1957 is therefore inhibition of Tripartite Motif-containing 34 (TRIM34, Accession NM\_021616). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM34. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_014919) is another VGAM1957 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:17177, SEQ ID:28458 and SEQ ID:9448 respectively, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66268] Another function of VGAM1957 is therefore inhibition of

Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_014919), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577) is another VGAM1957 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31076, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66269] Another function of VGAM1957 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with ATP9A. Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698) is another VGAM1957 host target gene. BLCAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BLCAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLCAP BINDING SITE, designated SEQ ID:13519, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66270] Another function of VGAM1957 is therefore inhibition of Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLCAP. Bromodomain Containing 4 (BRD4, Accession NM\_058243) is another VGAM1957 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD4 BINDING SITE,

designated SEQ ID:27774, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66271] Another function of VGAM1957 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession NM\_058243). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM\_020248) is another VGAM1957 host target gene. CTNNBIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTNNBIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNBIP1 BINDING SITE, designated SEQ ID:21544, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66272] Another function of VGAM1957 is therefore inhibition of Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM\_020248). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNBIP1. DKFZP566K1924

(Accession XM\_057469) is another VGAM1957 host target gene. DKFZP566K1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566K1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K1924 BINDING SITE, designated SEQ ID:36517, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66273] Another function of VGAM1957 is therefore inhibition of DKFZP566K1924 (Accession XM\_057469). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K1924. DKFZP667O116 (Accession XM\_168586) is another VGAM1957 host target gene. DKFZP667O116 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP667O116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP667O116 BINDING SITE, designated SEQ ID:45265, to the nucleotide sequence of

VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66274] Another function of VGAM1957 is therefore inhibition of DKFZP667O116 (Accession XM\_168586). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP667O116. FBX30 (Accession NM\_033182) is another VGAM1957 host target gene. FBX30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBX30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBX30 BINDING SITE, designated SEQ ID:27041, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66275] Another function of VGAM1957 is therefore inhibition of FBX30 (Accession NM\_033182). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBX30. FLJ10079 (Accession XM\_012540) is another VGAM1957 host target gene. FLJ10079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ10079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10079 BINDING SITE, designated SEQ ID:30216, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66276] Another function of VGAM1957 is therefore inhibition of FLJ10079 (Accession XM\_012540). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10079. FLJ11164 (Accession NM\_018346) is another VGAM1957 host target gene. FLJ11164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11164 BINDING SITE, designated SEQ ID:20357, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66277] Another function of VGAM1957 is therefore inhibition of FLJ11164 (Accession NM\_018346). Accordingly, utilities of

VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11164. FLJ11506 (Accession NM\_024666) is another VGAM1957 host target gene. FLJ11506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11506 BINDING SITE, designated SEQ ID:23969, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66278] Another function of VGAM1957 is therefore inhibition of FLJ11506 (Accession NM\_024666). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11506. FLJ11715 (Accession NM\_024564) is another VGAM1957 host target gene. FLJ11715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11715

BINDING SITE, designated SEQ ID:23788, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66279] Another function of VGAM1957 is therefore inhibition of FLJ11715 (Accession NM\_024564). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11715. FLJ12783 (Accession NM\_031426) is another VGAM1957 host target gene. FLJ12783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12783 BINDING SITE, designated SEQ ID:25419, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66280] Another function of VGAM1957 is therefore inhibition of FLJ12783 (Accession NM\_031426). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12783. FLJ14146 (Accession NM\_024709) is another VGAM1957 host target gene. FLJ14146 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:24030, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66281] Another function of VGAM1957 is therefore inhibition of FLJ14146 (Accession NM\_024709). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146. FLJ20034 (Accession NM\_017630) is another VGAM1957 host target gene. FLJ20034 BINDING SITE1 and FLJ20034 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20034, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE1 and FLJ20034 BINDING SITE2, designated SEQ ID:19135 and SEQ ID:19136 respectively, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4668.

[66282] Another function of VGAM1957 is therefore inhibition of FLJ20034 (Accession NM\_017630). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. FLJ20312 (Accession NM\_017761) is another VGAM1957 host target gene. FLJ20312 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20312 BINDING SITE, designated SEQ ID:19374, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66283] Another function of VGAM1957 is therefore inhibition of FLJ20312 (Accession NM\_017761). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20312. FLJ20378 (Accession NM\_017795) is another VGAM1957 host target gene. FLJ20378 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20378, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20378 BINDING SITE, designated SEQ ID:19437, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66284] Another function of VGAM1957 is therefore inhibition of FLJ20378 (Accession NM\_017795). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20378. FLJ20400 (Accession XM\_039306) is another VGAM1957 host target gene. FLJ20400 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20400 BINDING SITE, designated SEQ ID:33046, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66285] Another function of VGAM1957 is therefore inhibition of FLJ20400 (Accession XM\_039306). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20400. FLJ20574 (Accession NM\_017886) is another VGAM1957 host target gene. FLJ20574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20574 BINDING SITE, designated SEQ ID:19555, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66286] Another function of VGAM1957 is therefore inhibition of FLJ20574 (Accession NM\_017886). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20574. FLJ22833 (Accession NM\_022837) is another VGAM1957 host target gene. FLJ22833 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22833 BINDING SITE, designated SEQ ID:23122, to the nucleotide

sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66287] Another function of VGAM1957 is therefore inhibition of FLJ22833 (Accession NM\_022837). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22833. FLJ23277 (Accession NM\_032236) is another VGAM1957 host target gene. FLJ23277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23277 BINDING SITE, designated SEQ ID:25955, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66288] Another function of VGAM1957 is therefore inhibition of FLJ23277 (Accession NM\_032236). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23277. Glucocorticoid Modulatory Element Binding Protein 2 (GMEB2, Accession NM\_012384) is another VGAM1957 host target gene. GMEB2 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GMEB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMEB2 BINDING SITE, designated SEQ ID:14739, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66289] Another function of VGAM1957 is therefore inhibition of Glucocorticoid Modulatory Element Binding Protein 2 (GMEB2, Accession NM\_012384). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMEB2. G Protein Pathway Suppressor 2 (GPS2, Accession NM\_004489) is another VGAM1957 host target gene. GPS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPS2 BINDING SITE, designated SEQ ID:10827, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66290] Another function of VGAM1957 is therefore inhibition of G Protein Pathway Suppressor 2 (GPS2, Accession NM\_004489). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPS2. HSGP25L2G (Accession XM\_030771) is another VGAM1957 host target gene. HSGP25L2G BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSGP25L2G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSGP25L2G BINDING SITE, designated SEQ ID:31135, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66291] Another function of VGAM1957 is therefore inhibition of HSGP25L2G (Accession XM\_030771). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSGP25L2G. KIAA0082 (Accession XM\_166400) is another VGAM1957 host target gene. KIAA0082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0082, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0082 BINDING SITE, designated SEQ ID:44262, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66292] Another function of VGAM1957 is therefore inhibition of KIAA0082 (Accession XM\_166400). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0082. KIAA0092 (Accession NM\_014679) is another VGAM1957 host target gene. KIAA0092 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0092 BINDING SITE, designated SEQ ID:16155, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66293] Another function of VGAM1957 is therefore inhibition of KIAA0092 (Accession NM\_014679). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0092. KIAA0232 (Accession XM\_052627) is another VGAM1957 host target gene. KIAA0232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:36037, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66294] Another function of VGAM1957 is therefore inhibition of KIAA0232 (Accession XM\_052627). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232. KIAA0275 (Accession NM\_014767) is another VGAM1957 host target gene. KIAA0275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0275 BINDING SITE, designated SEQ ID:16554, to the

nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66295] Another function of VGAM1957 is therefore inhibition of KIAA0275 (Accession NM\_014767). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0275. KIAA0321 (Accession XM\_031077) is another VGAM1957 host target gene. KIAA0321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0321 BINDING SITE, designated SEQ ID:31270, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66296] Another function of VGAM1957 is therefore inhibition of KIAA0321 (Accession XM\_031077). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0321. KIAA0418 (Accession NM\_014631) is another VGAM1957 host target gene. KIAA0418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0418 BINDING SITE, designated SEQ ID:15995, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66297] Another function of VGAM1957 is therefore inhibition of KIAA0418 (Accession NM\_014631). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0418. KIAA0427 (Accession NM\_014772) is another VGAM1957 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16580, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66298] Another function of VGAM1957 is therefore inhibition of KIAA0427 (Accession NM\_014772). Accordingly, utilities

of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. KIAA0478 (Accession NM\_014870) is another VGAM1957 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16983, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66299] Another function of VGAM1957 is therefore inhibition of KIAA0478 (Accession NM\_014870). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA0522 (Accession XM\_050404) is another VGAM1957 host target gene. KIAA0522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0522 BINDING SITE, designated SEQ ID:35625, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66300] Another function of VGAM1957 is therefore inhibition of KIAA0522 (Accession XM\_050404). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0522. KIAA0537 (Accession NM\_014840) is another VGAM1957 host target gene. KIAA0537 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0537 BINDING SITE, designated SEQ ID:16862, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66301] Another function of VGAM1957 is therefore inhibition of KIAA0537 (Accession NM\_014840). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0537. KIAA0652 (Accession NM\_014741) is another VGAM1957 host target gene. KIAA0652 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0652 BINDING SITE, designated SEQ ID:16406, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66302] Another function of VGAM1957 is therefore inhibition of KIAA0652 (Accession NM\_014741). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0652. KIAA1274 (Accession XM\_166125) is another VGAM1957 host target gene. KIAA1274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1274 BINDING SITE, designated SEQ ID:43913, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66303] Another function of VGAM1957 is therefore inhibition of

KIAA1274 (Accession XM\_166125). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1274. KIAA1297 (Accession XM\_051005) is another VGAM1957 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35707, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66304] Another function of VGAM1957 is therefore inhibition of KIAA1297 (Accession XM\_051005). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KIAA1522 (Accession XM\_036299) is another VGAM1957 host target gene. KIAA1522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:32419, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66305] Another function of VGAM1957 is therefore inhibition of KIAA1522 (Accession XM\_036299). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1522. KIAA1560 (Accession XM\_034422) is another VGAM1957 host target gene. KIAA1560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1560 BINDING SITE, designated SEQ ID:32104, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66306] Another function of VGAM1957 is therefore inhibition of KIAA1560 (Accession XM\_034422). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1560. KIAA1580 (Accession XM\_045271) is another

VGAM1957 host target gene. KIAA1580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1580 BINDING SITE, designated SEQ ID:34408, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66307] Another function of VGAM1957 is therefore inhibition of KIAA1580 (Accession XM\_045271). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1580. KIAA1649 (Accession XM\_040095) is another VGAM1957 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:33258, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66308] Another function of VGAM1957 is therefore inhibition of KIAA1649 (Accession XM\_040095). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. KIAA1691 (Accession XM\_166523) is another VGAM1957 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44462, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66309] Another function of VGAM1957 is therefore inhibition of KIAA1691 (Accession XM\_166523). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. KIAA1826 (Accession XM\_040784) is another VGAM1957 host target gene. KIAA1826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1826, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1826 BINDING SITE, designated SEQ ID:33377, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66310] Another function of VGAM1957 is therefore inhibition of KIAA1826 (Accession XM\_040784). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1826. KIAA1831 (Accession XM\_033366) is another VGAM1957 host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:31906, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66311] Another function of VGAM1957 is therefore inhibition of KIAA1831 (Accession XM\_033366). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1831. MGC3248 (Accession NM\_032486) is another VGAM1957 host target gene. MGC3248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3248 BINDING SITE, designated SEQ ID:26240, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66312] Another function of VGAM1957 is therefore inhibition of MGC3248 (Accession NM\_032486). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248. MGC4549 (Accession NM\_032377) is another VGAM1957 host target gene. MGC4549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4549 BINDING SITE, designated SEQ ID:26172, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM

RNA, also designated SEQ ID:4668.

[66313] Another function of VGAM1957 is therefore inhibition of MGC4549 (Accession NM\_032377). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4549. MGC4655 (Accession NM\_033309) is another VGAM1957 host target gene. MGC4655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4655 BINDING SITE, designated SEQ ID:27146, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66314] Another function of VGAM1957 is therefore inhibition of MGC4655 (Accession NM\_033309). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4655. N4BP3 (Accession XM\_038920) is another VGAM1957 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by N4BP3, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32937, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66315] Another function of VGAM1957 is therefore inhibition of N4BP3 (Accession XM\_038920). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. poly(A) Polymerase Gamma (PAPOLG, Accession NM\_022894) is another VGAM1957 host target gene. PAPOLG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAPOLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAPOLG BINDING SITE, designated SEQ ID:23154, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66316] Another function of VGAM1957 is therefore inhibition of poly(A) Polymerase Gamma (PAPOLG, Accession

NM\_022894). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAPOLG. PR Domain Containing 10 (PRDM10, Accession NM\_020228) is another VGAM1957 host target gene. PRDM10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM10 BINDING SITE, designated SEQ ID:21497, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66317] Another function of VGAM1957 is therefore inhibition of PR Domain Containing 10 (PRDM10, Accession NM\_020228). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM10. PRTD-NY3 (Accession NM\_030924) is another VGAM1957 host target gene. PRTD-NY3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRTD-NY3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRTD-NY3 BINDING SITE, designated SEQ ID:25194, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66318] Another function of VGAM1957 is therefore inhibition of PRTD-NY3 (Accession NM\_030924). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRTD-NY3. RAB10, Member RAS Oncogene Family (RAB10, Accession XM\_097979) is another VGAM1957 host target gene. RAB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB10 BINDING SITE, designated SEQ ID:41281, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66319] Another function of VGAM1957 is therefore inhibition of RAB10, Member RAS Oncogene Family (RAB10, Accession XM\_097979). Accordingly, utilities of VGAM1957 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB10. RAS Protein Activator Like 2 (RASAL2, Accession NM\_004841) is another VGAM1957 host target gene. RASAL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASAL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASAL2 BINDING SITE, designated SEQ ID:11250, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66320] Another function of VGAM1957 is therefore inhibition of RAS Protein Activator Like 2 (RASAL2, Accession NM\_004841). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASAL2. RAS Guanyl Releasing Protein 4 (RASGRP4, Accession NM\_052949) is another VGAM1957 host target gene. RASGRP4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RASGRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of RASGRP4 BINDING SITE, designated SEQ ID:27505, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66321] Another function of VGAM1957 is therefore inhibition of RAS Guanyl Releasing Protein 4 (RASGRP4, Accession NM\_052949). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP4. RNA Binding Protein S1, Serine-rich Domain (RNPS1, Accession NM\_080594) is another VGAM1957 host target gene. RNPS1 BINDING SITE1 and RNPS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RNPS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPS1 BINDING SITE1 and RNPS1 BINDING SITE2, designated SEQ ID:27902 and SEQ ID:13537 respectively, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66322] Another function of VGAM1957 is therefore inhibition of RNA Binding Protein S1, Serine-rich Domain (RNPS1, Ac-

cession NM\_080594). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNPS1. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM\_012431) is another VGAM1957 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:14808, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66323] Another function of VGAM1957 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM\_012431). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. Sialyltransferase 8A (alpha-N-acetylneuraminate: alpha-2,8-sialyltransferase, GD3 synthase) (SIAT8A, Accession

NM\_003034) is another VGAM1957 host target gene. SIAT8A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SIAT8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8A BINDING SITE, designated SEQ ID:8983, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66324] Another function of VGAM1957 is therefore inhibition of Sialyltransferase 8A (alpha-N-acetylneuraminate: alpha-2,8-sialyltransferase, GD3 synthase) (SIAT8A, Accession NM\_003034). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8A. Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM\_003131) is another VGAM1957 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9103, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66325] Another function of VGAM1957 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM\_003131). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. Serine/threonine Kinase 38 Like (STK38L, Accession XM\_044823) is another VGAM1957 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34286, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66326] Another function of VGAM1957 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM\_044823). Accordingly, utilities of VGAM1957 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. Sulfotransferase Family, Cytosolic, 1C, Member 2 (SULT1C2, Accession NM\_006588) is another VGAM1957 host target gene. SULT1C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SULT1C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C2 BINDING SITE, designated SEQ ID:13354, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66327] Another function of VGAM1957 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 2 (SULT1C2, Accession NM\_006588). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C2. Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession NM\_080737) is another VGAM1957 host target gene. SYTL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SYTL4, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYTL4 BINDING SITE, designated SEQ ID:28023, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66328] Another function of VGAM1957 is therefore inhibition of Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession NM\_080737). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL4. T-box 21 (TBX21, Accession NM\_013351) is another VGAM1957 host target gene. TBX21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBX21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX21 BINDING SITE, designated SEQ ID:14995, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66329] Another function of VGAM1957 is therefore inhibition of T-box 21 (TBX21, Accession NM\_013351). Accordingly,

utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX21. TPRA40 (Accession NM\_016372) is another VGAM1957 host target gene. TPRA40 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TPRA40, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPRA40 BINDING SITE, designated SEQ ID:18502, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66330] Another function of VGAM1957 is therefore inhibition of TPRA40 (Accession NM\_016372). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPRA40. UDP-glucuronate Decarboxylase 1 (UXS1, Accession NM\_025076) is another VGAM1957 host target gene. UXS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by UXS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of UXS1 BINDING SITE, designated SEQ ID:24676, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66331] Another function of VGAM1957 is therefore inhibition of UDP-glucuronate Decarboxylase 1 (UXS1, Accession NM\_025076). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UXS1. Xylosyltransferase I (XYLT1, Accession XM\_085432) is another VGAM1957 host target gene. XYLT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XYLT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XYLT1 BINDING SITE, designated SEQ ID:38139, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66332] Another function of VGAM1957 is therefore inhibition of Xylosyltransferase I (XYLT1, Accession XM\_085432). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XYLT1. YF13H12 (Accession NM\_014297)

is another VGAM1957 host target gene. YF13H12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by YF13H12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YF13H12 BINDING SITE, designated SEQ ID:15594, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66333] Another function of VGAM1957 is therefore inhibition of YF13H12 (Accession NM\_014297). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YF13H12. LOC120114 (Accession XM\_061871) is another VGAM1957 host target gene. LOC120114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120114 BINDING SITE, designated SEQ ID:37211, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66334] Another function of VGAM1957 is therefore inhibition of LOC120114 (Accession XM\_061871). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120114. LOC130644 (Accession XM\_065813) is another VGAM1957 host target gene. LOC130644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130644 BINDING SITE, designated SEQ ID:37303, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66335] Another function of VGAM1957 is therefore inhibition of LOC130644 (Accession XM\_065813). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130644. LOC142955 (Accession XM\_084389) is another VGAM1957 host target gene. LOC142955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC142955, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142955 BINDING SITE, designated SEQ ID:37571, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66336] Another function of VGAM1957 is therefore inhibition of LOC142955 (Accession XM\_084389). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142955. LOC143916 (Accession XM\_084664) is another VGAM1957 host target gene. LOC143916 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143916 BINDING SITE, designated SEQ ID:37652, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66337] Another function of VGAM1957 is therefore inhibition of LOC143916 (Accession XM\_084664). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143916. LOC145371 (Accession XM\_085123) is another VGAM1957 host target gene. LOC145371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE, designated SEQ ID:37849, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66338] Another function of VGAM1957 is therefore inhibition of LOC145371 (Accession XM\_085123). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. LOC148764 (Accession XM\_086307) is another VGAM1957 host target gene. LOC148764 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148764 BINDING SITE, designated SEQ ID:38590, to the nucleotide sequence of VGAM1957 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4668.

[66339] Another function of VGAM1957 is therefore inhibition of LOC148764 (Accession XM\_086307). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148764. LOC150577 (Accession XM\_097918) is another VGAM1957 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41222, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66340] Another function of VGAM1957 is therefore inhibition of LOC150577 (Accession XM\_097918). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC150967 (Accession XM\_087060) is another VGAM1957 host target gene. LOC150967 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150967, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150967 BINDING SITE, designated SEQ ID:39034, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66341] Another function of VGAM1957 is therefore inhibition of LOC150967 (Accession XM\_087060). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150967. LOC151475 (Accession XM\_098063) is another VGAM1957 host target gene. LOC151475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:41358, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66342] Another function of VGAM1957 is therefore inhibition of LOC151475 (Accession XM\_098063). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151475. LOC157869 (Accession XM\_088409) is another VGAM1957 host target gene. LOC157869 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157869, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157869 BINDING SITE, designated SEQ ID:39677, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66343] Another function of VGAM1957 is therefore inhibition of LOC157869 (Accession XM\_088409). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157869. LOC202025 (Accession XM\_117353) is another VGAM1957 host target gene. LOC202025 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202025 BINDING SITE, designated SEQ ID:43404, to

the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66344] Another function of VGAM1957 is therefore inhibition of LOC202025 (Accession XM\_117353). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202025. LOC255327 (Accession XM\_171236) is another VGAM1957 host target gene. LOC255327 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255327 BINDING SITE, designated SEQ ID:46022, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66345] Another function of VGAM1957 is therefore inhibition of LOC255327 (Accession XM\_171236). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255327. LOC51336 (Accession NM\_016646) is another VGAM1957 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC51336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:18754, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66346] Another function of VGAM1957 is therefore inhibition of LOC51336 (Accession NM\_016646). Accordingly, utilities of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. LOC55971 (Accession NM\_018842) is another VGAM1957 host target gene. LOC55971 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC55971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55971 BINDING SITE, designated SEQ ID:20827, to the nucleotide sequence of VGAM1957 RNA, herein designated VGAM RNA, also designated SEQ ID:4668.

[66347] Another function of VGAM1957 is therefore inhibition of LOC55971 (Accession NM\_018842). Accordingly, utilities

of VGAM1957 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55971. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1958 (VGAM1958) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[66348] VGAM1958 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1958 was detected is described hereinabove with reference to Figs. 1–8.

[66349] VGAM1958 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1958 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[66350] VGAM1958 gene encodes a VGAM1958 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1958 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1958 precursor RNA is designated SEQ ID:1944, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1944 is located at position 13516 relative to the genome of Macaca Mulatta Rhadinovirus.

[66351] VGAM1958 precursor RNA folds onto itself, forming VGAM1958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[66352] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1958 folded precursor RNA into VGAM1958 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1958 RNA is designated SEQ ID:4669, and

is provided hereinbelow with reference to the sequence listing part.

[66353] VGAM1958 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1958 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[66354] VGAM1958 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1958 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1958 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[66355] The complementary binding of VGAM1958 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1958 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1958 host target RNA into VGAM1958 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[66356] It is appreciated that VGAM1958 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1958 host target genes. The mRNA of each one of this plurality of VGAM1958 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1958 RNA, herein designated VGAM RNA, and which when bound by VGAM1958 RNA causes inhibition of translation of respective one or more VGAM1958 host target proteins.

[66357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1958 gene, herein designated VGAM GENE, on one or more VGAM1958 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[66358] It is yet further appreciated that a function of VGAM1958 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1958 correlate with, and may be deduced from, the identity of the host target genes which VGAM1958 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[66359] Nucleotide sequences of the VGAM1958 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1958 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1958 are further described hereinbelow with reference to Table 1.

[66360] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1958 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1958 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[66361] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1958 gene, herein designated VGAM is inhibition of expression of VGAM1958 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1958 correlate with, and may be deduced from, the identity of the target genes which VGAM1958 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[66362] Amiloride Binding Protein 1 (amine oxidase (copper-containing)) (ABP1, Accession XM\_032220) is a VGAM1958 host target gene. ABP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABP1 BINDING SITE, designated SEQ ID:31613, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66363] A function of VGAM1958 is therefore inhibition of Amiloride Binding Protein 1 (amine oxidase (copper-containing)) (ABP1, Accession XM\_032220), a gene which catalyzes the degradation of compounds such as putrescine. Accordingly, utilities of VGAM1958 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ABP1. The function of ABP1 has been established by previous studies. Amiloride acts as a diuretic via the closure of epithelial sodium ion channels. Phenamil, an analog of the diuretic amiloride, is a potent blocker of the epithelial sodium channel. Barbry et al. (1990) used phenamil to purify the porcine kidney amiloride-binding protein. They then used synthetic oligonucleotides derived from partial sequences to screen a human kidney cDNA library and to isolate the cDNA encoding the human amiloride-binding protein. Using this cDNA, Barbry et al. (1990) mapped the corresponding structural gene to 7q34-q36 by in situ hybridization. From studies of association between the ABP gene and cystic fibrosis (OMIM Ref. No. 219700) by means of RFLPs, Barbry et al. (1990) excluded the gene from involvement in that disorder. Barbry et al. (1990) pointed out that amiloride-sensitive  $\text{Na}^+$  channels are also present in airway epithelia, where they play an important role in fluid secretion. Amiloride inhibits the excessive absorption of  $\text{Na}^+$  and liquid that takes place in airway epithelia of patients with cystic fibrosis, and amiloride aerosol therapy has been tried for the treatment of lung disease in CF.

[66364] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66365] Barbry, P.; Champe, M.; Chassande, O.; Munemitsu, S.; Champigny, G.; Lingueglia, E.; Maes, P.; Frelin, C.; Tartar, A.; Ullrich, A.; Lazdunski, M. : Human kidney amiloride-binding protein: cDNA structure and functional expression. *Proc. Nat. Acad. Sci.* 87: 7347–7351, 1990. ; and

[66366] Novotny, W. F.; Chassande, O.; Baker, M.; Lazdunski, M.; Barbry, P. : Diamine oxidase is the amiloride-binding protein and is inhibited by amiloride analogues. *J. Biol. Chem.* 269: 9921–9.

[66367] Further studies establishing the function and utilities of ABP1 are found in John Hopkins OMIM database record ID 104610, and in cited publications numbered 202–205 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ACK1 (Accession NM\_005781) is another VGAM1958 host target gene. ACK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se–

quences of ACK1 BINDING SITE, designated SEQ ID:12358, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66368] Another function of VGAM1958 is therefore inhibition of ACK1 (Accession NM\_005781). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACK1. Adenosine Deaminase, RNA-specific (ADAR, Accession NM\_001111) is another VGAM1958 host target gene. ADAR BINDING SITE1 through ADAR BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE1 through ADAR BINDING SITE3, designated SEQ ID:6773, SEQ ID:17959 and SEQ ID:17966 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66369] Another function of VGAM1958 is therefore inhibition of Adenosine Deaminase, RNA-specific (ADAR, Accession NM\_001111), a gene which converts adenosine to inosine in double-stranded RNA. Accordingly, utilities of

VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR. The function of ADAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323. Adenylate Cyclase 6 (ADCY6, Accession NM\_015270) is another VGAM1958 host target gene. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADCY6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:17588 and SEQ ID:6331 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66370] Another function of VGAM1958 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM\_015270), a gene which is a membrane-bound,  $Ca^{2+}$ -inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6.

The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM22. Annexin A5 (ANXA5, Accession NM\_001154) is another VGAM1958 host target gene. ANXA5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ANXA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANXA5 BINDING SITE, designated SEQ ID:6823, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66371] Another function of VGAM1958 is therefore inhibition of Annexin A5 (ANXA5, Accession NM\_001154), a gene which acts as an indirect inhibitor of the thromboplastin-specific complex. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANXA5. The function of ANXA5 has been established by previous studies. PP4 is an anticoagulant protein that acts as an indirect inhibitor of the thromboplastin-specific complex, which is involved in the blood coagulation cascade. It has a relative molecu-

lar weight of about 35,000 and is present in placental tissue to the extent of about 50 mg per placenta with very little secretion into the maternal bloodstream. The PP4 cDNA encoded a protein of 320 amino acid residues. In addition to the PP4 cDNA, Grundmann et al. (1988) identified cDNA encoding a protein with 74% identity to PP4, which they termed PP4-X. PP4 and PP4-X belong to the lipocortin family, as judged by their homology to lipocortin I (OMIM Ref. No. 151690) and calpactin I (OMIM Ref. No. 151720). The placental anticoagulant protein called PAP, isolated by Funakoshi et al. (1987), may be the same protein. PP4 is also known as endonexin II. Endonexin II is a member of the family of  $\text{Ca}^{2+}$ -dependent phospholipid binding proteins, known as annexins, which bind to the phospholipids that are preferentially located on the cytosolic face of the plasma membrane. Kaplan et al. (1988) cloned endonexin II cDNA and expressed it in *Escherichia coli*. A single mRNA, approximately 1.6 kb long, was found to be expressed in human cell lines and placenta. The length of the cDNA clone was 1.59 kb. The cDNA predicted a 320-amino acid protein with a sequence in agreement with the previously determined partial amino acid sequence of endonexin II isolated from placenta.

[66372] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66373] Grundmann, U.; Abel, K.-J.; Bohn, H.; Lobermann, H.; Lottspeich, F.; Kupper, H. : Characterization of cDNA encoding human placental anticoagulant protein (PP4): homology with the lipocortin family. Proc. Nat. Acad. Sci. 85: 3708–3712, 1988. ; and

[66374] Kaplan, R.; Jaye, M.; Burgess, W. H.; Schlaepfer, D. D.; Haigler, H. T. : Cloning and expression of cDNA for human endonexin II, a Ca(2+) and phospholipid binding protein. J. Biol. Chem.

[66375] Further studies establishing the function and utilities of ANXA5 are found in John Hopkins OMIM database record ID 131230, and in cited publications numbered 12203–12210 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Amine Oxidase, Copper Containing 3 (vascular adhesion protein 1) (AOC3, Accession NM\_003734) is another VGAM1958 host target gene. AOC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AOC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AOC3 BINDING SITE, designated SEQ ID:9824, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66376] Another function of VGAM1958 is therefore inhibition of Amine Oxidase, Copper Containing 3 (vascular adhesion protein 1) (AOC3, Accession NM\_003734), a gene which catalyze the oxidative conversion of amines to aldehydes in the presence of copper and quinone cofactor. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOC3. The function of AOC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175. Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM\_001282) is another VGAM1958 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BIND-

ING SITE, designated SEQ ID:6948, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66377] Another function of VGAM1958 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM\_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126. Ras Homolog Gene Family, Member A (ARHA, Accession XM\_047561) is another VGAM1958 host target gene. ARHA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHA BINDING SITE, designated SEQ ID:35002, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66378] Another function of VGAM1958 is therefore inhibition of Ras Homolog Gene Family, Member A (ARHA, Accession XM\_047561), a gene which regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHA. The function of ARHA has been established by previous studies. The small guanine triphosphatase (GTP) Rho regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. In their Figure 3C, Maekawa et al. (1999) diagrammed proposed signaling pathways for Rho-induced remodeling of the actin cytoskeleton. They demonstrated that active Rho signals to its downstream effector ROCK1 (OMIM Ref. No. 601702), which phosphorylates and activates LIM kinase (see OMIM Ref. No. 601329). LIM kinase, in turn, phosphorylates cofilin (OMIM Ref. No. 601442), inhibiting its actin-depolymerizing activity. Rao et al. (2001) investigated the role of Rho kinase in the modulation of aqueous humor outflow facility. The treatment of human trabecular meshwork and canal of Schlemm cells with a Rho kinase-specific inhibitor led to significant but reversible changes in cell shape and decreased actin stress fibers, focal ad-

hesions, and protein phosphotyrosine staining. Based on the Rho kinase inhibitor–induced changes in myosin light chain phosphorylation and actomyosin organization, the authors suggested that cellular relaxation and loss of cell–substratum adhesions in the human trabecular meshwork and canal of Schlemm cells could result in either increased paracellular fluid flow across the canal of Schlemm or altered flow pathway through the juxtacanalicular tissue, thereby lowering resistance to outflow. They suggested Rho kinase as a potential target for the development of drugs to modulate intraocular pressure in glaucoma patients.

[66379] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66380] Maekawa, M.; Ishizaki, T.; Boku, S.; Watanabe, N.; Fujita, A.; Iwamatsu, A.; Obinata, T.; Ohashi, K.; Mizuno, K.; Narumiya, S. : Signaling from Rho to the actin cytoskeleton through protein kinases ROCK and LIM–kinase. *Science* 285: 895–898, 1999. ; and

[66381] Rao, P. V.; Deng, P.–F.; Kumar, J.; Epstein, D. L. : Modulation of aqueous humor outflow facility by the Rho kinase–specific inhibitor Y–27632. *Invest. Ophthalm. Vis. Sci.* 42:

1029–1037.

[66382] Further studies establishing the function and utilities of ARHA are found in John Hopkins OMIM database record ID 165390, and in cited publications numbered 10904, 1090 and 10911–10913 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM\_003899) is another VGAM1958 host target gene. ARHGEF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF7 BINDING SITE, designated SEQ ID:9981, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66383] Another function of VGAM1958 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM\_003899), a gene which acts as a rac1 guanine nucleotide exchange factor (gef) and can induce membrane ruffling. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ARHGEF7. The function of ARHGEF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM297. Arylsulfatase B (ARSB, Accession NM\_000046) is another VGAM1958 host target gene. ARSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARSB BINDING SITE, designated SEQ ID:5488, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66384] Another function of VGAM1958 is therefore inhibition of Arylsulfatase B (ARSB, Accession NM\_000046). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARSB. Armadillo Repeat Gene Deletes In Velocardiofacial Syndrome (ARVCF, Accession NM\_001670) is another VGAM1958 host target gene. ARVCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARVCF, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARVCF BINDING SITE, designated SEQ ID:7383, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66385] Another function of VGAM1958 is therefore inhibition of Armadillo Repeat Gene Deletes In Velocardiofacial Syndrome (ARVCF, Accession NM\_001670), a gene which is involved in protein-protein interactions at adherens junctions. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARVCF. The function of ARVCF has been established by previous studies. Velocardiofacial syndrome (VCFS; 192430) and DiGeorge syndrome (DGS; 188400) are autosomal dominant disorders that share a wide spectrum of phenotypes, including cleft palate, conotruncal heart defects, and facial dysmorphology. Both syndromes are thought to result from a developmental field defect. Hemizygosity for a portion of 22q11 has been detected in 80 to 85% of VCFS/DGS patients. To identify genes in 22q11 that may contribute to the phenotype of VCFS, Sirotkin et al. (1997) used cDNA selection and cDNA

library screening to clone the full-length human 'armadillo repeat gene deleted in VCFS' (ARVCF) cDNA. ARVCF encodes a 962-amino acid protein that contains 2 motifs involved in protein-protein interactions: a coiled-coil domain near the N terminus and 10 tandem armadillo repeats in the central region. Comparison of the ARVCF sequence with protein databases showed that the structure of ARVCF is most closely related to the catenin family. Members of this family play important roles in the formation of adherens junction complexes. These data suggest that ARVCF is involved in protein-protein interactions at adherens junctions. Unlike other catenin family members, ARVCF contains a nuclear localization signal (NLS), suggesting that ARVCF functions as a nuclear protein. Northern blotting showed that ARVCF is ubiquitously expressed as a 4.0- to 4.3-kb transcript in fetal and adult tissues, and Southern blotting revealed that ARVCF is conserved in vertebrates and *Drosophila*. Sirotkin et al. (1997) mapped the ARVCF gene to chromosome 22 by fluorescence in situ hybridization and to 22q11 using physical mapping methods. ARVCF is located within the region of 22q11 that is hemizygous in all VCFS/DGS patients who have interstitial deletions. Based on the physical location and potential

functions of ARVCF, Sirotkin et al. (1997) suggested that hemizyosity of ARVCF plays a role in the etiology of some of the phenotypes associated with VCFS.

[66386] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66387] Bonne, S.; van Hengel, J.; van Roy, F. : Chromosomal mapping of human armadillo genes belonging to the p120(ctn)/plakophilin subfamily. *Genomics* 51: 452–454, 1998. ; and

[66388] Sirotkin, H.; O'Donnell, H.; DasGupta, R.; Halford, S.; St. Jore, B.; Puech, A.; Parimoo, S.; Morrow, B.; Skoultchi, A.; Weissman, S. M.; Scambler, P.; Kucherlapati, R. : Identification.

[66389] Further studies establishing the function and utilities of ARVCF are found in John Hopkins OMIM database record ID 602269, and in cited publications numbered 702 and 8675 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Class VI, Type 11A (ATP11A, Accession XM\_085028) is another VGAM1958 host target gene. ATP11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP11A, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11A BINDING SITE, designated SEQ ID:37807, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66390] Another function of VGAM1958 is therefore inhibition of ATPase, Class VI, Type 11A (ATP11A, Accession XM\_085028). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11A. ATPase, Cu<sup>++</sup> Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053) is another VGAM1958 host target gene. ATP7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7B BINDING SITE, designated SEQ ID:5506, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66391] Another function of VGAM1958 is therefore inhibition of

ATPase, Cu++ Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7B. ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM\_036933) is another VGAM1958 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32516, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66392] Another function of VGAM1958 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM\_036933). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_000489) is another VGAM1958 host target gene. ATRX BINDING SITE1

and ATRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATRX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRX BINDING SITE1 and ATRX BINDING SITE2, designated SEQ ID:6093 and SEQ ID:28681 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66393] Another function of VGAM1958 is therefore inhibition of Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_000489). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRX. Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_054025) is another VGAM1958 host target gene. B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2, designated SEQ ID:27628 and SEQ ID:20716 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66394] Another function of VGAM1958 is therefore inhibition of Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_054025). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GAT1. UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 2 (B4GALT2, Accession NM\_003780) is another VGAM1958 host target gene. B4GALT2 BINDING SITE1 and B4GALT2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B4GALT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT2 BINDING SITE1 and B4GALT2 BINDING SITE2, designated SEQ ID:9865 and SEQ ID:6860 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66395] Another function of VGAM1958 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 2 (B4GALT2, Accession NM\_003780). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT2. Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM\_003458) is another VGAM1958 host target gene. BSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE, designated SEQ ID:9520, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66396] Another function of VGAM1958 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM\_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSN. The function of BSN and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM638. Calcium Channel, Voltage-dependent, Alpha 2/delta Subunit 2 (CACNA2D2, Accession NM\_006030) is another VGAM1958 host target gene. CACNA2D2 BINDING SITE1 and CACNA2D2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CACNA2D2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA2D2 BINDING SITE1 and CACNA2D2 BINDING SITE2, designated SEQ ID:12651 and SEQ ID:12648 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66397] Another function of VGAM1958 is therefore inhibition of Calcium Channel, Voltage-dependent, Alpha 2/delta Subunit 2 (CACNA2D2, Accession NM\_006030), a gene which is a calcium channel protein which plays an important role in excitation-contraction coupling. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA2D2. The function of CACNA2D2 and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM203. CARPX (Accession NM\_020178) is another VGAM1958 host target gene. CARPX BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CARPX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARPX BINDING SITE, designated SEQ ID:21395, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66398] Another function of VGAM1958 is therefore inhibition of CARPX (Accession NM\_020178), a gene which is alpha-carbonic anhydrases-related protein. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARPX. The function of CARPX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM904. Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM\_001228) is another

VGAM1958 host target gene. CASP8 BINDING SITE1 and CASP8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE1 and CASP8 BINDING SITE2, designated SEQ ID:6897 and SEQ ID:27210 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66399] Another function of VGAM1958 is therefore inhibition of Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM\_001228), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor-induced apoptosis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP8. The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM145.CD80 Antigen (CD28 antigen ligand 1, B7-1 antigen) (CD80, Ac-

cession NM\_005191) is another VGAM1958 host target gene. CD80 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CD80, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD80 BINDING SITE, designated SEQ ID:11695, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66400] Another function of VGAM1958 is therefore inhibition of CD80 Antigen (CD28 antigen ligand 1, B7-1 antigen) (CD80, Accession NM\_005191), a gene which provides regulatory signals for T lymphocytes. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD80. The function of CD80 has been established by previous studies. The B-lymphocyte activation antigen B7-1 (formerly referred to as B7) provides regulatory signals for T lymphocytes as a consequence of binding to the CD28 (OMIM Ref. No. 186760) and CTLA-4 (OMIM Ref. No. 123890) ligands of T cells. The cDNA for B7-1 predicts a type I membrane protein, i.e., one synthesized with a signal peptide that is cleaved upon translocation across the

endoplasmic membrane. The protein is predicted to contain 2 extracellular domains structurally similar to those of Ig, a hydrophobic transmembrane region, and a short cytoplasmic domain. Selvakumar et al. (1992) found that the gene has 6 exons that span approximately 32 kb of genomic DNA. Exon 1 is not translated, and exon 2 contains the initiation ATG codon and encodes a predicted signal peptide. Exons 3 and 4 correspond to 2 Ig-like domains, whereas exons 5 and 6, respectively, encode the transmembrane portion and the cytoplasmic tail. This close relationship between exons and functional domains is a characteristic feature of genes of the Ig superfamily. As the ligand for CD28, LAB7-1 is also symbolized CD28LG1. Reeves et al. (1997) demonstrated that the CD80 and CD86 (OMIM Ref. No. 601020) genes are linked on human chromosome 3 and mouse chromosome 16. These 2 genes encode B7-1 and B7-2, respectively, which are structurally similar members of the immunoglobulin superfamily expressed on a variety of hematopoietic cell types. Reeves et al. (1997) stated that they provide a costimulatory signal to T cells by interacting with CD28 and CTLA4

[66401] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [66402] Selvakumar, A.; Mohanraj, B. K.; Eddy, R. L.; Shows, T. B.; White, P. C.; Dupont, B. : Genomic organization and chromosomal location of the human gene encoding the B-lymphocyte activation antigen B7. Immunogenetics 36: 175-181, 1992. ; and
- [66403] Reeves, R. H.; Patch, D.; Sharpe, A. H.; Borriello, F.; Freeman, G. J.; Edelhoff, S.; Disteché, C. : The costimulatory genes Cd80 and Cd86 are linked on mouse chromosome 16 and human chr.
- [66404] Further studies establishing the function and utilities of CD80 are found in John Hopkins OMIM database record ID 112203, and in cited publications numbered 4548, 4549-455 and 4346 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CD83 Antigen (activated B lymphocytes, immunoglobulin superfamily) (CD83, Accession NM\_004233) is another VGAM1958 host target gene. CD83 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD83, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of CD83 BINDING SITE, designated SEQ ID:10426, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66405] Another function of VGAM1958 is therefore inhibition of CD83 Antigen (activated B lymphocytes, immunoglobulin superfamily) (CD83, Accession NM\_004233), a gene which may play a significant role in antigen presentation or the cellular interactions that follow lymphocyte activation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD83. The function of CD83 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929. Cadherin Related 23 (CDH23, Accession NM\_022124) is another VGAM1958 host target gene. CDH23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH23 BINDING SITE, designated SEQ ID:22669, to the nucleotide sequence of

VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66406] Another function of VGAM1958 is therefore inhibition of Cadherin Related 23 (CDH23, Accession NM\_022124). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH23. Cyclin-dependent Kinase Inhibitor 1A (p21, Cip1) (CDKN1A, Accession NM\_078467) is another VGAM1958 host target gene. CDKN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1A BINDING SITE, designated SEQ ID:27781, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66407] Another function of VGAM1958 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 1A (p21, Cip1) (CDKN1A, Accession NM\_078467), a gene which inhibits cyclin-kinase activity and probably serves as the effector of p53 cell cycle control. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CDKN1A. The function of CDKN1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1912. Centromere Protein B, 80kDa (CENPB, Accession XM\_045451) is another VGAM1958 host target gene. CENPB BINDING SITE1 and CENPB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CENPB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENPB BINDING SITE1 and CENPB BINDING SITE2, designated SEQ ID:34463 and SEQ ID:34466 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66408] Another function of VGAM1958 is therefore inhibition of Centromere Protein B, 80kDa (CENPB, Accession XM\_045451), a gene which is the major centromere antigen . Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENPB. The function of CENPB and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM206. Centrosomal Protein 2 (CEP2, Accession NM\_007186) is another VGAM1958 host target gene. CEP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP2 BINDING SITE, designated SEQ ID:14042, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66409] Another function of VGAM1958 is therefore inhibition of Centrosomal Protein 2 (CEP2, Accession NM\_007186), a gene which interacts with TC10 and CDC42. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP2. The function of CEP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. Cholinergic Receptor, Nicotinic, Beta Polypeptide 1 (muscle) (CHRNA1, Accession XM\_018451) is another VGAM1958 host target gene.

CHRNA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNA1 BINDING SITE, designated SEQ ID:30360, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66410] Another function of VGAM1958 is therefore inhibition of Cholinergic Receptor, Nicotinic, Beta Polypeptide 1 (muscle) (CHRNA1, Accession XM\_018451). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNA1. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 5 (CHST5, Accession NM\_012126) is another VGAM1958 host target gene. CHST5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST5 BINDING SITE, designated SEQ ID:14439, to the nucleotide se-

quence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66411] Another function of VGAM1958 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 5 (CHST5, Accession NM\_012126), a gene which may be involved in sulfation of glycoproteins and proteoglycans. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST5. The function of CHST5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM186. Chloride Channel 7 (CLCN7, Accession NM\_001287) is another VGAM1958 host target gene. CLCN7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCN7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN7 BINDING SITE, designated SEQ ID:6964, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66412] Another function of VGAM1958 is therefore inhibition of

Chloride Channel 7 (CLCN7, Accession NM\_001287), a gene which is voltage-gated chloride channel. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN7. The function of CLCN7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM623.C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252) is another VGAM1958 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLECSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:14919, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66413] Another function of VGAM1958 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252). Accordingly, utilities of VGAM1958 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5. Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM\_033096) is another VGAM1958 host target gene. CLTCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLTCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLTCL1 BINDING SITE, designated SEQ ID:31838, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66414] Another function of VGAM1958 is therefore inhibition of Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM\_033096), a gene which is involved in vesicle budding. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLTCL1. The function of CLTCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42. Collagen, Type XI, Alpha 2 (COL11A2, Accession NM\_080681) is another VGAM1958 host target gene. COL11A2 BINDING

SITE1 and COL11A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL11A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL11A2 BINDING SITE1 and COL11A2 BINDING SITE2, designated SEQ ID:27979 and SEQ ID:27974 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66415] Another function of VGAM1958 is therefore inhibition of Collagen, Type XI, Alpha 2 (COL11A2, Accession NM\_080681). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL11A2. Collagen-like Tail Subunit (single strand of homotrimer) of Asymmetric Acetylcholinesterase (COLQ, Accession NM\_080539) is another VGAM1958 host target gene. COLQ BINDING SITE1 through COLQ BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COLQ, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of COLQ BINDING SITE1 through COLQ BINDING SITE6, designated SEQ ID:27855, SEQ ID:27858, SEQ ID:27864, SEQ ID:27852, SEQ ID:27861 and SEQ ID:12232 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66416] Another function of VGAM1958 is therefore inhibition of Collagen-like Tail Subunit (single strand of homotrimer) of Asymmetric Acetylcholinesterase (COLQ, Accession NM\_080539). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLQ. Copine VII (CPNE7, Accession NM\_014427) is another VGAM1958 host target gene. CPNE7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPNE7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPNE7 BINDING SITE, designated SEQ ID:15787, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66417] Another function of VGAM1958 is therefore inhibition of

Copine VII (CPNE7, Accession NM\_014427). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE7. Cofactor Required For Sp1 Transcriptional Activation, Subunit 6, 77kDa (CRSP6, Accession NM\_004268) is another VGAM1958 host target gene. CRSP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CRSP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRSP6 BINDING SITE, designated SEQ ID:10471, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66418] Another function of VGAM1958 is therefore inhibition of Cofactor Required For Sp1 Transcriptional Activation, Subunit 6, 77kDa (CRSP6, Accession NM\_004268), a gene which is required for Sp1 mediated transcriptional activation with TAF(II)s. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRSP6. The function of CRSP6 has been established by previous studies. Using a

HeLa cell line, Ito et al. (1999) cloned TRAP80, the gene encoding the 80-kD subunit of the TRAP complex. (For background information on thyroid hormone receptor-associated proteins (TRAPs), see 300182). The TRAP80 cDNA encodes a 717-amino acid protein that has no obvious motifs other than a short leucine zipper in the middle of the sequence. The TRAP80 cDNA appears to be equivalent to the p78 component of the mouse Mediator (Jiang et al., 1998). Northern blot analysis of multiple human tissues showed that the TRAP80 gene is ubiquitously expressed as an approximately 3.0-kb transcript. Gene transcription requires factors that recognize transcriptional enhancer sites in DNA. These factors work with coactivators to direct transcriptional initiation by the RNA polymerase II apparatus (see OMIM Ref. No. POLR2A, 180660). Transcriptional activation by enhancer-binding factors such as SP1 (OMIM Ref. No. 189906) requires interaction with the TFIID complex (see OMIM Ref. No. TAF2A, 313650). To identify other potential SP1 cofactors, Ryu et al. (1999) developed an in vitro transcription assay consisting of TFIIA (GTF2A1; 600520), RNA polII, and the basal transcription factors GTF2B (OMIM Ref. No. 189963), GTF2E (OMIM Ref. No. 189962), GTF2F (OMIM Ref. No.

189968), and GTF2H (OMIM Ref. No. 189972), supplemented with TFIID or TBP (OMIM Ref. No. 600075). By sequential chromatography, they excluded PC4 (OMIM Ref. No. 600503) as an SP1 cofactor and identified a multisubunit cofactor, CRSP (cofactor required for SP1 activation), which, along with TFIID, is required for efficient activation by SP1. CRSP behaves as a single complex of approximately 700 kD. Ryu et al. (1999) tentatively identified 9 polypeptides as CRSP subunits (see OMIM Ref. No. also PPARBP, 604311). Using microsequence peptide analysis, they cloned a CRSP cDNA encoding a 77-kD protein, CRSP6, which they termed CRSP77

[66419] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66420] Ito, M.; Yuan, C.-X.; Malik, S.; Gu, W.; Fondell, J. D.; Yamamura, S.; Fu, Z.-Y.; Zhang, X.; Qin, J.; Roeder, R. G. : Identity between TRAP and SMCC complexes indicates novel pathways for the function of nuclear receptors and diverse mammalian activators. *Molec. Cell* 3: 361-370, 1999. ; and

[66421] Ryu, S.; Zhou, S.; Ladurner, A. G.; Tjian, R. : The transcriptional cofactor complex CRSP is required for activity of the

enhancer-binding protein Sp1. Nature 397: 446–450, 1999.

[66422] Further studies establishing the function and utilities of CRSP6 are found in John Hopkins OMIM database record ID 603810, and in cited publications numbered 11384 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cysteine and Glycine-rich Protein 1 (CSRP1, Accession NM\_004078) is another VGAM1958 host target gene. CSRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSRP1 BINDING SITE, designated SEQ ID:10277, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66423] Another function of VGAM1958 is therefore inhibition of Cysteine and Glycine-rich Protein 1 (CSRP1, Accession NM\_004078), a gene which could play a role in neuronal development. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP1. The function of

CSRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM743. Cathepsin D (lysosomal aspartyl protease) (CTSD, Accession NM\_001909) is another VGAM1958 host target gene. CTSD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTSD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTSD BINDING SITE, designated SEQ ID:7627, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66424] Another function of VGAM1958 is therefore inhibition of Cathepsin D (lysosomal aspartyl protease) (CTSD, Accession NM\_001909). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSD. Cullin 4B (CUL4B, Accession NM\_003588) is another VGAM1958 host target gene. CUL4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUL4B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL4B BINDING SITE, designated SEQ ID:9639, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66425] Another function of VGAM1958 is therefore inhibition of Cullin 4B (CUL4B, Accession NM\_003588), a gene which is a negative regulator of the cell cycle in *C. elegans*. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL4B. The function of CUL4B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140. Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM\_022059) is another VGAM1958 host target gene. CXCL16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXCL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCL16 BINDING SITE, designated SEQ ID:22600, to the nucleotide

sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66426] Another function of VGAM1958 is therefore inhibition of Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM\_022059), a gene which induces calcium mobilization. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL16. The function of CXCL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1845. Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 1 (CYP1A1, Accession NM\_000499) is another VGAM1958 host target gene. CYP1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1A1 BINDING SITE, designated SEQ ID:6112, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66427] Another function of VGAM1958 is therefore inhibition of Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 1 (CYP1A1, Accession NM\_000499), a gene which intervenes in an NADPH-dependent electron transport pathway. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1A1. The function of CYP1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM335. Cytochrome P450, Subfamily I (dioxin-inducible), Polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NM\_000104) is another VGAM1958 host target gene. CYP1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1B1 BINDING SITE, designated SEQ ID:5564, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66428] Another function of VGAM1958 is therefore inhibition of

Cytochrome P450, Subfamily I (dioxin-inducible), Polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NM\_000104), a gene which participates in the metabolism of a molecule that is a participant in eye development. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1B1. The function of CYP1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894.

Cytochrome P450, Subfamily XXVIIIB (25-hydroxyvitamin D-1-alpha-hydroxylase), Polypeptide 1 (CYP27B1, Accession NM\_000785) is another VGAM1958 host target gene. CYP27B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP27B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP27B1 BINDING SITE, designated SEQ ID:6432, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66429] Another function of VGAM1958 is therefore inhibition of

Cytochrome P450, Subfamily XXVIIB (25-hydroxyvitamin D-1-alpha-hydroxylase), Polypeptide 1 (CYP27B1, Accession NM\_000785). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP27B1. Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM\_004393) is another VGAM1958 host target gene. DAG1 BINDING SITE1 and DAG1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DAG1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE1 and DAG1 BINDING SITE2, designated SEQ ID:10630 and SEQ ID:10634 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66430] Another function of VGAM1958 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM\_004393), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with DAG1. The function of DAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1095.DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 11 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX11, Accession NM\_004399) is another VGAM1958 host target gene. DDX11 BINDING SITE1 and DDX11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DDX11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE1 and DDX11 BINDING SITE2, designated SEQ ID:10653 and SEQ ID:24986 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66431] Another function of VGAM1958 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 11 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX11, Accession NM\_004399), a gene which could be an ATP-dependent DNA-binding helicase and may intervene in cell cycle regulation. Accordingly, utilities of VGAM1958

include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX11. The function of DDX11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533. Dihydrofolate Reductase (DHFR, Accession NM\_000791) is another VGAM1958 host target gene. DHFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DHFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:6450, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66432] Another function of VGAM1958 is therefore inhibition of Dihydrofolate Reductase (DHFR, Accession NM\_000791), a gene which converts dihydrofolate into tetrahydrofolate. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHFR. The function of DHFR and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM826. Dystrophia Myotonica-protein Kinase (DMPK, Accession NM\_004409) is another VGAM1958 host target gene. DMPK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMPK BINDING SITE, designated SEQ ID:10666, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66433] Another function of VGAM1958 is therefore inhibition of Dystrophia Myotonica-protein Kinase (DMPK, Accession NM\_004409). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMPK. DnaJ (Hsp40) Homolog, Subfamily B, Member 1 (DNAJB1, Accession NM\_006145) is another VGAM1958 host target gene. DNAJB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of DNAJB1 BINDING SITE, designated SEQ ID:12787, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66434] Another function of VGAM1958 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily B, Member 1 (DNAJB1, Accession NM\_006145), a gene which may prevent aggregation of newly translated proteins. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB1. The function of DNAJB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1778. Diphtheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 1 (*S. cerevisiae*) (DPH2L1, Accession NM\_001383) is another VGAM1958 host target gene. DPH2L1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DPH2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPH2L1 BINDING SITE, designated SEQ ID:7054, to the nucleotide

sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66435] Another function of VGAM1958 is therefore inhibition of Diphtheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 1 (*S. cerevisiae*) (DPH2L1, Accession NM\_001383), a gene which may be involved in regulating global protein synthesis; has similarity to *S. cerevisiae* Dph2p. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPH2L1. The function of DPH2L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM608. Dystrobrevin, Alpha (DTNA, Accession NM\_001391) is another VGAM1958 host target gene. DTNA BINDING SITE1 through DTNA BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DTNA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTNA BINDING SITE1 through DTNA BINDING SITE4, designated SEQ ID:7082, SEQ ID:26844, SEQ ID:26839 and SEQ ID:26849 respec-

tively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66436] Another function of VGAM1958 is therefore inhibition of Dystrobrevin, Alpha (DTNA, Accession NM\_001391), a gene which may be involved in the formation and stability of synapses. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTNA. The function of DTNA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1021. Ectodermal Dysplasia 1, Anhidrotic (ED1, Accession NM\_001399) is another VGAM1958 host target gene. ED1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ED1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ED1 BINDING SITE, designated SEQ ID:7098, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66437] Another function of VGAM1958 is therefore inhibition of

Ectodermal Dysplasia 1, Anhidrotic (ED1, Accession NM\_001399). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ED1. Ephrin-A3 (EFNA3, Accession NM\_004952) is another VGAM1958 host target gene. EFNA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNA3 BINDING SITE, designated SEQ ID:11394, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66438] Another function of VGAM1958 is therefore inhibition of Ephrin-A3 (EFNA3, Accession NM\_004952), a gene which is a ligand of Eph-related receptor tyrosine kinases. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNA3. The function of EFNA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.EGF-like-domain,

Multiple 6 (EGFL6, Accession NM\_015507) is another VGAM1958 host target gene. EGFL6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL6 BINDING SITE, designated SEQ ID:17765, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66439] Another function of VGAM1958 is therefore inhibition of EGF-like-domain, Multiple 6 (EGFL6, Accession NM\_015507), a gene which is a members of the epidermal growth factor (EGF) repeat superfamily which are often involved in the regulation of cell cycle, proliferation, and developmental processes. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL6. The function of EGFL6 has been established by previous studies. Using a high-throughput screening-by-hybridization approach, Yeung et al. (1999) identified the EGFL6 gene. The predicted 553-amino acid EGFL6 protein has a putative N-terminal signal peptide, which

suggests that it is secreted; an EGF repeat region containing 4 complete EGF-like repeats and 1 partial EGF-like repeat; an integrin association motif (RGD); 2 potential N-glycosylation sites; and a potential tyrosine phosphorylation site. Northern blot analysis of a variety of normal human tissues detected an approximately 2.4-kb EGFL6 transcript only in placenta. Among the cancer tissues tested, EGFL6 expression was found only in meningioma tumors. Screening-by-hybridization analysis of various cDNA libraries indicated EGFL6 expression in lung tumor, fetal lung, fetal skin, fetal umbilical cord, fetal liver/spleen, and placenta, but not in normal adult tissues, including lung. Buchner et al. (2000) determined that the MAEG gene contains 12 exons.

[66440] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66441] Yeung, G.; Mulero, J. J.; Berntsen, R. P.; Loeb, D. B.; Drmanac, R.; Ford, J. E. : Cloning of a novel epidermal growth factor repeat containing gene EGFL6: expressed in tumor and fetal tissues. *Genomics* 62: 304-307, 1999. ; and

[66442] Buchner, G.; Orfanelli, U.; Quaderi, N.; Bassi, M. T.; An-

dolfi, G.; Ballabio, A.; Franco, B. : Identification of a new EGF-repeat-containing gene from human Xp22: a candidate for develo.

[66443] Further studies establishing the function and utilities of EGFL6 are found in John Hopkins OMIM database record ID 300239, and in cited publications numbered 9013–9014 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM\_022051) is another VGAM1958 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22579, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66444] Another function of VGAM1958 is therefore inhibition of Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM\_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216. Egl Nine Homolog 2 (*C. elegans*) (EGLN2, Accession NM\_017555) is another VGAM1958 host target gene. EGLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN2 BINDING SITE, designated SEQ ID:18991, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66445] Another function of VGAM1958 is therefore inhibition of Egl Nine Homolog 2 (*C. elegans*) (EGLN2, Accession NM\_017555), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN2. The function of EGLN2 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM432.Egl Nine Homolog 3 (*C. elegans*) (EGLN3, Accession NM\_022073) is another VGAM1958 host target gene. EGLN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGLN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN3 BINDING SITE, designated SEQ ID:22618, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66446] Another function of VGAM1958 is therefore inhibition of Egl Nine Homolog 3 (*C. elegans*) (EGLN3, Accession NM\_022073), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN3. The function of EGLN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.EH-domain Containing 4 (EHD4, Accession NM\_139265) is another VGAM1958 host target gene.

EHD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EHD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD4 BINDING SITE, designated SEQ ID:29254, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66447] Another function of VGAM1958 is therefore inhibition of EH-domain Containing 4 (EHD4, Accession NM\_139265). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD4. Eukaryotic Translation Initiation Factor 4A, Isoform 2 (EIF4A2, Accession NM\_001967) is another VGAM1958 host target gene. EIF4A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4A2 BINDING SITE, designated SEQ ID:7696, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66448] Another function of VGAM1958 is therefore inhibition of Eukaryotic Translation Initiation Factor 4A, Isoform 2 (EIF4A2, Accession NM\_001967), a gene which is a sub-unit of a high molecular weight protein complex and is required as a single polypeptide chain for mrna binding to ribosome. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4A2. The function of EIF4A2 has been established by previous studies. Eukaryotic initiation factor 4A plays an important role in the binding of mRNA to the 43S preinitiation complex when protein synthesis begins. Two highly homologous forms of functional EIF4A genes, Eif4a1 (OMIM Ref. No. 602641) and Eif4a2, have been isolated in mice (Nielsen and Trachsel, 1988); yeast cells also possess 2 EIF4A genes, TIF1 and TIF2 (OMIM Ref. No. 601993). The murine Eif4a and yeast TIF genes appear to belong to a DEAD-box gene family, whose members exhibit extensive amino acid similarity and contain the asp-glu-ala-asp (DEAD) sequence. DEAD-box genes have been identified in species ranging from E-coli to humans. Their function appears to be related to transcriptional/translational regulation. Sudo et al. (1995) isolated human cDNA highly homologous to murine

Eif4a2, which encodes one of the protein-synthesis initiation factors involved in the binding of mRNA to the ribosome. The human homolog was expressed in all normal tissues examined, but in variable amounts, being highly expressed in skeletal muscle and ovary, and less abundantly in liver, kidney, and pancreas.

[66449] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66450] Nielsen, P. J.; Trachsel, H. : The mouse protein synthesis initiation factor 4A gene family includes two related functional genes which are differentially expressed. EMBO J. 7: 2097-2105, 1988. ; and

[66451] Sudo, K.; Takahashi, E.; Nakamura, Y. : Isolation and mapping of the human EIF4A2 gene homologous to the murine protein synthesis initiation factor 4A-II gene Eif4a2. Cytogenet. Cell Ge.

[66452] Further studies establishing the function and utilities of EIF4A2 are found in John Hopkins OMIM database record ID 601102, and in cited publications numbered 9632-9634 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ELL (Accession NM\_006532) is another VGAM1958 host target

gene. ELL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELL BINDING SITE, designated SEQ ID:13280, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66453] Another function of VGAM1958 is therefore inhibition of ELL (Accession NM\_006532). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL. Ectonucleoside Triphosphate Diphosphohydrolase 6 (putative function) (ENTPD6, Accession NM\_001247) is another VGAM1958 host target gene. ENTPD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENTPD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENTPD6 BINDING SITE, designated SEQ ID:6918, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66454] Another function of VGAM1958 is therefore inhibition of Ectonucleoside Triphosphate Diphosphohydrolase 6 (putative function) (ENTPD6, Accession NM\_001247), a gene which might support glycosylation reactions in the golgi apparatus and, when released from cells, might catalyze the hydrolysis of extracellular nucleotides. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENTPD6. The function of ENTPD6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827.E1A Binding Protein P300 (EP300, Accession NM\_001429) is another VGAM1958 host target gene. EP300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EP300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EP300 BINDING SITE, designated SEQ ID:7149, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66455] Another function of VGAM1958 is therefore inhibition of

E1A Binding Protein P300 (EP300, Accession NM\_001429), a gene which may have a function in cell cycle regulation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EP300. The function of EP300 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Erythrocyte Membrane Protein Band 4.9 (dematin) (EPB49, Accession NM\_001978) is another VGAM1958 host target gene. EPB49 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EPB49, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB49 BINDING SITE, designated SEQ ID:7709, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66456] Another function of VGAM1958 is therefore inhibition of Erythrocyte Membrane Protein Band 4.9 (dematin) (EPB49, Accession NM\_001978), a gene which is an actin-bundling protein. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with EPB49. The function of EPB49 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM760. Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM\_005670) is another VGAM1958 host target gene. EPM2A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EPM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPM2A BINDING SITE, designated SEQ ID:12226, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66457] Another function of VGAM1958 is therefore inhibition of Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM\_005670), a gene which Laforin; protein tyrosine phosphatase that may have role in glycogen metabolism. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPM2A. The function of EPM2A and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM470.V-ets Erythroblastosis Virus E26 Oncogene Homolog 2 (avian) (ETS2, Accession NM\_005239) is another VGAM1958 host target gene. ETS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ETS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETS2 BINDING SITE, designated SEQ ID:11748, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66458] Another function of VGAM1958 is therefore inhibition of V-ets Erythroblastosis Virus E26 Oncogene Homolog 2 (avian) (ETS2, Accession NM\_005239), a gene which Transcription factor. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETS2. The function of ETS2 has been established by previous studies. See 164720. By in situ hybridization, Watson et al. (1985) mapped the ETS2 locus to 21q22.1-q22.3. Sacchi et al. (1986) found that the ETS2 gene was translocated to

chromosome 8 in the translocation t(8;21)(q22;q22), which is commonly found in patients with acute myeloid leukemia with morphology M2 (OMIM Ref. No. AML-M2). In a case of t(8;21)(q22;q22), Le Beau et al. (1986) found that the ETS2 gene was translocated to chromosome 8. The MOS oncogene (OMIM Ref. No. 190060) was retained at the breakpoint on chromosome 8; thus, one or both of these genes may play a role in the pathogenesis of acute myelogenous leukemia. Using genetic linkage analysis, Sacchi et al. (1988) demonstrated the location of the ETS2 gene relative to other loci and established that the breakpoint in acute myeloid leukemia is about 17 cM from ETS2. Thus, the breakpoint does not affect the ETS2 gene structure. The actual DNA sequence involved in the t(8;21) may reside in a 3-cM genetic region between 2 markers used in these studies. By family linkage studies using RFLPs, Sacchi et al. (1988) demonstrated that ERG is situated just proximal to ETS2. Mavrothalassitis et al. (1990) demonstrated that the ETS2 gene has no TATA box or CAAT box in its promoter. It has an alternative structure that serves a comparable function. The p16(INK4A) cyclin-dependent kinase inhibitor (CDKN2A; 600160) is implicated in replicative senescence, the state of permanent

growth arrest provoked by cumulative cell divisions or as a response to constitutive Ras–Raf–MEK signaling in somatic cells. Ohtani et al. (2001) demonstrated a role for the ETS1 and ETS2 transcription factors in regulating the expression of p16(INK4A) in these different contexts based on their ability to activate the p16(INK4A) promoter through an ETS binding site and their patterns of expression during the lifespan of human diploid fibroblasts. The induction of p16(INK4A) by ETS2, which is abundant in young human diploid fibroblasts, is potentiated by signaling through the Ras–Raf–MEK kinase cascade and inhibited by a direct interaction with the helix–loop–helix protein ID1 (OMIM Ref. No. 600349). In senescent cells, where the ETS2 levels and MEK signaling decline, the marked increase in p16(INK4A) expression is consistent with the reciprocal reduction of ID1 and accumulation of ETS1. Animal model experiments lend further support to the function of ETS2. Sumarsono et al. (1996) generated transgenic mice to investigate the consequences of overexpression of Ets2. They found that mice with less than 2-fold Ets2 overexpression in particular organs developed neurocranial, visceral cranial, and cervical skeletal abnormalities. These abnormalities had similarities with the

skeletal anomalies found in trisomy-16 mice and in humans with Down syndrome (OMIM Ref. No. 190685), in which the gene dosage of ETS2 is increased. The results were interpreted as indicating that ETS2 has a role in skeletal development and that overexpression is involved in the genesis of some skeletal abnormalities that occur in Down syndrome.

[66459] It is appreciated that the abovementioned animal model for ETS2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[66460] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66461] Le Beau, M. M.; Rowley, J. D.; Sacchi, N.; Watson, D. K.; Papas, T. S.; Diaz, M. O. : Hu-ets-2 is translocated to chromosome 8 in the t(8;21) in acute myelogenous leukemia. Cancer Genet. Cytogenet. 23: 269-274, 1986. ; and

[66462] Sumarsono, S. H.; Wilson, T. J.; Tymms, M. J.; Venter, D. J.; Corrick, C. M.; Kola, R.; Lahoud, M. H.; Papas, T. S.; Seth, A.; Kola, I. : Down's syndrome-like skeletal abnormalities in E.

[66463] Further studies establishing the function and utilities of

ETS2 are found in John Hopkins OMIM database record ID 164740, and in cited publications numbered 11230–11231, 11042, 1123 and 11233–11045 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Exostoses (multiple)–like 1 (EXTL1, Accession NM\_004455) is another VGAM1958 host target gene. EXTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EXTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL1 BINDING SITE, designated SEQ ID:10756, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66464] Another function of VGAM1958 is therefore inhibition of Exostoses (multiple)–like 1 (EXTL1, Accession NM\_004455), a gene which probably contribute to the synthesis of heparan sulfate and heparin. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL1. The function of EXTL1 and its association with various diseases and clinical conditions, has been estab–

lished by previous studies, as described hereinabove with reference to VGAM806.Exostoses (multiple)-like 2 (EXTL2, Accession NM\_001439) is another VGAM1958 host target gene. EXTL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EXTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL2 BINDING SITE, designated SEQ ID:7162, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66465] Another function of VGAM1958 is therefore inhibition of Exostoses (multiple)-like 2 (EXTL2, Accession NM\_001439), a gene which is homologous to the EXT and EXTL genes. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL2. The function of EXTL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM743.Fanconi Anemia, Complementation Group F (FANCF, Accession NM\_022725) is another VGAM1958

host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:22925, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66466] Another function of VGAM1958 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM\_022725). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. Fibroblast Growth Factor 1 (acidic) (FGF1, Accession NM\_000800) is another VGAM1958 host target gene. FGF1 BINDING SITE1 through FGF1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF1 BINDING SITE1 through FGF1 BINDING SITE3, designated SEQ ID:6470, SEQ ID:26987 and SEQ

ID:26989 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66467] Another function of VGAM1958 is therefore inhibition of Fibroblast Growth Factor 1 (acidic) (FGF1, Accession NM\_000800), a gene which potent mitogen for a variety of cell types. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF1. The function of FGF1 has been established by previous studies. The endothelium, which consists of a single cell layer, protects blood vessels from thrombogenesis. Endothelial cell growth factor is a modifier of endothelial cell migration and proliferation and thus may be important in neovascularization. From a human brain stem cDNA library, Jaye et al. (1986) isolated 2 overlapping clones encoding ECGF. Southern blot analysis suggested that there is a single copy of the ECGF gene. In DNA from human-rodent hybrid cells, the probes showed 100% concordance with chromosome 5 and 98% concordance with HEXB (OMIM Ref. No. 606873), a chromosome 5 marker. The complete amino acid sequence was deduced from the nucleic acid sequence of these clones. The structure of the gene shows similarities to

that of interleukin-1 (OMIM Ref. No. 147720) with which it is about 30% homologous. To elucidate the structural determinants governing specificity in FGF signaling, Plotnikov et al. (2000) determined the crystal structures of FGF1 and FGF2 complexed with the immunoglobulin-like ligand-binding domains 2 and 3 (D2 and D3) of FGFR1 and FGFR2 (OMIM Ref. No. 176943), respectively. They found that highly conserved FGF-D2 and FGF-linker (between D2 and D3) interfaces define a general binding site for all FGF-FGFR complexes. Specificity is achieved through interactions between the N-terminal and central regions of FGFs and 2 loop regions in D3 that are subject to alternative splicing. These structures provide a molecular basis for FGF1 as a universal FGFR ligand and for modulation of FGF-FGFR specificity through primary sequence variations and alternative splicing. Pellegrini et al. (2000) reported the crystal structure of the FGFR2 ectodomain in a dimeric form that is induced by simultaneous binding to FGF1 and a heparin decasaccharide. The complex is assembled around a central heparin molecule linking 2 FGF1 ligands into a dimer that bridges between 2 receptor chains. The asymmetric heparin binding involves contacts with both FGF1 molecules but only 1 receptor chain. The

structure of the FGF1–FGFR2–heparin ternary complex provides a structural basis for the essential role of heparan sulfate in FGF signaling.

[66468] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66469] Plotnikov, A. N.; Hubbard, S. R.; Schlessinger, J.; Mohammadi, M. : Crystal structures of two FGF–FGFR complexes reveal the determinants of ligand–receptor specificity. *Cell* 101: 413–424, 2000. ; and

[66470] Pellegrini, L.; Burke, D. F.; von Delft, F.; Mulloy, B.; Blundell, T. L. : Crystal structure of fibroblast growth factor receptor ectodomain bound to ligand and heparin. *Nature* 407: 102.

[66471] Further studies establishing the function and utilities of FGF1 are found in John Hopkins OMIM database record ID 131220, and in cited publications numbered 11813–11817, 1166 and 11818–11821 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fragile X Mental Retardation 1 (FMR1, Accession NM\_002024) is another VGAM1958 host target gene. FMR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by FMR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMR1 BINDING SITE, designated SEQ ID:7777, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66472] Another function of VGAM1958 is therefore inhibition of Fragile X Mental Retardation 1 (FMR1, Accession NM\_002024). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMR1. FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM\_006732) is another VGAM1958 host target gene. FOSB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOSB BINDING SITE, designated SEQ ID:13581, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66473] Another function of VGAM1958 is therefore inhibition of

FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM\_006732), a gene which interacts with jun proteins enhancing their dna binding activity. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOSB. The function of FOSB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM747. Forkhead Box I1 (FOXI1, Accession NM\_012188) is another VGAM1958 host target gene. FOXI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXI1 BINDING SITE, designated SEQ ID:14474, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66474] Another function of VGAM1958 is therefore inhibition of Forkhead Box I1 (FOXI1, Accession NM\_012188), a gene which plays an important role in the development of the cochlea and vestibulum, as well as embryogenesis. Ac-

cordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXI1. The function of FOXI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1107. Thyroid Autoantigen 70kDa (Ku antigen) (G22P1, Accession NM\_001469) is another VGAM1958 host target gene. G22P1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by G22P1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G22P1 BINDING SITE, designated SEQ ID:7203, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66475] Another function of VGAM1958 is therefore inhibition of Thyroid Autoantigen 70kDa (Ku antigen) (G22P1, Accession NM\_001469), a gene which has a role in chromosome translocation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G22P1. The function of G22P1 and its association with various diseases and clinical

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM1052. Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM\_000151) is another VGAM1958 host target gene. G6PC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by G6PC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5660, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66476] Another function of VGAM1958 is therefore inhibition of Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM\_000151). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 2 (GalNAc-T2) (GALNT2, Accession NM\_004481) is another VGAM1958 host target gene. GALNT2 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by GALNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT2 BINDING SITE, designated SEQ ID:10797, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66477] Another function of VGAM1958 is therefore inhibition of UDP-N-acetyl- $\alpha$ -D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 2 (GalNAc-T2) (GALNT2, Accession NM\_004481), a gene which catalyzes the initial reaction in o-linked oligosaccharide biosynthesis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT2. The function of GALNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM187. Glycoprotein A Repeats Predominant (GARP, Accession NM\_005512) is another VGAM1958 host target gene. GARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GARP, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:12033, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66478] Another function of VGAM1958 is therefore inhibition of Glycoprotein A Repetitions Predominant (GARP, Accession NM\_005512). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP. GCN1 General Control of Amino-acid Synthesis 1-like 1 (yeast) (GCN1L1, Accession XM\_045792) is another VGAM1958 host target gene. GCN1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GCN1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCN1L1 BINDING SITE, designated SEQ ID:34568, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66479] Another function of VGAM1958 is therefore inhibition of

GCN1 General Control of Amino-acid Synthesis 1-like 1 (yeast) (GCN1L1, Accession XM\_045792), a gene which performs an EF3-related function on the ribosome by regulating GCN2 kinase activity. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCN1L1. The function of GCN1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1438. Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM\_002062) is another VGAM1958 host target gene. GLP1R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLP1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP1R BINDING SITE, designated SEQ ID:7828, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66480] Another function of VGAM1958 is therefore inhibition of Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM\_002062), a gene which is mediated by g proteins

which activate adenylyl cyclase. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP1R. The function of GLP1R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1652. Glutaminase (GLS, Accession NM\_014905) is another VGAM1958 host target gene. GLS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17104, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66481] Another function of VGAM1958 is therefore inhibition of Glutaminase (GLS, Accession NM\_014905). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM\_002065) is another VGAM1958 host target gene. GLUL BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by GLUL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUL BINDING SITE, designated SEQ ID:7836, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66482] Another function of VGAM1958 is therefore inhibition of Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM\_002065), a gene which catalyzes the condensation of glutamate and ammonia to form glutamine. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLUL. The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM948. Glypican 1 (GPC1, Accession NM\_002081) is another VGAM1958 host target gene. GPC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of GPC1 BINDING SITE, designated SEQ ID:7868, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66483] Another function of VGAM1958 is therefore inhibition of Glypican 1 (GPC1, Accession NM\_002081), a gene which may play a role in growth control and differentiation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC1. The function of GPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. G Protein-coupled Receptor 61 (GPR61, Accession XM\_086232) is another VGAM1958 host target gene. GPR61 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR61, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR61 BINDING SITE, designated SEQ ID:38563, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4669.

[66484] Another function of VGAM1958 is therefore inhibition of G Protein-coupled Receptor 61 (GPR61, Accession XM\_086232), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR61. The function of GPR61 has been established by previous studies. By PCR of genomic DNA, Lee et al. (2001) obtained a partial GPR61 clone using primers designed from the sequence of a rabbit G protein-coupled receptor (GPCR). They used the PCR products to screen a human brain cDNA library and found that GPR61 encodes a 417-amino acid protein that shares over 80% identity with the rabbit homolog and 44% similarity with GPR62 (OMIM Ref. No. 606917) in the transmembrane region. By Northern blot analysis of human brain areas, Lee et al. (2001) detected a 4.3-kb transcript in caudate, putamen, and thalamus, but not in hypothalamus, hippocampus, pons, frontal cortex, or cerebellum. No expression was found in liver or kidney. Lee et al. (2001) also cloned rat GPR61 and, by in situ hybridization, found widespread expression in rat brain. Cikos et al. (2001) independently

cloned GPR61, which they called BALGR. A partial sequence was obtained by RT-PCR of human brain mRNA using degenerate oligonucleotides corresponding to a transmembrane sequence of GPR30 (OMIM Ref. No. 601805). They cloned the full-length cDNA from a hypothalamus cDNA library. They found that the deduced protein contains 451 amino acids and has a calculated molecular mass of about 49 kD. GPR61 contains 7 putative transmembrane domains, a potential N-glycosylation site, cysteine residues that may form a disulfide bridge, and several putative protein kinase sites. It also contains a conserved glu-arg-tyr sequence shared with other GPCRs. The highest sequence similarity (OMIM Ref. No. 28–31%) was found with biogenic amine GPCRs, i.e., serotonin, histamine, adrenergic, and dopamine GPCRs. By semiquantitative PCR of multiple human tissues, Cikos et al. (2001) found highest expression in brain and testes and low but detectable expression in all other tissues examined. Their results of Northern blot analysis of human brain regions differed from that reported by Lee et al. (2001). Strong expression of a 4.8-kb transcript was found in cerebral cortex, occipital pole, frontal lobe, temporal lobe, amygdala, and hippocampus, and lower expression in putamen

and caudate nucleus. No message was detected in cerebellum, medulla oblongata, spinal cord, corpus callosum, substantia nigra, subthalamic nucleus, or thalamus.

[66485] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66486] Cikos, S.; Gregor, P.; Koppel, J. : Cloning of a novel biogenic amine receptor-like G protein-coupled receptor expressed in human brain. *Biochim. Biophys. Acta* 1521: 66-72, 2001. ; and

[66487] Lee, D. K.; George, S. R.; Cheng, R.; Nguyen, T.; Liu, Y.; Brown, M.; Lynch, K. R.; O'Dowd, B. F. : Identification of four novel human G protein-coupled receptors expressed in the brain.

[66488] Further studies establishing the function and utilities of GPR61 are found in John Hopkins OMIM database record ID 606916, and in cited publications numbered 5504 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Growth Factor Receptor-bound Protein 10 (GRB10, Accession NM\_005311) is another VGAM1958 host target gene. GRB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRB10, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRB10 BINDING SITE, designated SEQ ID:11786, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66489] Another function of VGAM1958 is therefore inhibition of Growth Factor Receptor-bound Protein 10 (GRB10, Accession NM\_005311), a gene which plays a functional role in insulin and IGF-I signaling. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRB10. The function of GRB10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM441. Guanine Nucleotide-releasing Factor 2 (specific for crk proto-oncogene) (GRF2, Accession NM\_005312) is another VGAM1958 host target gene. GRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of GRF2 BINDING SITE, designated SEQ ID:11789, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66490] Another function of VGAM1958 is therefore inhibition of Guanine Nucleotide–releasing Factor 2 (specific for crk proto–oncogene) (GRF2, Accession NM\_005312), a gene which promotes the exchange of ras–bound gdp by gtp. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRF2. The function of GRF2 has been established by previous studies. C3G is a guanine nucleotide–releasing protein (GNRP) identified as a CRK (OMIM Ref. No. 164762) SH3–binding protein. Tanaka et al. (1994) suggested that the complex of C3G and CRK or C3G and GRB2/ASH (OMIM Ref. No. 108355) transduces signals from tyrosine kinases to RAS in a number of different tissues. Using fluorescence in situ hybridization, Takai et al. (1994) mapped the GRF2 gene to 9q34.3, where chromosomal changes have been reported in human hematopoietic malignancies.

[66491] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [66492] Takai, S.; Tanaka, M.; Sugimura, H.; Yamada, K.; Naito, Y.; Kino, I.; Matsuda, M. : Mapping of the human C3G gene coding a guanine nucleotide releasing protein for Ras family to 9q34.3 by fluorescence in situ hybridization. Hum. Genet. 94: 549–550, 1994. ; and
- [66493] Tanaka, S.; Morishita, T.; Hashimoto, Y.; Hattori, S.; Nakamura, S.; Shibuya, M.; Matsuoka, K.; Takenawa, T.; Kurata, T.; Nagashima, K.; Matsuda, M. : C3G, a guanine nucleotide–releasin.
- [66494] Further studies establishing the function and utilities of GRF2 are found in John Hopkins OMIM database record ID 600303, and in cited publications numbered 1594–1595 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM\_000844) is another VGAM1958 host target gene. GRM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM7 BINDING SITE, designated SEQ ID:6514, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA,

also designated SEQ ID:4669.

[66495] Another function of VGAM1958 is therefore inhibition of Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM\_000844), a gene which is mediated by a g-protein that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM7. The function of GRM7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM746. Guanylate Cyclase 1, Soluble, Beta 2 (GUCY1B2, Accession NM\_004129) is another VGAM1958 host target gene. GUCY1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GUCY1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GUCY1B2 BINDING SITE, designated SEQ ID:10334, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66496] Another function of VGAM1958 is therefore inhibition of Guanylate Cyclase 1, Soluble, Beta 2 (GUCY1B2, Accession

NM\_004129), a gene which is beta 2 subunit of soluble guanylate cyclase which converts GTP into the second messenger cGMP and plays a major role in the cardiovascular system as a receptor for nitric oxide. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GUCY1B2. The function of GUCY1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379. Glycogen Synthase 1 (muscle) (GYS1, Accession XM\_114024) is another VGAM1958 host target gene. GYS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GYS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GYS1 BINDING SITE, designated SEQ ID:42624, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66497] Another function of VGAM1958 is therefore inhibition of Glycogen Synthase 1 (muscle) (GYS1, Accession XM\_114024), a gene which transfers the glycosyl residue

from udp-gluc to the nonreducing end of alpha-1,4-glucan. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GYS1. The function of GYS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1323.L-3-hydroxyacyl-Coenzyme A Dehydrogenase, Short Chain (HADHSC, Accession NM\_005327) is another VGAM1958 host target gene. HADHSC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HADHSC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HADHSC BINDING SITE, designated SEQ ID:11798, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66498] Another function of VGAM1958 is therefore inhibition of L-3-hydroxyacyl-Coenzyme A Dehydrogenase, Short Chain (HADHSC, Accession NM\_005327). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with HADHSC. Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM\_003949) is another VGAM1958 host target gene. HAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAP1 BINDING SITE, designated SEQ ID:10075, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66499] Another function of VGAM1958 is therefore inhibition of Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM\_003949), a gene which functions as an adaptor protein using coiled coils to mediate interactions among cytoskeletal, vascular, and motor proteins. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAP1. The function of HAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126. Holocytochrome C Synthase (cytochrome c heme-lyase) (HCCS, Accession

NM\_005333) is another VGAM1958 host target gene.

HCCS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HCCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCCS BINDING SITE, designated SEQ ID:11806, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66500] Another function of VGAM1958 is therefore inhibition of Holocytochrome C Synthase (cytochrome c heme-lyase) (HCCS, Accession NM\_005333), a gene which catalyzes the covalent addition of a heme group onto c-type cytochromes in mitochondria. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCCS. The function of HCCS has been established by previous studies. Microphthalmia with linear skin defects syndrome (MLS; 309801) is an X-linked male-lethal disorder associated with X-chromosomal rearrangements resulting in monosomy from Xpter to Xp22. Features include microphthalmia, sclerocornea, linear skin defects, and agenesis of the corpus callosum. Using a cross-species con-

servation strategy, Schaefer et al. (1996) isolated an expressed sequence from the 450- to 550-kb MLS critical region on Xp22 by screening a human embryo cDNA library. Northern analysis demonstrated a transcript of approximately 2.6 kb in all tissues examined, with weaker expression of 1.2- and 5.2-kb transcripts. The strongest expression was observed in heart and skeletal muscle. Sequence analysis of a 3-kb cDNA contig revealed an 807-bp open reading frame encoding a putative 268-amino acid protein. Comparison of the sequence with sequences in databases revealed homology with holocytochrome c-type synthetases, which catalyze the covalent addition of a heme group onto c-type cytochromes in mitochondria. The c-type cytochromes are required for proper functioning of the electron transport pathway. The human gene, symbolized HCCS, and the corresponding murine gene characterized by Schaefer et al. (1996) share 83% nucleotide sequence identity and 85% amino acid identity. The authors stated that, because of the lack of a neuromuscular phenotype in MLS, it is uncertain how the deletion of a mitochondrial holocytochrome synthetase would contribute to phenotype seen in MLS. The expression pattern of the gene and knowledge of the function of

holocytochrome synthetases suggested, however, that it is a good candidate for X-linked encephalomyopathies typically associated with mitochondrial dysfunction. Based on its chromosomal location and its role in the mitochondrial respiratory chain, HCCS was considered a candidate gene for Rett syndrome (RTT; 312750). The genomic structure of the gene, which occupies an 11-kb region and consists of 7 exons, was determined. No mutational abnormality of the gene was found in 20 RTT patients (Van den Veyver et al., 1998).

- [66501] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [66502] Schaefer, L.; Ballabio, A.; Zoghbi, H. Y. : Cloning and characterization of a putative human holocytochrome c-type synthetase gene (HCCS) isolated from the critical region for microphthalmia with linear skin defects (MLS). *Genomics* 34: 166–172, 1996. ; and
- [66503] Van den Veyver, I. B.; Subramanian, S.; Zoghbi, H. Y. : Genomic structure of a human holocytochrome c-type synthetase gene in Xp22.3 and mutation analysis in patients with Rett syndrome.
- [66504] Further studies establishing the function and utilities of

HCCS are found in John Hopkins OMIM database record ID 300056, and in cited publications numbered 9005–9006 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Histone Deacetylase 5 (HDAC5, Accession NM\_139205) is another VGAM1958 host target gene. HDAC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC5 BINDING SITE, designated SEQ ID:29223, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66505] Another function of VGAM1958 is therefore inhibition of Histone Deacetylase 5 (HDAC5, Accession NM\_139205), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and mediate transcriptional regulation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC5. The function of HDAC5 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM263.Hepatoma-derived Growth Factor (high-mobility group protein 1-like) (HDGF, Accession NM\_004494) is another VGAM1958 host target gene. HDGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDGF BINDING SITE, designated SEQ ID:10830, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66506] Another function of VGAM1958 is therefore inhibition of Hepatoma-derived Growth Factor (high-mobility group protein 1-like) (HDGF, Accession NM\_004494), a gene which is a heparin-binding protein, with mitogenic activity for fibroblasts. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDGF. The function of HDGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Homeo Box B7 (HOXB7, Accession

NM\_004502) is another VGAM1958 host target gene. HOXB7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB7 BINDING SITE, designated SEQ ID:10837, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66507] Another function of VGAM1958 is therefore inhibition of Homeo Box B7 (HOXB7, Accession NM\_004502), a gene which is a member of homeodomain family of DNA binding proteins; may regulate gene expression, morphogenesis, and differentiation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB7. The function of HOXB7 has been established by previous studies. In mouse, Hoxb7 expression is confined to macrophages. Using RT-PCR, Lill et al. (1995) detected expression of HOXB7 in monocytes differentiated from HL60 cells by stimulation with vitamin D3. Overexpression of HOXB7 inhibited differentiation into granulocytes but

not monocytes. However, RT-PCR analysis failed to detect HOXB7 expression in mature monocytes. HOX proteins have a conserved DNA-binding homeodomain, a pentapeptide motif that mediates interactions with PBX proteins (e.g., PBX1; 176310), and an N-terminal octapeptide motif. Yaron et al. (2001) found that wildtype HOXB7 inhibited differentiation of a murine myelomonocytic cell line, 32D, but that mutations in any of the conserved regions blocked this inhibitory effect. Mutations in casein kinase phosphorylation sites, the glutamate-rich C terminus, or the N-terminal 14 residues of HOXB7 enhanced 32D differentiation.

[66508] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66509] Lill, M. C.; Fuller, J. F.; Herzig, R.; Crooks, G. M.; Gasson, J. C. : The role of the homeobox gene, HOX B7, in human myelomonocytic differentiation. Blood 85: 692-697, 1995. ; and

[66510] Yaron, Y.; McAdara, J. K.; Lynch, M.; Hughes, E.; Gasson, J. C. : Identification of novel functional regions important for the activity of HOXB7 in mammalian cells. J. Immun. 166: 5058-5.

[66511] Further studies establishing the function and utilities of HOXB7 are found in John Hopkins OMIM database record ID 142962, and in cited publications numbered 5207–2659 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box C5 (HOXC5, Accession NM\_018953) is another VGAM1958 host target gene. HOXC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC5 BINDING SITE, designated SEQ ID:21021, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66512] Another function of VGAM1958 is therefore inhibition of Homeo Box C5 (HOXC5, Accession NM\_018953). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC5. 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868) is another VGAM1958 host target gene. HTR2C BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by HTR2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR2C BINDING SITE, designated SEQ ID:6531, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66513] Another function of VGAM1958 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868), a gene which activates phospholipase C and regulates intracellular calcium flux. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR2C. The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1052. Islet Cell Autoantigen 1, 69kDa (ICA1, Accession NM\_022308) is another VGAM1958 host target gene. ICA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of ICA1 BINDING SITE, designated SEQ ID:22738, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66514] Another function of VGAM1958 is therefore inhibition of Islet Cell Autoantigen 1, 69kDa (ICA1, Accession NM\_022308), a gene which Islet cell autoantigen 1. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICA1. The function of ICA1 has been established by previous studies. Pietropaolo et al. (1993) identified a novel 69-kD peptide autoantigen (ICA69) associated with insulin-dependent diabetes mellitus (IDDM) by screening a human islet lambda-gt11 cDNA expression library with cytoplasmic islet cell antibody positive sera from relatives of IDDM patients who progressed to the overt disease. The deduced open reading frame of the ICA69 cDNA predicted a 483-amino acid protein. ICA69 showed no nucleotide or amino acid sequence relation to any known sequence in GenBank except for 2 short regions of similarity with bovine serum albumin (BSA). The ICA69 cDNA probe hybridized with a 2-kb mRNA in polyadenylated RNA from human pancreas, brain, heart,

thyroid, and kidney. The structural gene for ICA69 was designated ICA1. A homolog in the mouse, designated *Ica1*, was mapped to the proximal end of chromosome 6, within 6 cM of the MET protooncogene (OMIM Ref. No. 164860). One can deduce from homology of synteny that the human ICA1 gene is probably located in the region 7q31, which is conserved between mouse and human. Thus, Pietropaolo et al. (1993) added another islet antigen to the isoforms of the neuroendocrine-associated enzyme glutamic acid decarboxylase (GAD; 138275) which react with sera from IDDM patients as well as from patients with stiff-man syndrome (OMIM Ref. No. 184850). However, by isotopic in situ hybridization, Gaedigk et al. (1994) demonstrated that the ICA1 gene maps to human 7p22. Gaedigk et al. (1996) reported that the mouse *Ica1* gene is distributed over more than 100 kb on chromosome 6. The single murine genomic locus contains 14 coding exons, ranging from 39 to 271 bp in length. They found that the human and mouse intron/exon junctions are identical. They cloned cDNAs and identified alternatively spliced mRNA transcripts. All splice variants encoded the conserved T-cell epitope (in exon 2) recognized by autoreactive T cells in diabetic children and diabetes-prone NOD

mice.

[66515] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66516] Gaedigk, R.; Duncan, A. M. V.; Miyazaki, I.; Robinson, B. H.; Dosch, H.-M. : ICA1 encoding p69, a protein linked to the development of type 1 diabetes, maps to human chromosome 7p22. Cytogenet. Cell Genet. 66: 274-276, 1994. ; and

[66517] Gaedigk, R.; Karges, W.; Hui, M. F.; Scherer, S. W.; Dosch, H.-M. : Genomic organization and transcript analysis of ICAp69, a target antigen in diabetic autoimmunity. Genomics 38: 382-39.

[66518] Further studies establishing the function and utilities of ICA1 are found in John Hopkins OMIM database record ID 147625, and in cited publications numbered 11408-11410 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inducible T-cell Co-stimulator (ICOS, Accession NM\_012092) is another VGAM1958 host target gene. ICOS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICOS, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICOS BINDING SITE, designated SEQ ID:14385, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66519] Another function of VGAM1958 is therefore inhibition of Inducible T-cell Co-stimulator (ICOS, Accession NM\_012092), a gene which forms homodimers and functions as an inducible T-cell co-stimulator. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICOS. The function of ICOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18. Isocitrate Dehydrogenase 3 (NAD<sup>+</sup>) Alpha (IDH3A, Accession NM\_005530) is another VGAM1958 host target gene. IDH3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IDH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDH3A BINDING SITE, designated SEQ ID:12052, to the nucleotide sequence of

VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66520] Another function of VGAM1958 is therefore inhibition of Isocitrate Dehydrogenase 3 (NAD<sup>+</sup>) Alpha (IDH3A, Accession NM\_005530), a gene which decarboxylates isocitrate into alpha-ketoglutarate in the TCA cycle. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDH3A. The function of IDH3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349. Interferon (alpha, beta and omega) Receptor 1 (IFNAR1, Accession NM\_000629) is another VGAM1958 host target gene. IFNAR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IFNAR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNAR1 BINDING SITE, designated SEQ ID:6246, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66521] Another function of VGAM1958 is therefore inhibition of

Interferon (alpha, beta and omega) Receptor 1 (IFNAR1, Accession NM\_000629), a gene which is a receptor for interferons alpha and beta. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR1. The function of IFNAR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM904. Interleukin 1 Receptor, Type I (IL1R1, Accession NM\_000877) is another VGAM1958 host target gene. IL1R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1R1 BINDING SITE, designated SEQ ID:6562, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66522] Another function of VGAM1958 is therefore inhibition of Interleukin 1 Receptor, Type I (IL1R1, Accession NM\_000877), a gene which is a receptor for interleukin-1 alpha (il-1a), beta (il-1b), and interleukin-1 receptor antagonist protein (il-1ra). Accordingly, utilities of

VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1R1. The function of IL1R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM704. Inhibin, Beta C (INHBC, Accession NM\_005538) is another VGAM1958 host target gene. INHBC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INHBC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INHBC BINDING SITE, designated SEQ ID:12063, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66523] Another function of VGAM1958 is therefore inhibition of Inhibin, Beta C (INHBC, Accession NM\_005538), a gene which inhibits the secretion of follitropin by the pituitary gland. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBC. The function of INHBC and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM89. Interleukin-1 Receptor-associated Kinase 4 (IRAK4, Accession XM\_028349) is another VGAM1958 host target gene. IRAK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRAK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRAK4 BINDING SITE, designated SEQ ID:30694, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66524] Another function of VGAM1958 is therefore inhibition of Interleukin-1 Receptor-associated Kinase 4 (IRAK4, Accession XM\_028349), a gene which may function as an IRAK1 kinase, triggering a cascade of phosphorylation events. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRAK4. The function of IRAK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1291. Integrin,

Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM\_002203) is another VGAM1958 host target gene. ITGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA2 BINDING SITE, designated SEQ ID:7961, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66525] Another function of VGAM1958 is therefore inhibition of Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM\_002203), a gene which has roles in blood clotting and angiogenesis, acts as a collagen and laminin receptor. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA2. The function of ITGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. Integrin, Alpha 6 (ITGA6, Accession NM\_000210) is another VGAM1958 host target gene.

ITGA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA6 BINDING SITE, designated SEQ ID:5701, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66526] Another function of VGAM1958 is therefore inhibition of Integrin, Alpha 6 (ITGA6, Accession NM\_000210). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA6. JJAZ1 (Accession NM\_015355) is another VGAM1958 host target gene. JJAZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JJAZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JJAZ1 BINDING SITE, designated SEQ ID:17655, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66527] Another function of VGAM1958 is therefore inhibition of

JJAZ1 (Accession NM\_015355), a gene which is a zinc finger protein. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JJAZ1. The function of JJAZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM231. Jumonji Homolog (mouse) (JMJ, Accession NM\_004973) is another VGAM1958 host target gene. JMJ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JMJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JMJ BINDING SITE, designated SEQ ID:11419, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66528] Another function of VGAM1958 is therefore inhibition of Jumonji Homolog (mouse) (JMJ, Accession NM\_004973), a gene which participates in the negative regulation of cell growth. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JMJ. The function of JMJ and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM523. Jerky Homolog (mouse) (JRK, Accession XM\_098818) is another VGAM1958 host target gene. JRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRK BINDING SITE, designated SEQ ID:41837, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66529] Another function of VGAM1958 is therefore inhibition of Jerky Homolog (mouse) (JRK, Accession XM\_098818), a gene which might function as a DNA-binding protein. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JRK. The function of JRK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210. Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1

(KCNAB1, Accession XM\_027634) is another VGAM1958 host target gene. KCNAB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB1 BINDING SITE, designated SEQ ID:30545, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66530] Another function of VGAM1958 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM\_027634), a gene which is the regulatory beta subunit for a shaker-related voltage-gated potassium channel. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB1. The function of KCNAB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM727. Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM\_018658) is another VGAM1958 host target gene.

KCNJ16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNJ16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ16 BINDING SITE, designated SEQ ID:20726, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66531] Another function of VGAM1958 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM\_018658). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ16. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 3 (KCNS3, Accession NM\_002252) is another VGAM1958 host target gene. KCNS3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS3 BINDING SITE, designated SEQ

ID:8049, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66532] Another function of VGAM1958 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Sub-family S, Member 3 (KCNS3, Accession NM\_002252). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS3. Ketohexokinase (fructokinase) (KHK, Accession NM\_006488) is another VGAM1958 host target gene. KHK BINDING SITE1 and KHK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KHK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KHK BINDING SITE1 and KHK BINDING SITE2, designated SEQ ID:13214 and SEQ ID:5729 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66533] Another function of VGAM1958 is therefore inhibition of Ketohexokinase (fructokinase) (KHK, Accession NM\_006488). Accordingly, utilities of VGAM1958 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with KHK. Kinesin Family Member 5C (KIF5C, Accession NM\_004522) is another VGAM1958 host target gene. KIF5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:10853, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66534] Another function of VGAM1958 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM\_004522). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. Kinesin-like 3 (KNSL3, Accession NM\_005355) is another VGAM1958 host target gene. KNSL3 BINDING SITE1 and KNSL3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KNSL3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of KNSL3 BINDING SITE1 and KNSL3 BINDING SITE2, designated SEQ ID:11824 and SEQ ID:24962 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66535] Another function of VGAM1958 is therefore inhibition of Kinesin-like 3 (KNSL3, Accession NM\_005355), a gene which may function in intracellular transport and mitosis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KNSL3. The function of KNSL3 has been established by previous studies. Janatipour et al. (1992) identified the HSET gene within a segment centromeric to the class II gene region of the human major histocompatibility complex. By screening a human testis library with a cDNA corresponding to Tctex7, the mouse homolog of HSET, Ando et al. (1994) isolated human HSET cDNAs. Northern blot analysis revealed that the 2.4-kb HSET mRNA is expressed in several human cell lines. The C-terminal 350 amino acids of the predicted HSET protein share extensive homology with the ATP-binding and motor domains of kinesin heavy chain (OMIM Ref. No. 148760) and the kinesin-related proteins CENPE (OMIM

Ref. No. 117143) and MKLP1. Although the mechanochemical domain of kinesin and kinesin-like proteins is generally located within the N-terminal region, HSET contains a C-terminal mechanochemical domain. This 'reversed' structural organization is also found in the *S. cerevisiae* KAR3 and *Drosophila* Ncd kinesin-like proteins. Molecular motors move directionally to either the plus or the minus ends of microtubules or actin filaments. For example, kinesin (see OMIM Ref. No. 600025) moves towards the plus end, whereas the *Drosophila* Ncd motor moves towards the minus end. Endow and Higuchi (2000) showed that an asn340-to-lys mutation in the 'neck' (the region between the stalk and the C-terminal motor domain) of Ncd, which corresponds to a KAR3 mutation obtained in a yeast suppressor screen (Hoyt et al., 1993), causes the motor to abruptly reverse directions and move toward either the plus or minus end. Velocity in mutant and wildtype was identical, indicating that the neck was functional. Mutation of lys640, which is located in the motor-core region and touches asn340 in crystal structures, to asn caused the same phenotype. Analysis of a double mutant for these residues, which did not revert to minus-end directionality, indicated that the highly con-

served residues do not interact normally in an inverted configuration. Endow and Higuchi (2000) concluded that directional bias is dependent on neck/motor-core interactions.

[66536] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66537] Janatipour, M.; Naumov, Y.; Ando, A.; Sugimura, K.; Okamoto, N.; Tsuji, K.; Abe, K.; Inoko, H. : Search for MHC-associated genes in human: five new genes centromeric to HLA-DP with yet unknown functions. Immunogenetics 35: 272-278, 1992. ; and

[66538] Janitz, K.; Wild, A.; Beck, S.; Savasta, S.; Beluffi, G.; Ziegler, A.; Volz, A. : Genomic organization of the HSET locus and the possible association of HLA-linked genes with immotile ci.

[66539] Further studies establishing the function and utilities of KNSL3 are found in John Hopkins OMIM database record ID 603815, and in cited publications numbered 491 and 12002 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LANGERIN (Accession NM\_015717) is another VGAM1958 host target gene. LANGERIN BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LANGERIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANGERIN BINDING SITE, designated SEQ ID:17931, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66540] Another function of VGAM1958 is therefore inhibition of LANGERIN (Accession NM\_015717), a gene which could be involved in endocytosis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANGERIN. The function of LANGERIN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM688. Low Density Lipoprotein Receptor (familial hypercholesterolemia) (LDLR, Accession NM\_000527) is another VGAM1958 host target gene. LDLR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LDLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of LDLR BINDING SITE, designated SEQ ID:6128, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66541] Another function of VGAM1958 is therefore inhibition of Low Density Lipoprotein Receptor (familial hypercholesterolemia) (LDLR, Accession NM\_000527), a gene which also acts as a tumor suppressor. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDLR. The function of LDLR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1030. LENG4 (Accession NM\_024298) is another VGAM1958 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23584, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66542] Another function of VGAM1958 is therefore inhibition of LENG4 (Accession NM\_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259. LNK (Accession NM\_005475) is another VGAM1958 host target gene. LNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:11974, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66543] Another function of VGAM1958 is therefore inhibition of LNK (Accession NM\_005475), a gene which links T-cell receptor activation signal to phospholipase c-gamma-1, grb-2 and phosphatidylinositol 3-kinase (by similarity). Accordingly, utilities of VGAM1958 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with LNK. The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM115. Lipoprotein Lipase (LPL, Accession NM\_000237) is another VGAM1958 host target gene. LPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPL BINDING SITE, designated SEQ ID:5749, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66544] Another function of VGAM1958 is therefore inhibition of Lipoprotein Lipase (LPL, Accession NM\_000237), a gene which is the hydrolysis of triglycerides of circulating chylomicrons and very low density lipoproteins (vldl). the enzyme functions in the presence of apolipoprotein c-2 on the luminal surface of vascular. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPL. The function of LPL and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM\_011181) is another VGAM1958 host target gene. LRAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRAT BINDING SITE, designated SEQ ID:30180, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66545] Another function of VGAM1958 is therefore inhibition of Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM\_011181). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRAT. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM\_035037) is another VGAM1958 host target gene. LRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP4 BINDING SITE, designated SEQ ID:32202, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66546] Another function of VGAM1958 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM\_035037). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM\_006767) is another VGAM1958 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13637, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66547] Another function of VGAM1958 is therefore inhibition of

Leucine–zipper–like Transcriptional Regulator, 1 (LZTR1, Accession NM\_006767). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1. V–maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog F (avian) (MAFF, Accession NM\_012323) is another VGAM1958 host target gene. MAFF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAFF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAFF BINDING SITE, designated SEQ ID:14701, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66548] Another function of VGAM1958 is therefore inhibition of V–maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog F (avian) (MAFF, Accession NM\_012323), a gene which Binds to the US–2 motif of the oxytocin receptor gene; has a leucine zipper structure. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAFF. The function of MAFF and its association with vari–

ous diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1928. Mannosidase, Alpha, Class 2A, Member 2 (MAN2A2, Accession NM\_006122) is another VGAM1958 host target gene. MAN2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN2A2 BINDING SITE, designated SEQ ID:12766, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66549] Another function of VGAM1958 is therefore inhibition of Mannosidase, Alpha, Class 2A, Member 2 (MAN2A2, Accession NM\_006122), a gene which is an enzyme involved in the processing of N-linked glycans. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN2A2. The function of MAN2A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1794.Microtubule-associated Protein 2 (MAP2, Accession NM\_031846) is another VGAM1958 host target gene. MAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2 BINDING SITE, designated SEQ ID:25581, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66550] Another function of VGAM1958 is therefore inhibition of Microtubule-associated Protein 2 (MAP2, Accession NM\_031846), a gene which may act in stabilizing microtubules against depolymerization.also seems to have a stiffening effect on microtubules. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2. The function of MAP2 has been established by previous studies. For nerve cells to develop their highly polarized form, appropriate structural molecules must be targeted to either axons or dendrites. This could be achieved by the synthesis of structural proteins in the cell body and their sorting to either axons or dendrites by specific

transport mechanisms. For dendrites, an alternative possibility is that proteins could be synthesized locally in the dendritic cytoplasm. This would allow regulation of the production of structural molecules in response to local demand during dendritic development. The existence of dendritic polyribosomes and the demonstration that newly synthesized RNA is transported into the dendrites of neurons differentiating in culture support the feasibility of dendritic protein synthesis. By in situ hybridization with specific cDNA probes, Garner et al. (1988) showed that mRNA for the dendrite-specific microtubule-associated protein MAP2 was present in dendrites in the developing brain. By contrast, the mRNA for tubulin (OMIM Ref. No. 191120), a protein present in both axons and dendrites, was localized exclusively in neuronal cell bodies. Animal model experiments lend further support to the function of MAP2. Marsden et al. (1996) produced transgenic mice that overexpress embryonic Map2 (referred to by them as MAP2c) without inducing detectable effects on the morphology of neurons. The transgenic MAP2c was present in dendrites but not in axons but transgenic MAP2c messenger RNA was limited to cell bodies. The authors concluded that dendritic localization of transgenic MAP2c protein

was not the result of previous transport of its mRNA but implies the existence of a protein-based mechanism capable of sorting MAP2 protein isoforms

[66551] It is appreciated that the abovementioned animal model for MAP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[66552] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66553] Garner, C. C.; Tucker, R. P.; Matus, A. : Selective localization of messenger RNA for cytoskeletal protein MAP2 in dendrites. *Nature* 336: 674–677, 1988. ; and

[66554] Marsden, K. M.; Doll, T.; Ferralli, J.; Botteri, F.; Matus, A. : Transgenic expression of embryonic MAP2 in adult mouse brain: implications for neuronal polarization. *J. Neurosci.* 16: 3265–.

[66555] Further studies establishing the function and utilities of MAP2 are found in John Hopkins OMIM database record ID 157130, and in sited publications numbered 10752–10756 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase Kinase 2 (MAP2K2,

Accession NM\_030662) is another VGAM1958 host target gene. MAP2K2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAP2K2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K2 BINDING SITE, designated SEQ ID:24995, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66556] Another function of VGAM1958 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 2 (MAP2K2, Accession NM\_030662), a gene which is a signaling intermediate, activates ERK1. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K2. The function of MAP2K2 has been established by previous studies. See MEK1 (OMIM Ref. No. 176872). Zheng and Guan (1993) isolated and sequenced 2 human cDNAs encoding members of the MAP kinase kinase (MAP2K) family, designated MEK1 and MEK2 by them. The MEK2 cDNA encodes a predicted 400-amino acid protein that shares 80% sequence identity with human MEK1. Zheng and Guan

(1993) showed that recombinant MEK2 and MEK1 both could activate human ERK1 (OMIM Ref. No. 601795) in vitro. They further characterized biochemically the 2 MAP2Ks. Influenza A viruses are significant causes of morbidity and mortality worldwide. Annually updated vaccines may prevent disease, and antivirals are effective treatment early in disease when symptoms are often non-specific. Viral replication is supported by intracellular signaling events. Using U0126, a nontoxic inhibitor of MEK1 and MEK2, and thus an inhibitor of the RAF1 (OMIM Ref. No. 164760)/MEK/ERK pathway (see OMIM Ref. No. Favata et al. (1998)), Pleschka et al. (2001) examined the cellular response to infection with influenza A. U0126 suppressed both the early and late ERK activation phases after virus infection. Inhibition of the signaling pathway occurred without impairing the synthesis of viral RNA or protein, or the import of viral ribonucleoprotein complexes (RNP) into the nucleus. Instead, U0126 inhibited RAF/MEK/ERK signaling and the export of viral RNP without affecting the cellular mRNA export pathway. Pleschka et al. (2001) proposed that ERK regulates a cellular factor involved in the viral nuclear export protein function. They suggested that local application of MEK inhibitors may have only minor

toxic effects on the host while inhibiting viral replication without giving rise to drug-resistant virus variants

[66557] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66558] Zheng, C. F.; Guan, K. L. : Cloning and characterization of two distinct human extracellular signal-regulated kinase activator kinases, MEK1 and MEK2. J. Biol. Chem. 268: 11435–11439, 1993. ; and

[66559] Pleschka, S.; Wolff, T.; Ehrhardt, C.; Hobom, G.; Planz, O.; Rapp, U. R.; Ludwig, S. : Influenza virus propagation is impaired by inhibition of the Raf/MEK/ERK signalling cascade. Nature Ce.

[66560] Further studies establishing the function and utilities of MAP2K2 are found in John Hopkins OMIM database record ID 601263, and in cited publications numbered 10344, 10346–10348, 1035 and 10356 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM\_138957) is another VGAM1958 host target gene. MAPK1 BINDING SITE1 and MAPK1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK1, corresponding to

HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK1 BINDING SITE1 and MAPK1 BINDING SITE2, designated SEQ ID:29063 and SEQ ID:8616 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66561] Another function of VGAM1958 is therefore inhibition of Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM\_138957), a gene which phosphorylates microtubule-associated protein-2 (map2). myelin basic protein (mbp), and elk-1; may promote entry in the cell cycle. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK1. The function of MAPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Mitogen-activated Protein Kinase 9 (MAPK9, Accession NM\_139068) is another VGAM1958 host target gene. MAPK9 BINDING SITE1 through MAPK9 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK9, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK9 BINDING SITE1 through MAPK9 BINDING SITE4, designated SEQ ID:29135, SEQ ID:29137, SEQ ID:29139 and SEQ ID:8630 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66562] Another function of VGAM1958 is therefore inhibition of Mitogen-activated Protein Kinase 9 (MAPK9, Accession NM\_139068), a gene which Member of the MAP kinase family, regulates c-Jun in response to proinflammatory cytokines and UV irradiation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK9. The function of MAPK9 has been established by previous studies. The transcriptional activity of the c-Jun protooncoprotein (see OMIM Ref. No. 165160) is augmented through phosphorylation at 2 sites by c-Jun amino-terminal kinases (JNKs). Using in-gel kinase assays, Hibi et al. (1993) identified 2 JNKs, 46 and 55 kD in size. The 46-kD protein JNK1 (OMIM Ref. No. 601158) was shown to be a member of the mitogen-activated protein kinase (MAPK) family. Using a JNK1 cDNA as a probe, Kallunki et

al. (1994) and Sluss et al. (1994) isolated cDNAs encoding the 55-kD protein, which both designated JNK2. Kallunki et al. (1994) reported that the sequence of the predicted 424-amino acid JNK2 protein is 83% identical to that of JNK1. Both JNKs contain a Thr-Pro-Tyr phosphorylation motif. Expression of JNK2 in mammalian cells potentiated activation of a c-Jun-responsive promoter, while expression of JNK1 had no effect. Using in vitro binding assays, Kallunki et al. (1994) found that JNK2 bound c-Jun approximately 25 times more efficiently than did JNK1. The authors traced this difference to a small beta-strand-like region near the catalytic pocket of the enzyme. Northern blot analysis revealed that JNK2 is expressed as multiple transcripts in many cell types. Sluss et al. (1994) demonstrated that both UV radiation and the proinflammatory cytokine TNF- $\alpha$  (OMIM Ref. No. 191160) induce JNK1 and JNK2. Animal model experiments lend further support to the function of MAPK9. Tournier et al. (2000) demonstrated that JNK is required for UV-induced apoptosis in primary murine embryonic fibroblasts. Fibroblasts with simultaneous targeted disruptions of JNK1 and JNK2 genes were protected against UV-stimulated apoptosis. The absence of JNK caused a defect in the mitochondrial death

signaling pathway, including the failure to release cytochrome c. These data indicated that mitochondria are influenced by proapoptotic signal transduction through the JNK pathway. Dong et al. (2000) used 3 new mouse models in which peripheral T cells completely lack JNK proteins or signaling to test whether the JNK signaling pathway is crucial for IL2 expression and T-cell activation. Unexpectedly, these T cells made more IL2 (OMIM Ref. No. 147680) and proliferated better than wildtype cells. However, production of effector T-cell cytokines did require JNK. Thus, Dong et al. (2000) concluded that JNK is necessary for T-cell differentiation but not for naive T-cell activation

[66563] It is appreciated that the abovementioned animal model for MAPK9 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[66564] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66565] Dong, C.; Yang, D. D.; Tournier, C.; Whitmarsh, A. J.; Xu, J.; Davis, R. J.; Flavell, R. A. : JNK is required for effector T-cell function but not for T-cell activation. Nature 405:

91–94, 2000. ; and

[66566] Kallunki, T.; Su, B.; Tsigelny, I.; Sluss, H. K.; Derijard, B.; Moore, G.; Davis, R.; Karin, M. : JNK2 contains a specificity–determining region responsible for efficient c–Jun binding and.

[66567] Further studies establishing the function and utilities of MAPK9 are found in John Hopkins OMIM database record ID 602896, and in cited publications numbered 9463, 9464–590 and 9465 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Microtubule–associated Protein Tau (MAPT, Accession NM\_005910) is another VGAM1958 host target gene. MAPT BINDING SITE1 through MAPT BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPT BINDING SITE1 through MAPT BINDING SITE4, designated SEQ ID:12541, SEQ ID:18829, SEQ ID:18835 and SEQ ID:18841 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66568] Another function of VGAM1958 is therefore inhibition of Microtubule-associated Protein Tau (MAPT, Accession NM\_005910), a gene which Microtubule-associated protein tau; promotes microtubule assembly. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPT. The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. MAX Protein (MAX, Accession NM\_145112) is another VGAM1958 host target gene. MAX BINDING SITE1 and MAX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAX BINDING SITE1 and MAX BINDING SITE2, designated SEQ ID:29716 and SEQ ID:8199 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66569] Another function of VGAM1958 is therefore inhibition of MAX Protein (MAX, Accession NM\_145112), a gene which

interacts specifically with the MYC (190080) protein . Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAX. The function of MAX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923. MCM2 Minichromosome Maintenance Deficient 2, Mitotin (*S. cerevisiae*) (MCM2, Accession XM\_042618) is another VGAM1958 host target gene. MCM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCM2 BINDING SITE, designated SEQ ID:33721, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66570] Another function of VGAM1958 is therefore inhibition of MCM2 Minichromosome Maintenance Deficient 2, Mitotin (*S. cerevisiae*) (MCM2, Accession XM\_042618), a gene which Minichromosome maintenance protein; binds chromatin and regulates entry into S phase. Accordingly, utili-

ties of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCM2. The function of MCM2 has been established by previous studies. The replication of DNA occurs only once per cell cycle in eukaryotes. Blow and Laskey (1988) attempted to explain this tight control by proposing the existence of a hypothetical licensing factor that would bind to chromatin during mitosis to permit DNA replication during the ensuing S phase in *Xenopus* egg extracts. Kubota et al. (1995), Chong et al. (1995), and Madine et al. (1995) identified a replication licensing activity in a complex containing MCM/P1 family proteins in *Xenopus* oocytes. Burkhart et al. (1995) showed that human MCM2 and MCM5 (OMIM Ref. No. 602696) proteins form a complex. Hu et al. (1993) reported cDNA sequences for 5 MCM/P1 family members. MCM2, also called CDCL1 and BM28, is a human nuclear protein that may play an important role in 2 crucial steps of the cell cycle, namely, onset of DNA replication and cell division. It is similar to members of the family of early S-phase proteins. Using plasmid DNA containing the complete coding sequence of the CDCL1 gene as a probe for fluorescence in situ hybridization, Mincheva et al. (1994) mapped the gene to 3q21.

From its localization, CDCL1 became a candidate for an oncogene affected by chromosomal breaks in acute myeloid leukemia (AML). Tsuruga et al. (1997) reported the comparative analysis of the human MCM proteins MCM2, MCM3 (OMIM Ref. No. 602693), MCM5, and MCM7 (OMIM Ref. No. 600592). The 4 MCM proteins underwent unequal regulation, suggesting that they play somewhat distinct roles in the regulation of the mammalian cell cycle. The mRNA levels of these genes underwent cell cycle-dependent oscillations with a peak at G1/S phase; they may be regulated by E2F motifs (see OMIM Ref. No. E2F1; 189971), 2 of which were detected in the 5-prime regulatory region of the MCM5 gene. In contrast, the levels of these MCM proteins remained rather constant during the HeLa cell cycle. However, their levels gradually increased in a variable manner as normal cells progressed from G0 into the G1/S phase. In the G0 stage, the MCM2 and MCM5 proteins were much less abundant than the MCM7 and MCM3 proteins. This suggests that the MCM proteins are not present in stoichiometric amounts and that only a proportion of these molecules actively participate in cell cycle regulation as part of MCM complexes. Using an improved method for constructing conditional degron mu-

tants, Labib et al. (2000) demonstrated that depletion of minichromosome maintenance protein complexes after initiation irreversibly blocks the progression of replication forks in *S. cerevisiae*. Their experiments demonstrated that MCM complex is loaded at origins before initiation and is essential for elongation. Disruption of any one of the MCMs resulted in cells that were unable to complete the S phase, indicating that all MCM proteins are equally important for chromosome replication to continue after the activation of early origins of DNA replication. Labib et al. (2000) concluded that restricting MCM loading to the G1 phase ensures that initiation and elongation occur just once per cell cycle. Nomenclature: This gene has also been referred to as *cdc19* and D3S3194. See MCM7 (OMIM Ref. No. 600592), which also has been referred to as MCM2.

[66571] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66572] Blow, J. J.; Laskey, R. A. : A role for the nuclear envelope in controlling DNA replication within the cell cycle. *Nature* 332: 546–548, 1988. ; and

[66573] Burkhardt, R.; Schulte, D.; Hu, D.; Musahl, C.; Gohring, F.;

Knippers, R. : Interactions of human nuclear proteins P1Mcm3 and P1Cdc46. *Europ. J. Biochem.* 228: 431–438, 1995.

[66574] Further studies establishing the function and utilities of MCM2 are found in John Hopkins OMIM database record ID 116945, and in cited publications numbered 1923–1931 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Multiple Endocrine Neoplasia I (MEN1, Accession XM\_167804) is another VGAM1958 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:44840, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66575] Another function of VGAM1958 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM\_167804). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Mesenchyme Homeo

Box 1 (MEOX1, Accession NM\_004527) is another VGAM1958 host target gene. MEOX1 BINDING SITE1 and MEOX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MEOX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEOX1 BINDING SITE1 and MEOX1 BINDING SITE2, designated SEQ ID:10864 and SEQ ID:15188 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66576] Another function of VGAM1958 is therefore inhibition of Mesenchyme Homeo Box 1 (MEOX1, Accession NM\_004527), a gene which plays a role in mesoderm induction and isomitogenesis, and sclerotomal differentiation . Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEOX1. The function of MEOX1 has been established by previous studies. Using the technique of solution hybridization coupled with magnetic bead capture for the generation of a transcript map for the BRCA1 (OMIM Ref. No. 113705) region of 17q21,

Futreal et al. (1994) isolated the human homolog of the mouse Mox1 gene (termed MOX1 by them) which had previously been localized to a region of syntenic homology on mouse chromosome 11. MOX1 expression was observed in a variety of normal tissues examined, including breast and ovary. Because of this and because the gene contains a homeo box domain and has the potential to regulate growth and differentiation, MOX1 represented an attractive candidate for the BRCA1 gene. However, no evidence for mutation in the coding sequence was found in investigations of a series of BRCA1 kindreds and primary sporadic breast tumors. Nonetheless, the widespread expression of MOX1 in nonembryonic tissues suggests a role in normal cell biology. In the course of preparing a detailed physical and transcriptional map of the BRCA1 region, Jones et al. (1994) likewise located the MEOX1 gene, termed MOX1 by the authors. Another member of this gene family, MEOX2 (OMIM Ref. No. 600535), is located on chromosome 7p.

[66577] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

J.; Hobbs, M.; Bennett, L. M.; Haugen–Strano, A.; Marks, J.; Barrett, J. C.; Tavtigian, S. V.; Shattuck–Eidens, D.; Kamb, A.; Skolnick, M.; Wiseman, R. W. : Isolation of a diverged homeobox gene, MOX1, from the BRCA1 region on 17q21 by solution hybrid capture. Hum. Molec. Genet. 3: 1359–1364, 1994. ; and

[66579] Jones, K. A.; Black, D. M.; Brown, M. A.; Griffiths, B. L.; Nicolai, H. M.; Chambers, J. A.; Bonjardim, M.; Xu, C.–F.; Boyd, M.; McFarlane, R.; Korn, B.; Poustka, A.; North, M. A.; Scha.

[66580] Further studies establishing the function and utilities of MEOX1 are found in John Hopkins OMIM database record ID 600147, and in cited publications numbered 1335–1336 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mannosyl (alpha–1,6–)–glycoprotein Beta–1,6–N–acetyl–glucosaminyltransferase (MGAT5, Accession NM\_002410) is another VGAM1958 host target gene. MGAT5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of MGAT5 BINDING SITE, designated SEQ ID:8238, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66581] Another function of VGAM1958 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM\_002410). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT5. Antigen Identified By Monoclonal Antibody Ki-67 (MKI67, Accession NM\_002417) is another VGAM1958 host target gene. MKI67 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKI67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKI67 BINDING SITE, designated SEQ ID:8255, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66582] Another function of VGAM1958 is therefore inhibition of Antigen Identified By Monoclonal Antibody Ki-67 (MKI67, Accession NM\_002417), a gene which thought to be re-

quired for maintaining cell proliferation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKI67. The function of MKI67 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786. Matrix Metalloproteinase 15 (membrane-inserted) (MMP15, Accession NM\_002428) is another VGAM1958 host target gene. MMP15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MMP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP15 BINDING SITE, designated SEQ ID:8265, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66583] Another function of VGAM1958 is therefore inhibition of Matrix Metalloproteinase 15 (membrane-inserted) (MMP15, Accession NM\_002428). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP15. MAX Binding Protein (MNT, Accession

NM\_020310) is another VGAM1958 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21558, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66584] Another function of VGAM1958 is therefore inhibition of MAX Binding Protein (MNT, Accession NM\_020310). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Myeloperoxidase (MPO, Accession NM\_000250) is another VGAM1958 host target gene. MPO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPO BINDING SITE, designated SEQ ID:5786, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66585] Another function of VGAM1958 is therefore inhibition of Myeloperoxidase (MPO, Accession NM\_000250), a gene which is present in primary granules of neutrophilic granulocytes. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPO. The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1915. Metallothionein-like 5, Testis-specific (tesmin) (MTL5, Accession NM\_004923) is another VGAM1958 host target gene. MTL5 BINDING SITE1 and MTL5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MTL5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTL5 BINDING SITE1 and MTL5 BINDING SITE2, designated SEQ ID:11359 and SEQ ID:11358 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66586] Another function of VGAM1958 is therefore inhibition of Metallothionein-like 5, Testis-specific (tesmin) (MTL5, Ac-

cession NM\_004923), a gene which functions in metal homeostasis and protects against heavy-metal toxicity. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTL5. The function of MTL5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM958. Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458) is another VGAM1958 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17748, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66587] Another function of VGAM1958 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM379. Myosin X (MYO10, Accession NM\_012334) is another VGAM1958 host target gene. MYO10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO10 BINDING SITE, designated SEQ ID:14729, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66588] Another function of VGAM1958 is therefore inhibition of Myosin X (MYO10, Accession NM\_012334), a gene which is an unconventional myosin. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO10. The function of MYO10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. N-acetylglucosaminidase, Alpha- (Sanfilippo

disease IIIB) (NAGLU, Accession NM\_000263) is another VGAM1958 host target gene. NAGLU BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NAGLU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAGLU BINDING SITE, designated SEQ ID:5804, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66589] Another function of VGAM1958 is therefore inhibition of N-acetylglucosaminidase, Alpha- (Sanfilippo disease IIIB) (NAGLU, Accession NM\_000263). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAGLU. N-ethylmaleimide-sensitive Factor Attachment Protein, Beta (NAPB, Accession XM\_046652) is another VGAM1958 host target gene. NAPB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPB BINDING SITE, designated

SEQ ID:34769, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66590] Another function of VGAM1958 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Beta (NAPB, Accession XM\_046652). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPB. Neuron Navigator 2 (NAV2, Accession XM\_012028) is another VGAM1958 host target gene. NAV2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAV2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAV2 BINDING SITE, designated SEQ ID:30206, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66591] Another function of VGAM1958 is therefore inhibition of Neuron Navigator 2 (NAV2, Accession XM\_012028), a gene which plays an important role in neuronal development, including neurite outgrowth. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with NAV2. The function of NAV2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481. Neurocalcin Delta (NCALD, Accession NM\_032041) is another VGAM1958 host target gene. NCALD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCALD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCALD BINDING SITE, designated SEQ ID:25744, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66592] Another function of VGAM1958 is therefore inhibition of Neurocalcin Delta (NCALD, Accession NM\_032041). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCALD. Neural Cell Adhesion Molecule 1 (NCAM1, Accession NM\_000615) is another VGAM1958 host target gene. NCAM1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by NCAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCAM1 BINDING SITE, designated SEQ ID:6216, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66593] Another function of VGAM1958 is therefore inhibition of Neural Cell Adhesion Molecule 1 (NCAM1, Accession NM\_000615), a gene which is involved in neuron–neuron adhesion, neurite fasciculation, outgrowth of neurites, etc. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCAM1. The function of NCAM1 has been established by previous studies. Because of evidence indicating close homology of neural cell adhesion molecule (NCAM) in man and mouse, a murine cDNA probe for NCAM could be used directly for in situ hybridization to human metaphase chromosomes (Nguyen et al., 1985). This procedure indicated that the NCAM gene is located at 11q22–q23. Mietus–Snyder et al. (1989) corroborated the location of the NCAM gene to the 11q23 region by finding linkage to the apolipoprotein gene clus–

ter, APOA1--APOC3--APOA4 (107680, 107720, 107690); a maximum lod score of 3.65 at  $\theta = 0.10$  was observed. Further studies by Mietus-Snyder et al. (1990) showed a maximum lod score of 15.9 at a recombination fraction of 0.028. D'Eustachio et al. (1985) mapped the NCAM gene to mouse chromosome 9 by means of a genomic probe in somatic cell hybrids. The gene is close to two others on mouse 9 whose expression is related to the nervous system, namely Thy-1 (see OMIM Ref. No. 188230 for the human counterpart) and the cerebellar connectional mutant staggerer (sg); NCAM-associated DNA polymorphisms were used in recombinant inbred strains of mice to show these linkages as well as close linkage to Sep-1 (apolipoprotein 1) and Lap-1 (leucine aminopeptidase 1). Great structural diversity in NCAM is due to transcriptional variations of a single gene and posttranslational mechanisms which are under exquisite developmental control (Rutishauser and Goridis, 1986). The neural cell adhesion molecule appears on early embryonic cells and is important in the formation of cell collectives and their boundaries at sites of morphogenesis. Later in development it is found on various differentiated tissues and is a major CAM mediating adhesion among

neurons and between neurons and muscle. NCAM is a membrane-bound glycoprotein that plays a role in cell-cell and cell-matrix adhesion through both its homophilic and heterophilic binding activity. To investigate the significance of this binding, Rabinowitz et al. (1996) used a gene targeting strategy in embryonic stem (ES) cells to replace the membrane-associated form of NCAM with a soluble, secreted form of its extracellular domain. Although the heterozygous mutant ES cells were able to generate low coat color chimeric mice, only the wildtype allele was transmitted, suggesting the possibility of dominant lethality. Analysis of chimeric embryos with a high level of ES cell contribution revealed severe growth retardation and morphologic defects by embryonic days 8.5–9.5. The second allele was also targeted and embryos derived almost entirely from the homozygous mutant ES cells exhibited the same lethal phenotype as observed with heterozygous chimeras

[66594] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66595] D'Eustachio, P.; Owens, G. C.; Edelman, G. M.; Cunningham, B. A. : Chromosomal location of the gene encoding

the neural cell adhesion molecule (N-CAM) in the mouse.

Proc. Nat. Acad. Sci. 82: 7631–7635, 1985. ; and

[66596] Rabinowitz, J. E.; Rutishauser, U.; Magnuson, T. : Targeted mutation of Ncam to produce a secreted molecule results in a dominant embryonic lethality. Proc. Nat. Acad. Sci. 93: 6421–64.

[66597] Further studies establishing the function and utilities of NCAM1 are found in John Hopkins OMIM database record ID 116930, and in cited publications numbered 11041, 12049–1205 and 12123–12130 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Receptor Coactivator 3 (NCOA3, Accession NM\_006534) is another VGAM1958 host target gene. NCOA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA3 BINDING SITE, designated SEQ ID:13282, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66598] Another function of VGAM1958 is therefore inhibition of

Nuclear Receptor Coactivator 3 (NCOA3, Accession NM\_006534), a gene which directly binds nuclear receptors and stimulates the transcriptional activities in hormone-dependent fashion. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA3. The function of NCOA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215.N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243) is another VGAM1958 host target gene. NDRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG1 BINDING SITE, designated SEQ ID:29968, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66599] Another function of VGAM1958 is therefore inhibition of N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243), a gene which may have a growth inhibitory

role. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG1. The function of NDRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 3 (NFATC3, Accession NM\_004555) is another VGAM1958 host target gene. NFATC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NFATC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFATC3 BINDING SITE, designated SEQ ID:10897, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66600] Another function of VGAM1958 is therefore inhibition of Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 3 (NFATC3, Accession NM\_004555), a gene which plays a role in the inducible expression of cytokine genes in t cells. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with NFATC3. The function of NFATC3 has been established by previous studies. The activation of NFAT proteins is controlled by calcineurin, the calmodulin-dependent phosphatase. Aramburu et al. (1998) identified a short conserved sequence in the NFATC3 protein (residues 110–122) that targets calcineurin to NFAT. Mutation of a single residue in this sequence impairs the calcineurin-mediated dephosphorylation and nuclear translocation of NFAT1. Peptides spanning the region inhibit the ability of calcineurin to bind to and dephosphorylate NFAT proteins, without affecting the phosphatase activity of calcineurin against other substrates. When expressed intracellularly, a corresponding peptide inhibits NFAT dephosphorylation, nuclear translocation, and NFAT-mediated expression in response to stimulation. Thus, disruption of the enzyme-substrate docking interaction that directs calcineurin to NFAT can effectively block NFAT-dependent functions. Animal model experiments lend further support to the function of NFATC3. Rengarajan et al. (2002) generated *Nfatc2* and *Nfatc3* double-knockout (DKO) mice. They found that *Nfatc2* and *Nfatc3* are critical in the determination of the fate of precursor T helper (Th) cells. DKO T cells intrinsi-

cally differentiated into Th2 cytokine-secreting cells, even in the absence of IL4 (OMIM Ref. No. 147780). Treatment of DKO mice with IL12 (OMIM Ref. No. 161561) and anti-IL4, however, enabled the cells to become gamma-interferon (IFNG; 147570)-secreting Th1 lymphocytes. In addition, the cells from the DKO mice were hyperresponsive to T-cell receptor (TCR; OMIM Ref. No. 186880)-mediated activation and did not require the engagement of the accessory receptor, CD28 (OMIM Ref. No. 186760), for proliferation.

[66601] It is appreciated that the abovementioned animal model for NFATC3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[66602] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66603] Rengarajan, J.; Tang, B.; Glimcher, L. H. : NFATc2 and NFATc3 regulate TH2 differentiation and modulate TCR-responsiveness of naive TH cells. *Nature Immun.* 3: 48-54, 2002. ; and

[66604] Aramburu, J.; Garcia-Cozar, F.; Raghavan, A.; Okamura, H.; Rao, A.; Hogan, P. G. : Selective inhibition of NFAT activation by a peptide spanning the calcineurin targeting

site of NFAT. Mol.

[66605] Further studies establishing the function and utilities of NFATC3 are found in John Hopkins OMIM database record ID 602698, and in cited publications numbered 9903, 7968, 990 and 10195 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Factor (erythroid-derived 2), 45kDa (NFE2, Accession NM\_006163) is another VGAM1958 host target gene. NFE2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NFE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFE2 BINDING SITE, designated SEQ ID:12818, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66606] Another function of VGAM1958 is therefore inhibition of Nuclear Factor (erythroid-derived 2), 45kDa (NFE2, Accession NM\_006163), a gene which regulates expression of the beta globin gene. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2. The function of NFE2 has been established by previous studies. Peters

et al. (1993) demonstrated that the Nfe2 gene in the mouse maps to chromosome 15 in a region containing the microcytic anemia (mk) gene. Homozygous mk mice were shown by Bannerman et al. (1972) to have defective intestinal iron transport and severe anemia. Peters et al. (1993) demonstrated Nfe2 expression in the mouse small intestine and NF-E2 binding activity in nuclear extracts of a human colon carcinoma cell line (OMIM Ref. No. Caco-2). Caco-2 cells possess properties of the small intestine, including the ability to transport iron. These data together indicated that NF-E2 plays a role in all aspects of hemoglobin production: globin synthesis, heme synthesis, and the procurement of iron. (NF-E2 recognition sites are present not only in the locus control regions of the globin genes but also in the gene promoters of 2 heme biosynthetic enzymes, uroporphobilinogen deaminase (OMIM Ref. No. 176000) and ferrochelatase (OMIM Ref. No. 177000).) The 45-kD subunit of the human globin locus control region binding protein, NFE2, was cloned by homology to the murine gene. Immunoprecipitation experiments demonstrated in vivo association of the p45 subunit with an 18-kD protein (see OMIM Ref. No. MAFG, 602020, and MAFK, 600197). Because bZIP proteins bind DNA as

dimers, it is likely that native NFE2 is a heterodimer of 45- and 18-kD subunits. By fluorescence in situ hybridization, Weremowicz et al. (1993) assigned the p45 subunit of NFE2 to 12q13. Chan et al. (1993) likewise cloned the human homolog of mouse NF-E2. Extensive survey of human tissue samples found that NFE2 expression is not limited to erythropoietic organs. Expression in the colon and testis suggested that NFE2 may participate in the regulation of genes other than globin

[66607] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66608] Shivdasani, R. A.; Rosenblatt, M. F.; Zucker-Franklin, D.; Jackson, C. W.; Hunt, P.; Saris, C. J. M.; Orkin, S. H. : Transcription factor NF-E2 is required for platelet formation independent of the actions of thrombopoietin/MGDF in megakaryocyte development. Cell 81: 695-704, 1995. ; and

[66609] Weremowicz, S.; Andrews, N. C.; Orkin, S. H.; Morton, C. C. : Mapping the p45 subunit of human NFE2 to 12q13. (Abstract) Human Genome Mapping Workshop 93 25, 1993.

[66610] Further studies establishing the function and utilities of

NFE2 are found in John Hopkins OMIM database record ID 601490, and in cited publications numbered 998 and 10585–1274 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Factor (erythroid–derived 2)–like 1 (NFE2L1, Accession NM\_003204) is another VGAM1958 host target gene. NFE2L1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NFE2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFE2L1 BINDING SITE, designated SEQ ID:9197, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66611] Another function of VGAM1958 is therefore inhibition of Nuclear Factor (erythroid–derived 2)–like 1 (NFE2L1, Accession NM\_003204), a gene which may regulate expression of ferritin genes. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2L1. The function of NFE2L1 and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM369.NKX3A (Accession NM\_006167) is another VGAM1958 host target gene. NKX3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NKX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX3A BINDING SITE, designated SEQ ID:12828, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66612] Another function of VGAM1958 is therefore inhibition of NKX3A (Accession NM\_006167), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX3A. The function of NKX3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481.Neuronal Pentraxin I (NPTX1, Accession NM\_002522) is another VGAM1958 host target gene. NPTX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by NPTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE, designated SEQ ID:8357, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66613] Another function of VGAM1958 is therefore inhibition of Neuronal Pentraxin I (NPTX1, Accession NM\_002522), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX1. The function of NPTX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111. Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM\_006186) is another VGAM1958 host target gene. NR4A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NR4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NR4A2 BINDING SITE, designated SEQ ID:12857, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66614] Another function of VGAM1958 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM\_006186), a gene which may be a general coactivator of transcription. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A2. The function of NR4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127.Nebulin-related Anchoring Protein (Nrap, Accession NM\_139235) is another VGAM1958 host target gene. Nrap BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Nrap, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nrap BINDING SITE, designated SEQ ID:29236, to the nucleotide sequence of VGAM1958 RNA,

herein designated VGAM RNA, also designated SEQ ID:4669.

[66615] Another function of VGAM1958 is therefore inhibition of Nebulin-related Anchoring Protein (Nrap, Accession NM\_139235), a gene which performs an anchoring function to link the terminal actin filaments of myofibrils to protein complexes located beneath the sarcolemma. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nrap. The function of Nrap and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM649. Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM\_006180) is another VGAM1958 host target gene. NTRK2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:12846, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ

ID:4669.

[66616] Another function of VGAM1958 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM\_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341. Nucleobindin 1 (NUCB1, Accession NM\_006184) is another VGAM1958 host target gene. NUCB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUCB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUCB1 BINDING SITE, designated SEQ ID:12852, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66617] Another function of VGAM1958 is therefore inhibition of Nucleobindin 1 (NUCB1, Accession NM\_006184), a gene

which may have a role in calcium homeostasis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUCB1. The function of NUCB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1523. Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM\_167853) is another VGAM1958 host target gene. NUMA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NUMA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUMA1 BINDING SITE, designated SEQ ID:44883, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66618] Another function of VGAM1958 is therefore inhibition of Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM\_167853), a gene which is nuclear mitotic apparatus protein. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMA1. The function of

NUMA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM192. Nucleoporin 98kDa (NUP98, Accession NM\_016320) is another VGAM1958 host target gene. NUP98 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUP98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP98 BINDING SITE, designated SEQ ID:18444, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66619] Another function of VGAM1958 is therefore inhibition of Nucleoporin 98kDa (NUP98, Accession NM\_016320), a gene which functions in the nuclear transport of protein and RNA. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP98. The function of NUP98 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM55.2'-5'-oligoadenylate Synthetase 2, 69/71kDa (OAS2, Accession NM\_002535) is another VGAM1958 host target gene. OAS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS2 BINDING SITE, designated SEQ ID:8374, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66620] Another function of VGAM1958 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 2, 69/71kDa (OAS2, Accession NM\_002535), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS2. The function of OAS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1498.O-linked N-acetylglucosamine (GlcNAc) Transferase

(UDP-N-acetylglucosamine:polypeptide-N-acetylglucosaminyl transferase) (OGT, Accession NM\_003605) is another VGAM1958 host target gene. OGT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGT BINDING SITE, designated SEQ ID:9662, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66621] Another function of VGAM1958 is therefore inhibition of O-linked N-acetylglucosamine (GlcNAc) Transferase (UDP-N-acetylglucosamine:polypeptide-N-acetylglucosaminyl transferase) (OGT, Accession NM\_003605), a gene which has a role in the glycosylation of nuclear and cytoplasmic proteins. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGT. The function of OGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464.Oligodendrocyte Lineage Transcription Factor 2

(OLIG2, Accession NM\_005806) is another VGAM1958 host target gene. OLIG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OLIG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLIG2 BINDING SITE, designated SEQ ID:12381, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66622] Another function of VGAM1958 is therefore inhibition of Oligodendrocyte Lineage Transcription Factor 2 (OLIG2, Accession NM\_005806), a gene which may bind DNA and contains a helix-loop-helix DNA-binding domain. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLIG2. The function of OLIG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1514. Oligophrenin 1 (OPHN1, Accession NM\_002547) is another VGAM1958 host target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:8401, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66623] Another function of VGAM1958 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM\_002547). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1. Otoferlin (OTOF, Accession NM\_004802) is another VGAM1958 host target gene. OTOF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OTOF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OTOF BINDING SITE, designated SEQ ID:11225, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66624] Another function of VGAM1958 is therefore inhibition of Otoferlin (OTOF, Accession NM\_004802), a gene which is

involved in vesicle membrane fusion and required for inner ear function. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTOF. The function of OTOF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM625. Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424) is another VGAM1958 host target gene. PACSIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACSIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN1 BINDING SITE, designated SEQ ID:44315, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66625] Another function of VGAM1958 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAC-

SIN1. Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM\_006452) is another VGAM1958 host target gene. PAICS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAICS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAICS BINDING SITE, designated SEQ ID:13163, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66626] Another function of VGAM1958 is therefore inhibition of Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM\_006452), a gene which is required for purine biosynthesis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAICS. The function of PAICS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894.PART1 (Accession NM\_016590) is another

VGAM1958 host target gene. PART1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PART1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PART1 BINDING SITE, designated SEQ ID:18666, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66627] Another function of VGAM1958 is therefore inhibition of PART1 (Accession NM\_016590). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PART1. Prostatic Binding Protein (PBP, Accession NM\_002567) is another VGAM1958 host target gene. PBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PBP BINDING SITE, designated SEQ ID:8415, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66628] Another function of VGAM1958 is therefore inhibition of Prostatic Binding Protein (PBP, Accession NM\_002567), a gene which regulates the activity of the Raf/MEK/ERK module. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBP. The function of PBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1332. Protocadherin Beta 16 (PCDHB16, Accession NM\_020957) is another VGAM1958 host target gene. PCDHB16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCDHB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB16 BINDING SITE, designated SEQ ID:21943, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66629] Another function of VGAM1958 is therefore inhibition of Protocadherin Beta 16 (PCDHB16, Accession NM\_020957), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1958 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB16. The function of PCDHB16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM931.6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 3 (PFKFB3, Accession XM\_096349) is another VGAM1958 host target gene. PFKFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFKFB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFKFB3 BINDING SITE, designated SEQ ID:40318, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66630] Another function of VGAM1958 is therefore inhibition of 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 3 (PFKFB3, Accession XM\_096349), a gene which catalyzes synthesis and degradation of fructose 2,6-bisphosphate. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFKFB3. The function of PFKFB3 has

been established by previous studies. The bifunctional 6-phosphofructo-2-kinase (EC 2.7.1.105)/fructose-2,6-bisphosphatase (EC 3.1.3.46) (PFKFB) regulates the steady-state concentration of fructose-2,6-bisphosphate, a potent activator of a key regulatory enzyme of glycolysis, phosphofructokinase. Cancer cells maintain a high glycolytic rate even in the presence of oxygen, a phenomenon known as the Warburg effect (Warburg, 1956). The glycolytic rate in the placenta, another fast-growing tissue, is accelerated by anoxia and by maternal diabetes. By screening a placental cDNA library with human and frog liver PFKFB (PFKFB1; 311790) as probes, Sakai et al. (1996) obtained a cDNA encoding PFKFB3, which they termed HP (human placental PFKFB). The predicted PFKFB3 protein, which is 61% similar to human liver PFKFB, contains 529 amino acids and 7 potential phosphorylation sites. Northern blot analysis of first-trimester and term placentas detected a 4.5-kb PFKFB3 transcript

[66631] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66632] Sakai, A.; Kato, M.; Fukasawa, M.; Ishiguro, M.; Furuya, E.;

Sakakibara, R. : Cloning of cDNA encoding for a novel isozyme of fructose 6-phosphate,2-kinase/fructose 2,6-bisphosphatase from human placenta. J. Biochem. 119: 506-511, 1996. ; and

[66633] Warburg, O. : On the origin of cancer cells. Science 123: 309-314, 1956.

[66634] Further studies establishing the function and utilities of PFKFB3 are found in John Hopkins OMIM database record ID 605319, and in cited publications numbered 4485-4488, 449 and 7350 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982) is another VGAM1958 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30605, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66635] Another function of VGAM1958 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3. Polycystic Kidney Disease 1 (autosomal dominant) (PKD1, Accession NM\_000296) is another VGAM1958 host target gene. PKD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PKD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKD1 BINDING SITE, designated SEQ ID:5841, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66636] Another function of VGAM1958 is therefore inhibition of Polycystic Kidney Disease 1 (autosomal dominant) (PKD1, Accession NM\_000296). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD1. Phospholipase A2, Group IID (PLA2G2D, Accession NM\_012400) is another VGAM1958 host target gene.

PLA2G2D BINDING SITE1 and PLA2G2D BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PLA2G2D, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G2D BINDING SITE1 and PLA2G2D BINDING SITE2, designated SEQ ID:14772 and SEQ ID:14769 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66637] Another function of VGAM1958 is therefore inhibition of Phospholipase A2, Group IID (PLA2G2D, Accession NM\_012400), a gene which is involved in phospholipid digestion, remodeling of cell membranes, and host defense, as well as pathophysiologic processes. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G2D. The function of PLA2G2D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Phospholipase C, Beta 2 (PLCB2, Accession NM\_004573) is another VGAM1958 host target gene. PLCB2 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by PLCB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLCB2 BINDING SITE, designated SEQ ID:10916, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66638] Another function of VGAM1958 is therefore inhibition of Phospholipase C, Beta 2 (PLCB2, Accession NM\_004573), a gene which is the beta 2 subunit of phospholipase C. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCB2. The function of PLCB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1188. Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM\_002709) is another VGAM1958 host target gene. PPP1CB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PPP1CB BINDING SITE, designated SEQ ID:8556, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66639] Another function of VGAM1958 is therefore inhibition of Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM\_002709), a gene which is the catalytic subunit of protein phosphatase 1. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1CB. The function of PPP1CB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46. Protein Phosphatase 2, Regulatory Subunit B (B56), Alpha Isoform (PPP2R5A, Accession NM\_006243) is another VGAM1958 host target gene. PPP2R5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5A BINDING SITE, designated SEQ

ID:12909, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66640] Another function of VGAM1958 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Alpha Isoform (PPP2R5A, Accession NM\_006243), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5A. The function of PPP2R5A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675. Palmitoyl-protein Thioesterase 1 (ceroid-lipofuscinosis, neuronal 1, infantile) (PPT1, Accession XM\_029842) is another VGAM1958 host target gene. PPT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPT1 BINDING SITE, designated SEQ ID:30956, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ

ID:4669.

[66641] Another function of VGAM1958 is therefore inhibition of Palmitoyl-protein Thioesterase 1 (ceroid-lipofuscinosis, neuronal 1, infantile) (PPT1, Accession XM\_029842). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT1. Protein Kinase C, Alpha Binding Protein (PRKCABP, Accession NM\_012407) is another VGAM1958 host target gene. PRKCABP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRKCABP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCABP BINDING SITE, designated SEQ ID:14787, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66642] Another function of VGAM1958 is therefore inhibition of Protein Kinase C, Alpha Binding Protein (PRKCABP, Accession NM\_012407), a gene which may interact with the catalytic domain of protein C kinase. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRK-

CABP. The function of PRKCABP has been established by previous studies. Staudinger et al. (1995) obtained a mouse cDNA encoding Prkcabp, which they called Pick1 (protein interacting with C kinase-1), using a yeast 2-hybrid screen with the catalytic domain of the alpha isoform of activated protein kinase C (PRKCA; 176960) as bait. Immunofluorescence microscopy demonstrated intense perinuclear and diffuse cytoplasmic staining. Using a yeast 2-hybrid screen of a B-cell cDNA library with p67-phox (NCF2; 233710) as bait, Takeya et al. (2000) obtained a cDNA encoding human PRKCABP, which they called PICK1. Sequence analysis predicted that the 415-amino acid protein, which is 92% identical to the mouse protein, contains an N-terminal PDZ domain and a conserved arfaptin homology (AH) domain (see OMIM Ref. No. 601638). Northern blot analysis revealed ubiquitous expression of a 2.0-kb PICK1 transcript. Genomic sequence analysis determined that the PICK1 gene contains 13 exons and spans at least 18 kb. Yeast 2-hybrid analysis indicated that the PDZ domain, but not the AH domain, of PICK1 interacts with the C termini of the GTP-bound forms of ADP-ribosylation factor-1 (ARF1; 103180) and ARF3 (OMIM Ref. No. 103190). The interaction with ARF5

(OMIM Ref. No. 103188) and ARF6 (OMIM Ref. No. 600464) was weak, suggesting that the PICK1 interaction is specific for class I ARFs and that it may regulate Golgi-to-endoplasmic reticulum vesicle transport. Dev et al. (1999) showed that the PDZ domain of rat Pick1 interacts with the last 10 amino acids of the short C-terminal alternative splice variants of AMPA receptor subunits (e.g., GLUR2; 138248). They proposed that E-S-V/I-K-I, a sequence found in these 10 amino acids, is a novel PDZ-binding motif. Dev et al. (1999) noted that PRKCA phosphorylates Pick1 efficiently but binds Pick1 in both the phosphorylated and unphosphorylated states. Xia et al. (1999) reported that Pick1 interacts with mouse AMPA glutamate receptors and noted their colocalization at excitatory synapses in the brain. Using a yeast 2-hybrid system, Cowan et al. (2000) demonstrated that mouse Pick1 binds the C-terminal tail of Ephb2 (OMIM Ref. No. 600997). Metabotropic glutamate receptor-7 (mGluR7; 604101) localizes specifically to presynaptic active zones. Boudin et al. (2000) showed that the extreme C-terminal 3 amino acids of mGluR7 interact with the PDZ domain of Pick1. Immunofluorescence microscopy demonstrated that both proteins are localized at excitatory synapses in hip-

pocampal neurons. The authors showed that the clustering of mGluR7 at synapses requires its C-terminal PDZ-binding residues. Mutant mGluR7 lacking the PDZ-binding residues localized diffusely along axons rather than at the synapse, suggesting a role for Pick1 as a scaffolding molecule at presynaptic sites. By its inclusion within a mapped clone, Takeya et al. (2000) mapped the PRKCABP gene to 22q12.3–q13.2.

[66643] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66644] Boudin, H.; Doan, A.; Xia, J.; Shigemoto, R.; Huganir, R. L.; Worley, P.; Craig, A. M. : Presynaptic clustering of mGluR7a requires the PICK1 PDZ domain binding site. Neuron 28: 485–497, 2000. ; and

[66645] Cowan, C. A.; Yokoyama, N.; Bianchi, L. M.; Henkemeyer, M.; Fritzsche, B. : EphB2 guides axons at the midline and is necessary for normal vestibular function. Neuron 26: 417–430, 2000.

[66646] Further studies establishing the function and utilities of PRKCABP are found in John Hopkins OMIM database record ID 605926, and in cited publications numbered 644 and 12328–6444 listed in the bibliography section

hereinbelow, which are also hereby incorporated by reference. Prostaglandin F Receptor (FP) (PTGFR, Accession NM\_000959) is another VGAM1958 host target gene. PTGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFR BINDING SITE, designated SEQ ID:6664, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66647] Another function of VGAM1958 is therefore inhibition of Prostaglandin F Receptor (FP) (PTGFR, Accession NM\_000959), a gene which mediates intracellular calcium flux, strongly similar to murine *Ptgfr*. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFR. The function of PTGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1781. Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM\_000962) is another VGAM1958

host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:6674 and SEQ ID:27895 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66648] Another function of VGAM1958 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM\_000962), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. Protein Tyrosine Phosphatase, Non-receptor Type 11 (Noonan syndrome 1) (PTPN11, Ac-

cession NM\_002834) is another VGAM1958 host target gene. PTPN11 BINDING SITE1 and PTPN11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPN11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN11 BINDING SITE1 and PTPN11 BINDING SITE2, designated SEQ ID:8712 and SEQ ID:10539 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66649] Another function of VGAM1958 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 11 (Noonan syndrome 1) (PTPN11, Accession NM\_002834). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN11. Phosphorylase, Glycogen; Brain (PYGB, Accession NM\_002862) is another VGAM1958 host target gene. PYGB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of PYGB BINDING SITE, designated SEQ ID:8764, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66650] Another function of VGAM1958 is therefore inhibition of Phosphorylase, Glycogen; Brain (PYGB, Accession NM\_002862). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGB. PYGO2 (Accession XM\_034083) is another VGAM1958 host target gene. PYGO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYGO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGO2 BINDING SITE, designated SEQ ID:32000, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66651] Another function of VGAM1958 is therefore inhibition of PYGO2 (Accession XM\_034083). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGO2.

RAB, Member of RAS Oncogene Family-like 2A (RABL2A, Accession NM\_013412) is another VGAM1958 host target gene. RABL2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RABL2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABL2A BINDING SITE, designated SEQ ID:15077, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66652] Another function of VGAM1958 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 2A (RABL2A, Accession NM\_013412). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL2A. RAB, Member of RAS Oncogene Family-like 2B (RABL2B, Accession NM\_007081) is another VGAM1958 host target gene. RABL2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RABL2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of RABL2B BINDING SITE, designated SEQ ID:13944, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66653] Another function of VGAM1958 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 2B (RABL2B, Accession NM\_007081). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL2B. RAD1 Homolog (*S. pombe*) (RAD1, Accession NM\_133377) is another VGAM1958 host target gene. RAD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD1 BINDING SITE, designated SEQ ID:28499, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66654] Another function of VGAM1958 is therefore inhibition of RAD1 Homolog (*S. pombe*) (RAD1, Accession NM\_133377), a gene which has important roles in DNA damage-activated mitotic and meiotic cell cycle check-

points. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD1. The function of RAD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM922.RAD54-like (*S. cerevisiae*) (RAD54L, Accession NM\_003579) is another VGAM1958 host target gene. RAD54L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAD54L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD54L BINDING SITE, designated SEQ ID:9629, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66655] Another function of VGAM1958 is therefore inhibition of RAD54-like (*S. cerevisiae*) (RAD54L, Accession NM\_003579), a gene which is involved in dna repair and mitotic recombination. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD54L. The func-

tion of RAD54L has been established by previous studies. Repair of double-stranded DNA breaks is essential for homologous recombination in somatic cells to protect DNA from damage by ionizing radiation and other genotoxins. The rad52 pathway is required for homologous recombination in the yeast *S. cerevisiae*. Kanaar et al. (1996) searched for mammalian homologs of yeast rad54, an essential component of this pathway and a member of the rad52 group. Using RT-PCR with degenerate primers, Kanaar et al. (1996) identified the mouse and human homologs of *S. cerevisiae* rad54. The human homolog, HR54, is 48% identical to the yeast protein and belongs to the SNF2/SWI2 family, which is characterized by amino acid motifs found in DNA-dependent ATPases. Proteins in the SNF2/SWI2 family are involved in many aspects of DNA metabolism, including transcription, repair, and recombination. HR54 protein is located in the nucleus, consistent with its nuclear localization signal and a potential function in DNA metabolism. Expression of HR54 increased approximately 3-fold in late G1 phase; this pattern is similar to that in yeast. HR54 was able to partially complement the DNA repair defect of *S. cerevisiae* rad54-deleted cells. By Northern blot analysis, Kanaar et al. (1996) showed

that expression of the mouse homolog of HR54 is increased in organs of lymphoid and germ cell development. Mouse expression was 3-fold higher in spermatocytes than in spermatids, suggesting that HR54 plays a role in meiotic recombination. Kanaar et al. (1996) mapped the HR54 gene to chromosome 1p32 using fluorescence in situ hybridization. Association of the recombinational repair protein RAD51 (OMIM Ref. No. 179617) with tumor suppressors BRCA1 (OMIM Ref. No. 113705) and BRCA2 (OMIM Ref. No. 600185) suggested that defects in homologous recombination are responsible for tumor formation. This idea was supported by the fact that the protein associated with the MRE11/RAD50 repair complex (NBS1; 602667) is mutated in Nijmegen breakage syndrome (OMIM Ref. No. 251260), which is characterized by increased cancer incidence and sensitivity to ionizing radiation. Since RAD51 forms a complex with other members of the RAD52 (OMIM Ref. No. 600392) epistasis group and with BRCA proteins, it was reasonable to ask if alterations of members of the RAD52 epistasis group lead to tumor development. Matsuda et al. (1999) described missense mutations at functional regions of RAD54 and the absence of the wildtype RAD54 expression resulting

from aberrant splicing in primary cancers. Since RAD54 is a recombination protein associated with RAD51, this was the first genetic evidence that cancer can arise from a defect in repair processes involving homologous recombination. They observed a pro63-to-his mutation (603615.0001) of the RAD54 gene in an adenocarcinoma of the colon and a val444-to-glu mutation (603615.0002) in a non-Hodgkin lymphoma. Although pro at codon 63 and val at codon 444 are outside helicase motifs, Matsuda et al. (1999) considered it likely that these amino acid substitutions affect the function of RAD54. The mutations demonstrated by Matsuda et al. (1999) were rare among the tumors studied: 95 breast cancers, 13 colorectal cancers, and 24 lymphomas.

[66656] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66657] Kanaar, R.; Troelstra, C.; Swagemakers, S. M. A.; Essers, J.; Smit, B.; Franssen, J.-H.; Pastink, A.; Bezzubova, O. Y.; Buerstedde, J.-M.; Clever, B.; Heyer, W.-D.; Hoeijmakers, J. H. J. : Human and mouse homologs of the *Saccharomyces cerevisiae* RAD54 DNA repair gene: evidence for functional conservation. *Curr. Biol.* 6: 828–838, 1996. ; and

[66658] Matsuda, M.; Miyagawa, K.; Takahashi, M.; Fukuda, T.; Kataoka, T.; Asahara, T.; Inui, H.; Watatani, M.; Yasutomi, M.; Kamada, N.; Dohi, K.; Kamiya, K. : Mutations in the RAD54 recombina.

[66659] Further studies establishing the function and utilities of RAD54L are found in John Hopkins OMIM database record ID 603615, and in cited publications numbered 7589–7590 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinoic Acid Induced 3 (RAI3, Accession NM\_003979) is another VGAM1958 host target gene. RAI3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI3 BINDING SITE, designated SEQ ID:10115, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66660] Another function of VGAM1958 is therefore inhibition of Retinoic Acid Induced 3 (RAI3, Accession NM\_003979). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with RAI3. RalA Binding Protein 1 (RALBP1, Accession NM\_006788) is another VGAM1958 host target gene. RALBP1 BINDING SITE1 and RALBP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RALBP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE1 and RALBP1 BINDING SITE2, designated SEQ ID:13660 and SEQ ID:13662 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66661] Another function of VGAM1958 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM\_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xenobiotics. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345.RecQ Protein-like 5 (RECQL5, Accession

NM\_004259) is another VGAM1958 host target gene. RECQL5 BINDING SITE1 and RECQL5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RECQL5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RECQL5 BINDING SITE1 and RECQL5 BINDING SITE2, designated SEQ ID:10449 and SEQ ID:10448 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66662] Another function of VGAM1958 is therefore inhibition of RecQ Protein-like 5 (RECQL5, Accession NM\_004259). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECQL5. Arginine-glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102) is another VGAM1958 host target gene. RERE BINDING SITE1 and RERE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RERE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

RERE BINDING SITE1 and RERE BINDING SITE2, designated SEQ ID:14408 and SEQ ID:13261 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66663] Another function of VGAM1958 is therefore inhibition of Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102), a gene which binds DRPLA and locates in the nucleus. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERE. The function of RERE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Ribulose–5–phosphate–3–epimerase (RPE, Accession XM\_030834) is another VGAM1958 host target gene. RPE BINDING SITE1 and RPE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RPE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPE BINDING SITE1 and RPE BINDING SITE2, designated SEQ ID:31156 and SEQ ID:31154 respectively, to the nucleotide sequence of

VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66664] Another function of VGAM1958 is therefore inhibition of Ribulose-5-phosphate-3-epimerase (RPE, Accession XM\_030834). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPE. Sal-like 2 (Drosophila) (SALL2, Accession XM\_033473) is another VGAM1958 host target gene. SALL2 BINDING SITE1 and SALL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SALL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL2 BINDING SITE1 and SALL2 BINDING SITE2, designated SEQ ID:31935 and SEQ ID:31936 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66665] Another function of VGAM1958 is therefore inhibition of Sal-like 2 (Drosophila) (SALL2, Accession XM\_033473). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL2. Succinate Dehydrogenase

Complex, Subunit C, Integral Membrane Protein, 15kDa (SDHC, Accession XM\_045183) is another VGAM1958 host target gene. SDHC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDHC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDHC BINDING SITE, designated SEQ ID:34381, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66666] Another function of VGAM1958 is therefore inhibition of Succinate Dehydrogenase Complex, Subunit C, Integral Membrane Protein, 15kDa (SDHC, Accession XM\_045183). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDHC. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 13 (SERPINB13, Accession NM\_012397) is another VGAM1958 host target gene. SERPINB13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SERPINB13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB13 BINDING SITE, designated SEQ ID:14761, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66667] Another function of VGAM1958 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 13 (SERPINB13, Accession NM\_012397), a gene which plays a role in the proliferation or differentiation of keratinocytes. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB13. The function of SERPINB13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924. Soc-2 Suppressor of Clear Homolog (C. elegans) (SHOC2, Accession NM\_007373) is another VGAM1958 host target gene. SHOC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SHOC2 BINDING SITE, designated SEQ ID:14303, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66668] Another function of VGAM1958 is therefore inhibition of Soc-2 Suppressor of Clear Homolog (*C. elegans*) (SHOC2, Accession NM\_007373), a gene which may be a regulator of the let-60 ras pathway. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOC2. The function of SHOC2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464. Short Stature Homeobox (SHOX, Accession NM\_000451) is another VGAM1958 host target gene. SHOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE, designated SEQ ID:6055, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66669] Another function of VGAM1958 is therefore inhibition of

Short Stature Homeobox (SHOX, Accession NM\_000451). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOX. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM\_005068) is another VGAM1958 host target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:11511, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66670] Another function of VGAM1958 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM\_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM665.Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM\_006517) is another VGAM1958 host target gene. SLC16A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC16A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A2 BINDING SITE, designated SEQ ID:13270, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66671] Another function of VGAM1958 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM\_006517). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A2. Solute Carrier Family 18 (vesicular monoamine), Member 1 (SLC18A1, Accession NM\_003053) is another VGAM1958 host target gene. SLC18A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC18A1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC18A1 BINDING SITE, designated SEQ ID:9015, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66672] Another function of VGAM1958 is therefore inhibition of Solute Carrier Family 18 (vesicular monoamine), Member 1 (SLC18A1, Accession NM\_003053), a gene which is involved in the vesicular transport of biogenic amines. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC18A1. The function of SLC18A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18. Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038) is another VGAM1958 host target gene. SLC1A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:8995, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66673] Another function of VGAM1958 is therefore inhibition of Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038), a gene which transports alanine, serine, cysteine, and threonine. exhibits sodium dependence. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A4. The function of SLC1A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM859. Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM\_005628) is another VGAM1958 host target gene. SLC1A5 BINDING SITE1 and SLC1A5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC1A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A5

BINDING SITE1 and SLC1A5 BINDING SITE2, designated SEQ ID:12143 and SEQ ID:38403 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66674] Another function of VGAM1958 is therefore inhibition of Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM\_005628). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A5. Solute Carrier Family 25 (mitochondrial carrier, brain), Member 14 (SLC25A14, Accession NM\_022810) is another VGAM1958 host target gene. SLC25A14 BINDING SITE1 and SLC25A14 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC25A14, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A14 BINDING SITE1 and SLC25A14 BINDING SITE2, designated SEQ ID:23086 and SEQ ID:10087 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66675] Another function of VGAM1958 is therefore inhibition of

Solute Carrier Family 25 (mitochondrial carrier, brain), Member 14 (SLC25A14, Accession NM\_022810), a gene which participates in the mitochondrial proton leak measured in brain mitochondria. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A14. The function of SLC25A14 has been established by previous studies. Uncoupling proteins (UCPs) are proton channel carrier proteins not coupled to oxidative phosphorylation. They are located in the inner membrane of mitochondria and have been linked to the generation of heat. UCP1 (OMIM Ref. No. 113730) is localized to brown adipose tissue, UCP2 (OMIM Ref. No. 601693) is widely expressed, and UCP3 (OMIM Ref. No. 602044) is largely found in skeletal muscle. By searching an EST database for UCPs and screening a brain cDNA library, Sanchis et al. (1998) obtained a cDNA encoding SLC25A14, which they called 'brain mitochondrial carrier protein-1,' or BMCP1. The deduced 325-amino acid SLC25A14 protein contains 6 transmembrane domains, 3 motifs characteristic of mitochondrial energy transfer proteins, and 20 amino acids at the N terminus that are absent in UCP1, UCP2, and UCP3. SLC25A14 shares 34, 38, and 39% amino acid iden-

tity with UCP1, UCP2, and UCP3, respectively. Northern blot analysis detected high expression of a 1.8-kb SLC25A14 transcript in brain. RNA dot-blot analysis detected SLC25A14 expression in testis and pituitary. In situ hybridization analysis in mouse brain showed Slc25a14 expression in hypothalamus, cortex, hippocampus, thalamus, and amygdala. Functional analysis in yeast showed that SLC25A14 expression correlates with impaired growth rate and a marked uncoupling of respiration, suggesting that SLC25A14 may be a member of the UCP family Sanchis et al. (1998) identified an STS (GenBank G23624) mapping to Xq24 within the SLC25A14 gene. By analysis of a backcross panel, they mapped the mouse Slc25a14 gene to the X chromosome as well

[66676] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66677] Sanchis, D.; Fleury, C.; Chomiki, N.; Goubern, M.; Huang, Q.; Neverova, M.; Gregoire, F.; Easlick, J.; Raimbault, S.; Levi-Meyrueis, C.; Miroux, B.; Collins, S.; Seldin, M.; Richard, D.; Warden, C.; Bouillaud, F.; Ricquier, D. : BMCP1, a novel mitochondrial carrier with high expression in the central nervous system of humans and rodents, and

respiration uncoupling activity in recombinant yeast. J.

Biol. Chem. 273: 34611–34615, 1998. ; and

[66679] Further studies establishing the function and utilities of SLC25A14 are found in John Hopkins OMIM database record ID 300242, and in cited publications numbered 9160 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 29 (nucleoside transporters), Member 1 (SLC29A1, Accession NM\_004955) is another VGAM1958 host target gene. SLC29A1 BINDING SITE1 and SLC29A1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC29A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC29A1 BINDING SITE1 and SLC29A1 BINDING SITE2, designated SEQ ID:11400 and SEQ ID:19976 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66680] Another function of VGAM1958 is therefore inhibition of Solute Carrier Family 29 (nucleoside transporters), Member 1 (SLC29A1, Accession NM\_004955), a gene which mediates both influx and efflux of nucleosides across the membrane. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC29A1. The function of SLC29A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1908. Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 6 (SLC7A6, Accession NM\_003983) is another VGAM1958 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10123, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66681] Another function of VGAM1958 is therefore inhibition of

Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 6 (SLC7A6, Accession NM\_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 5 (SMARCA5, Accession NM\_003601) is another VGAM1958 host target gene. SMARCA5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SMARCA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCA5 BINDING SITE, designated SEQ ID:9655, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66682] Another function of VGAM1958 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent

## Regulator of Chromatin, Subfamily A, Member 5

(SMARCA5, Accession NM\_003601), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCA5. The function of SMARCA5 has been established by previous studies. Poot et al. (2000) identified SMARCA5, which they called SNF2H, within a chromatin remodeling complex, CHRAC, purified from HeLa cell nuclear extracts. They confirmed an interaction between SMARCA5 and ACF1 (BAZ1A). Two small histone-fold proteins, CHRAC17 (POLE3; 607267) and CHRAC15 (CHRAC1; 607268), copurified with the complex, and the authors showed that these proteins form a DNA-binding heterodimer. Poot et al. (2000) determined that the purified complex could mobilize nucleosomes into a regularly spaced nucleosomal array and that the spacing activity was strictly ATP-dependent. By Western blot analysis of protein expression levels in several human and mammalian cell lines, Bozhenok et al. (2002) determined that SMARCA5 interacts with BAZ1B (OMIM Ref. No. 605681). In vitro analysis of the mouse Smarca5-Baz1b complex showed that, in the presence of ATP, the complex can cre-

ate regular nucleosomal arrays from irregular chromatin

[66683] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66684] Bozhenok, L.; Wade, P. A.; Varga-Weisz, P. : WSTF-ISWI chromatin remodeling complex targets heterochromatic replication foci. EMBO J. 21: 2231–2241, 2002. ; and

[66685] Poot, R. A.; Dellaire, G.; Hulsmann, B. B.; Grimaldi, M. A.; Corona, D. F. V.; Becker, P. B.; Bickmore, W. A.; Varga-Weisz, P. D. : HuCHRAAC, a human ISWI chromatin remodeling complex cont.

[66686] Further studies establishing the function and utilities of SMARCA5 are found in John Hopkins OMIM database record ID 603375, and in cited publications numbered 5070–507 and 7226–5074 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_003076) is another VGAM1958 host target gene. SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCD1, corresponding to HOST TARGET binding sites such as BIND–

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2, designated SEQ ID:9043 and SEQ ID:29141 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66687] Another function of VGAM1958 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_003076), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1. The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.SNL (Accession NM\_003088) is another VGAM1958 host target gene. SNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SNL BINDING SITE, designated SEQ ID:9065, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66688] Another function of VGAM1958 is therefore inhibition of SNL (Accession NM\_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675.Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696) is another VGAM1958 host target gene. SPOCK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPOCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPOCK BINDING SITE, designated SEQ ID:31458, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ

ID:4669.

[66689] Another function of VGAM1958 is therefore inhibition of Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPOCK. Sequestosome 1 (SQSTM1, Accession NM\_003900) is another VGAM1958 host target gene. SQSTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SQSTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SQSTM1 BINDING SITE, designated SEQ ID:9990, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66690] Another function of VGAM1958 is therefore inhibition of Sequestosome 1 (SQSTM1, Accession NM\_003900), a gene which binds SH2 domain of p56lck and ubiquitin, and it is associated with a serine/threonine kinase activity. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with SQSTM1. The function of SQSTM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM824.V-src Sarcoma (Schmidt-Ruppin A-2) Viral Oncogene Homolog (avian) (SRC, Accession NM\_005417) is another VGAM1958 host target gene. SRC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRC BINDING SITE, designated SEQ ID:11888, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66691] Another function of VGAM1958 is therefore inhibition of V-src Sarcoma (Schmidt-Ruppin A-2) Viral Oncogene Homolog (avian) (SRC, Accession NM\_005417), a gene which is a tyrosine kinase. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRC. The function of SRC and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM721. Signal Transducer and Activator of Transcription 6, Interleukin-4 Induced (STAT6, Accession NM\_003153) is another VGAM1958 host target gene. STAT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT6 BINDING SITE, designated SEQ ID:9131, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66692] Another function of VGAM1958 is therefore inhibition of Signal Transducer and Activator of Transcription 6, Interleukin-4 Induced (STAT6, Accession NM\_003153), a gene which carries out a dual function: signal transduction and activation of transcription. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT6. The function of STAT6 has been established by previous studies. By searching a database of expressed sequence tags (ESTs), Quelle et al. (1995) identified a number of expressed genes in the signal transducers and activators of

a transcription (STAT) family. Human and murine full-length cDNA clones were obtained and sequenced. The sequence of the human cDNA was identical to the sequence published by Hou et al. (1994) for the interleukin-4-induced transcription factor (called by them IL4 Stat), while the murine STAT6 amino acid and nucleotide sequences reported by Quelle et al. (1995) were 83% and 84% identical to the human sequences, respectively. Using STAT6-specific antiserum, Quelle et al. (1995) demonstrated that STAT6 is rapidly tyrosine phosphorylated following stimulation of appropriate cell lines with IL4 (OMIM Ref. No. 147780) or IL3 (OMIM Ref. No. 147740), but is not detectably phosphorylated following stimulation with IL2 (OMIM Ref. No. 147680), IL12 (OMIM Ref. No. 161560), or erythropoietin (OMIM Ref. No. 133170). In contrast, IL2, IL3, and erythropoietin induced the tyrosine phosphorylation of STAT5 (OMIM Ref. No. 601511), while IL12 uniquely induced the tyrosine phosphorylation of STAT4 (OMIM Ref. No. 600558). Inducible tyrosine phosphorylation of STAT6 required the membrane-distal region of the IL4 receptor alpha chain (OMIM Ref. No. 147781). They found that this region of the receptor is not required for cell growth, demonstrating that STAT6

tyrosine phosphorylation does not contribute to mitogenesis. Ghilardi et al. (1996) demonstrated that along with STAT3 (OMIM Ref. No. 102582) and STAT5, STAT6 is involved in signaling from the leptin receptor (OMIM Ref. No. 601007) and that this signaling is defective in the db/db mouse which carries a point mutation within the leptin receptor gene. Darnell (1996) reflected on STAT3, STAT5, and STAT6 as 'fat STATs,' i.e., the involvement of these 3 STATs, but not STAT1, STAT2, and STAT4, in the physiologic action of leptin (OMIM Ref. No. 164160) as described by Ghilardi et al. (1996).

[66693] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66694] Ghilardi, N.; Ziegler, S.; Wiestner, A.; Stoffel, R.; Heim, M. H.; Skoda, R. C. : Defective STAT signaling by the leptin receptor in diabetic mice. Proc. Nat. Acad. Sci. 93: 6231–6235, 1996. ; and

[66695] Quelle, F. W.; Shimoda, K.; Thierfelder, W.; Fischer, C.; Kim, A.; Ruben, S. M.; Cleveland, J. L.; Pierce, J. H.; Keegan, A. D.; Nelms, K.; Paul, W. E.; Ihle, J. N. : Cloning of murin.

[66696] Further studies establishing the function and utilities of

STAT6 are found in John Hopkins OMIM database record ID 601512, and in cited publications numbered 8096, 9451, 11335, 9452, 11336, 2772–277 and 10044 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine/threonine Kinase 10 (STK10, Accession NM\_005990) is another VGAM1958 host target gene. STK10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK10 BINDING SITE, designated SEQ ID:12613, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66697] Another function of VGAM1958 is therefore inhibition of Serine/threonine Kinase 10 (STK10, Accession NM\_005990), a gene which can act on substrates such as myelin basic protein and histone iia on serine and threonine residues. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK10. The function of STK10 has been established by previous studies. Ku-

ramochi et al. (1997) cloned the mouse gene *Stk10*, coding for a new serine/threonine kinase, designated LOK. Kuramochi et al. (1999) described the cloning of a cDNA encoding the human homolog and the detection of LOK proteins in human lymphoid cells. They deposited the sequence of a human LOK cDNA in GenBank (AB015718). They also determined the chromosomal location of the gene by fluorescence in situ hybridization: 5q35.1 in human, 11A4 in mouse, and 10q12.3 in rat. By means of polymorphic CA repeats found in the 3-prime untranslated region of the mouse *Stk10* gene and an intersubspecific backcross mapping panel, they mapped the *Stk10* locus to a restricted region on chromosome 11 between D11Mit53 and D11Mit84. These results established STK10 as a new marker of human chromosome 5 to define the syntenic boundary of human chromosomes 5 and 16 on mouse chromosome 11.

[66698] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66699] Kuramochi, S.; Matsuda, Y.; Okamoto, M.; Kitamura, F.; Yonekawa, H.; Karasuyama, H. : Molecular cloning of the human gene STK10 encoding lymphocyte-oriented kinase,

and comparative chromosomal mapping of the human, mouse, and rat homologues. Immunogenetics 49: 369–375, 1999. ; and

[66700] Kuramochi, S.; Moriguchi, T.; Kuida, K.; Endo, J.; Semba, K.; Nishida, E.; Karasuyama, H. : LOK is a novel mouse STE20–like protein kinase that is expressed predominantly in lymphocyte.

[66701] Further studies establishing the function and utilities of STK10 are found in John Hopkins OMIM database record ID 603919, and in cited publications numbered 1005–1006 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine/threonine Kinase 11 (Peutz–Jeghers syndrome) (STK11, Accession NM\_000455) is another VGAM1958 host target gene. STK11 BINDING SITE1 and STK11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STK11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK11 BINDING SITE1 and STK11 BINDING SITE2, designated SEQ ID:6069 and SEQ ID:6070 respectively, to the nucleotide sequence of VGAM1958 RNA,

herein designated VGAM RNA, also designated SEQ ID:4669.

[66702] Another function of VGAM1958 is therefore inhibition of Serine/threonine Kinase 11 (Peutz–Jeghers syndrome) (STK11, Accession NM\_000455). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK11. Surfeit 4 (SURF4, Accession NM\_033161) is another VGAM1958 host target gene. SURF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SURF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF4 BINDING SITE, designated SEQ ID:27012, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66703] Another function of VGAM1958 is therefore inhibition of Surfeit 4 (SURF4, Accession NM\_033161), a gene which is a conserved integral membrane protein containing multiple putative transmembrane regions. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

SURF4. The function of SURF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM496.SWAP70 (Accession XM\_049197) is another VGAM1958 host target gene. SWAP70 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SWAP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SWAP70 BINDING SITE, designated SEQ ID:35347, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66704] Another function of VGAM1958 is therefore inhibition of SWAP70 (Accession XM\_049197), a gene which is involved not only in nuclear events but also in signaling in B-cell activation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP70. The function of SWAP70 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1090.Synaptogyrin 1 (SYNGR1, Accession

NM\_004711) is another VGAM1958 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:11066, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66705] Another function of VGAM1958 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM\_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Synaptogyrin 3 (SYNGR3, Accession NM\_004209) is another VGAM1958 host target gene. SYNGR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SYNGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR3 BINDING SITE, designated SEQ ID:10405, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66706] Another function of VGAM1958 is therefore inhibition of Synaptogyrin 3 (SYNGR3, Accession NM\_004209). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR3. TATA Box Binding Protein (TBP)-associated Factor, RNA Polymerase I, C, 110kDa (TAF1C, Accession NM\_005679) is another VGAM1958 host target gene. TAF1C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TAF1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF1C BINDING SITE, designated SEQ ID:12236, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66707] Another function of VGAM1958 is therefore inhibition of TATA Box Binding Protein (TBP)–associated Factor, RNA Polymerase I, C, 110kDa (TAF1C, Accession NM\_005679), a gene which belongs to component of the RNA polymerase I and II SL1 transcription factor. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF1C. The function of TAF1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM\_003189) is another VGAM1958 host target gene. TAL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAL1 BINDING SITE, designated SEQ ID:9175, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66708] Another function of VGAM1958 is therefore inhibition of T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession

NM\_003189), a gene which may help control cell growth and differentiation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAL1. The function of TAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM\_000116) is another VGAM1958 host target gene. TAZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAZ BINDING SITE, designated SEQ ID:5586, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66709] Another function of VGAM1958 is therefore inhibition of Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM\_000116). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TAZ. Transducin (beta)-like 1X-linked (TBL1X, Accession NM\_005647) is another VGAM1958 host target gene. TBL1X BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBL1X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:12187, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66710] Another function of VGAM1958 is therefore inhibition of Transducin (beta)-like 1X-linked (TBL1X, Accession NM\_005647), a gene which activates latent HDAC3 activity. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X. The function of TBL1X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151. Transducin (beta)-like 2 (TBL2, Accession NM\_032988) is another VGAM1958 host target gene. TBL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by TBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL2 BINDING SITE, designated SEQ ID:26868, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66711] Another function of VGAM1958 is therefore inhibition of Transducin (beta)-like 2 (TBL2, Accession NM\_032988), a gene which is of unknown function. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL2. The function of TBL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. TATA Box Binding Protein (TBP, Accession XM\_035700) is another VGAM1958 host target gene. TBP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBP BINDING SITE, designated SEQ ID:32330, to the nu-

cleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66712] Another function of VGAM1958 is therefore inhibition of TATA Box Binding Protein (TBP, Accession XM\_035700), a gene which plays a central role in the initiation of eukaryotic mRNA synthesis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBP. The function of TBP has been established by previous studies. The TBP C-terminal domain of 180 amino acids is well conserved, and this domain is both necessary and sufficient for interaction with DNA and for assembly of the basal transcription apparatus (Peterson et al., 1990). Contrary to the previously hypothesized existence of a family of genes coding for DNA-binding proteins highly related to TBP, Purrello et al. (1994) showed that the segment coding for the evolutionarily conserved C-terminal DNA-binding domain is unique. When bound to the TATA box, it has a saddle-like shape, with the concave face contacting DNA and the convex interacting with the other subunits of TFIID, which are called TBP-associated factors (TAFs; OMIM Ref. No. 600475), with TFIIA (600519, 600520) and TFIIB (OMIM Ref. No. 189963), with the A form of RNA

polymerase II CTD, and with positive and negative modulators of basal and activated transcription of class II genes (reviewed by Nikolov et al., 1992). The N terminus of TBP modulates the DNA-binding activity of the C terminus of the protein. It contains a long string of glutamine codons, which represents a common motif among other proteins involved in transcription, such as SP1 (OMIM Ref. No. 189906) and some homeo box proteins (Purrello et al., 1994). Animal model experiments lend further support to the function of TBP. Veenstra et al. (2000) tested the role of Tbp during the onset of embryonic transcription in *Xenopus* by antisense oligonucleotide-mediated turnover of maternal Tbp mRNA. Embryos without detectable Tbp initiated gastrulation but died before completing gastrulation. The expression of many genes transcribed by RNA polymerase II and III was reduced; however, some genes were transcribed with an efficiency identical to that of Tbp-containing embryos. Using a similar antisense strategy, Veenstra et al. (2000) found that the TBP-like factor Tlf/Trf2 (TBPL1; 605521) was essential for development past the midblastula stage. Because TBP and a TLF factor were found to play complementary roles in embryonic development, Veenstra et al. (2000) concluded that their re-

sults indicate that although similar mechanistic roles exist in common, TBP and TLF function differentially to control transcription of specific genes.

[66713] It is appreciated that the abovementioned animal model for TBP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[66714] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66715] Purrello, M.; Pietro, C. D.; Mirabile, E.; Rapisarda, A.; Rimini, R.; Tine, A.; Pavone, L.; Motta, S.; Grzeschik, K.-H.; Sichel, G. : Physical mapping at 6q27 of the locus for the TATA box-binding protein, the DNA-binding subunit of TFIID and a component of SL1 and TFIIB, strongly suggests that it is single copy in the human genome. *Genomics* 22: 94–100, 1994. ; and

[66716] Veenstra, G. J. C.; Weeks, D. L.; Wolffe, A. P. : Distinct roles for TBP and TBP-like factor in early embryonic gene transcription in *Xenopus*. *Science* 290: 2312–2314, 2000.

[66717] Further studies establishing the function and utilities of TBP are found in John Hopkins OMIM database record ID 600075, and in cited publications numbered 7663–7672,

7678–7675, 788 and 7895–7896 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tec Protein Tyrosine Kinase (TEC, Accession NM\_003215) is another VGAM1958 host target gene. TEC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEC BINDING SITE, designated SEQ ID:9217, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66718] Another function of VGAM1958 is therefore inhibition of Tec Protein Tyrosine Kinase (TEC, Accession NM\_003215). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEC. Testis Derived Transcript (3 LIM domains) (TES, Accession XM\_050430) is another VGAM1958 host target gene. TES BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of TES BINDING SITE, designated SEQ ID:35630, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66719] Another function of VGAM1958 is therefore inhibition of Testis Derived Transcript (3 LIM domains) (TES, Accession XM\_050430), a gene which acts as a tumor suppressor. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TES. The function of TES and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM363. Testis-specific Kinase 1 (TESK1, Accession NM\_006285) is another VGAM1958 host target gene. TESK1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TESK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TESK1 BINDING SITE, designated SEQ ID:12971, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66720] Another function of VGAM1958 is therefore inhibition of Testis-specific Kinase 1 (TESK1, Accession NM\_006285), a gene which plays a central role at, and after the meiotic phase of spermatogenesis. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSK1. The function of TSK1 has been established by previous studies. Toshima et al. (1995) isolated cDNA clones encoding the rat and human forms of testis-specific protein kinase-1 (TESK1). The deduced 626-amino acid human protein shares 92% sequence identity with its rat counterpart. The protein kinase domain is structurally similar to those of LIMK1 (OMIM Ref. No. 601329) and LIMK2 (OMIM Ref. No. 601988), with 49 to 50% sequence identity. Studying transgenic mice carrying a lacZ reporter plasmid for TSK1 expression, Toshima et al. (2001) found TSK1 in testicular germ cells only in postpubertal mice at the pachytene spermatocyte to sperm stage of maturation. No staining was detected in nongerminal cells or in germ cells at other stages. Expression was also found in adult renal proximal convoluted tubules, in cardiac myocytes, in pulmonary smooth muscle cells around bronchioles, and within neurons of several areas of the adult brain. Intense

staining was also found in brain, spinal cord, and olfactory region of day 12.5 embryonic mice.

[66721] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66722] Toshima, J.; Ohashi, K.; Okano, I.; Nunoue, K.; Kishioka, M.; Kuma, K.; Miyata, T.; Hirai, M.; Baba, T.; Mizuno, K. : Identification and characterization of a novel protein kinase, TESK1, specifically expressed in testicular germ cells. *J. Biol. Chem.* 270: 31331–31337, 1995. ; and

[66723] Toshima, J.; Toshima, J. Y.; Suzuki, M.; Noda, T.; Mizuno, K. : Cell-type-specific expression of a TESK1 promoter-linked lacZ gene in transgenic mice. *Biochem. Biophys. Res. Commun.* 286:.

[66724] Further studies establishing the function and utilities of TESK1 are found in John Hopkins OMIM database record ID 601782, and in cited publications numbered 1249–1250 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor EB (TFEB, Accession XM\_166390) is another VGAM1958 host target gene. TFEB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TFEB, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFEB BINDING SITE, designated SEQ ID:44240, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66725] Another function of VGAM1958 is therefore inhibition of Transcription Factor EB (TFEB, Accession XM\_166390), a gene which may function as a transcription factor. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFEB. The function of TFEB has been established by previous studies. Transcription factors of the basic helix-loop-helix zipper (bHLH-Zip) family contain a basic domain, used for DNA binding, and HLH and Zip domains, both used for oligomerization. TFEB was isolated from a human B-cell cDNA library using a binding sequence from the adenovirus major late promoter (Carr and Sharp, 1990). By interspecific backcross analysis, Steingrimsen et al. (1995) mapped the Tcfef gene in the mouse to chromosome 17 in a region of homology to human 6p21, which can be presumed to be the location of the human homolog.

[66726] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66727] Carr, C. S.; Sharp, P. A. : A helix-loop-helix protein related to the immunoglobulin E box-binding proteins. Molec. Cell. Biol. 10: 4384-4388, 1990. ; and

[66728] Steingrimsson, E.; Sawadogo, M.; Gilbert, D. J.; Zervos, A. S.; Brent, R.; Blonar, M. A.; Fisher, D. E.; Copeland, N. G.; Jenkins, N. A. : Murine chromosomal location of five bHLH-Zip t.

[66729] Further studies establishing the function and utilities of TFEB are found in John Hopkins OMIM database record ID 600744, and in cited publications numbered 758 and 12617 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transforming Growth Factor, Beta 3 (TGFB3, Accession NM\_003239) is another VGAM1958 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TGFB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB3 BINDING SITE, designated SEQ ID:9232,

to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66730] Another function of VGAM1958 is therefore inhibition of Transforming Growth Factor, Beta 3 (TGFB3, Accession NM\_003239), a gene which is involved in embryogenesis and cell differentiation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB3. The function of TGFB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126. Translocase of Inner Mitochondrial Membrane 23 Homolog (yeast) (TIMM23, Accession XM\_011891) is another VGAM1958 host target gene. TIMM23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMM23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM23 BINDING SITE, designated SEQ ID:30200, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66731] Another function of VGAM1958 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 23 Homolog (yeast) (TIMM23, Accession XM\_011891), a gene which translocates nuclear-encoded proteins into the mitochondrion. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM23. The function of TIMM23 has been established by previous studies. By searching EST databases for homologs of yeast TIMs, Bauer et al. (1999) identified a cDNA encoding TIMM23. Sequence analysis predicted that the 209-amino acid TIMM23 protein shares 22% amino acid identity with yeast Tim23 and contains 4 hydrophobic membrane-spanning segments that conserve the N-out/C-out topology of yeast TIMs. TIMM23 also has a 74-amino acid N-terminal hydrophilic segment that is dissimilar to the N-terminal hydrophilic domain of yeast Tim23. Northern blot analysis detected a 2.9-kb TIMM23 transcript that was highly expressed in heart and skeletal muscle, intermediately expressed in brain, and weakly expressed in pancreas, placenta, kidney, and liver. Western blot analysis showed that TIMM23 colocalizes with the inner membrane fraction of mitochondria as a 23-kD protein. TIMM23 is organized

into 2 distinct 110-kD complexes in the inner membrane, one containing TIMM17A (OMIM Ref. No. 605057) and the other containing TIMM17B (OMIM Ref. No. 300249).

Tim23, a key component of the yeast mitochondrial pre-protein translocase, is anchored in the inner membrane by its C-terminal domain and exposes an intermediate domain, which functions as a presequence receptor, in the intermembrane space. Donzeau et al. (2000) showed that the N-terminal domain of Tim23 is exposed on the surface of the outer membrane. The authors stated that the 2-membrane-spanning topology of Tim23 is a novel characteristic in membrane biology. By simultaneously integrating into 2 membranes, Tim23 forms contacts between the outer and inner mitochondrial membranes. Tethering the inner membrane translocase to the outer membrane facilitates the transfer of precursor proteins from the TOM complex to the TIM23 complex, thereby increasing the efficiency of protein import.

[66732] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66733] Bauer, M. F.; Gempel, K.; Reichert, A. S.; Rappold, G. A.; Lichtner, P.; Gerbitz, K.-D.; Neupert, W.; Brunner, M.; Hof-

mann, S. : Genetic and structural characterization of the human mitochondrial inner membrane translocase. J. Molec. Biol. 289: 69–82, 1999. ; and

[66734] Donzeau, M.; Kaldi, K.; Adam, A.; Paschen, S.; Wanner, G.; Guiard, B.; Bauer, M. F.; Neupert, W.; Brunner, M. : Tim23 links the inner and outer mitochondrial membranes. Cell 101: 401–.

[66735] Further studies establishing the function and utilities of TIMM23 are found in John Hopkins OMIM database record ID 605034, and in cited publications numbered 9210 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TIRAP (Accession NM\_052887) is another VGAM1958 host target gene. TIRAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIRAP BINDING SITE, designated SEQ ID:27472, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66736] Another function of VGAM1958 is therefore inhibition of TIRAP (Accession NM\_052887), a gene which is a adapter

involved in the TLR4 signaling pathway in the innate immune response. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIRAP. The function of TIRAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189. Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM\_003257) is another VGAM1958 host target gene. TJP1 BINDING SITE1 and TJP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TJP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP1 BINDING SITE1 and TJP1 BINDING SITE2, designated SEQ ID:9266 and SEQ ID:9264 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66737] Another function of VGAM1958 is therefore inhibition of Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM\_003257), a gene which colocalizes and interacts with cadherins in cells lacking tight junctions. Accord-

ingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP1. The function of TJP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. T-cell Leukemia, Homeobox 1 (TLX1, Accession NM\_005521) is another VGAM1958 host target gene. TLX1 BINDING SITE1 and TLX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TLX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLX1 BINDING SITE1 and TLX1 BINDING SITE2, designated SEQ ID:12045 and SEQ ID:30009 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66738] Another function of VGAM1958 is therefore inhibition of T-cell Leukemia, Homeobox 1 (TLX1, Accession NM\_005521), a gene which controls the spleen development. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLX1. The function of TLX1 and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1505. Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM\_005118) is another VGAM1958 host target gene. TNFSF15 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TNFSF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF15 BINDING SITE, designated SEQ ID:11599, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66739] Another function of VGAM1958 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM\_005118), a gene which acts as an autocrine factor to induce apoptosis in endothelial cells. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF15. The function of TNFSF15 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM350. Topoisomerase (DNA) III Alpha (TOP3A, Accession NM\_004618) is another VGAM1958 host target gene. TOP3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TOP3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOP3A BINDING SITE, designated SEQ ID:10961, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66740] Another function of VGAM1958 is therefore inhibition of Topoisomerase (DNA) III Alpha (TOP3A, Accession NM\_004618). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOP3A. Translocated Promoter Region (to activated MET oncogene) (TPR, Accession NM\_003292) is another VGAM1958 host target gene. TPR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TPR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TPR BINDING SITE, designated SEQ ID:9302, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66741] Another function of VGAM1958 is therefore inhibition of Translocated Promoter Region (to activated MET oncogene) (TPR, Accession NM\_003292), a gene which Large coiled coil protein; may be involved in nuclear protein import. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPR. The function of TPR has been established by previous studies. The TPR locus, which has been mapped to chromosome 1, expresses a 10-kb RNA in all human cell lines tested (Dean et al., 1985). In a cell line rendered tumorigenic with the direct-acting carcinogen N-methyl-N-prime-nitronitrosoguanidine (MNNG), Dean et al. (1987) defined an activated MET oncogene that expresses a novel 5.0-kb RNA transcript which is a hybrid RNA derived from a DNA rearrangement involving the TPR locus and the MET locus (on 7q; 164860). Although most of the hybrid RNA is derived from the MET oncogene, the 5-prime portion uses some exons from the TPR gene, presumably the promoter region. Oncogenic activation of

MET is reminiscent of the Philadelphia chromosomal translocation in chronic myeloid leukemia that generates the hybrid BCR/ABL tyrosine kinase p210 (see OMIM Ref. No. 151410). Gonzatti-Haces et al. (1988) identified the proteins encoded by the human TPR-MET oncogene and the human MET protooncogene. By fluorescence in situ hybridization, Miranda et al. (1994) assigned the TPR gene to 1q25.

[66742] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[66743] Dean, M.; Park, M.; Vande Woude, G. F. : Characterization of the rearranged TPR-MET oncogene breakpoint. *Molec. Cell. Biol.* 7: 921-924, 1987. ; and

[66744] Gonzatti-Haces, M.; Seth, A.; Park, M.; Copeland, T.; Oroszlan, S.; Vande Woude, G. F. : Characterization of the TPR-MET oncogene p65 and the MET protooncogene p140 protein-tyrosine kina.

[66745] Further studies establishing the function and utilities of TPR are found in John Hopkins OMIM database record ID 189940, and in cited publications numbered 182 and 12345-602 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tripartite

Motif-containing 14 (TRIM14, Accession NM\_014788) is another VGAM1958 host target gene. TRIM14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM14 BINDING SITE, designated SEQ ID:16666, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66746] Another function of VGAM1958 is therefore inhibition of Tripartite Motif-containing 14 (TRIM14, Accession NM\_014788), a gene which is composed of 3 zinc-binding domains and is involved in development and cell growth. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14. The function of TRIM14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM\_004621) is another VGAM1958 host target gene. TRPC6 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10972, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66747] Another function of VGAM1958 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM\_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Tuftelin 1 (TUFT1, Accession NM\_020127) is another VGAM1958 host target gene. TUFT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUFT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of TUFT1 BINDING SITE, designated SEQ ID:21317, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66748] Another function of VGAM1958 is therefore inhibition of Tuftelin 1 (TUFT1, Accession NM\_020127), a gene which appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUFT1. The function of TUFT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1152. Twist Homolog (acrocephalosyndactyly 3; Saethre-Chotzen syndrome) (Drosophila) (TWIST, Accession NM\_000474) is another VGAM1958 host target gene. TWIST BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TWIST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TWIST BINDING SITE, designated SEQ ID:6083, to the nucleotide sequence of

VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66749] Another function of VGAM1958 is therefore inhibition of Twist Homolog (acrocephalosyndactyly 3; Saethre-Chotzen syndrome) (*Drosophila*) (TWIST, Accession NM\_000474). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TWIST. Unc-119 Homolog (*C. elegans*) (UNC119, Accession NM\_054035) is another VGAM1958 host target gene. UNC119 BINDING SITE1 and UNC119 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UNC119, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC119 BINDING SITE1 and UNC119 BINDING SITE2, designated SEQ ID:27648 and SEQ ID:11621 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66750] Another function of VGAM1958 is therefore inhibition of Unc-119 Homolog (*C. elegans*) (UNC119, Accession NM\_054035), a gene which is expressed in the retina and

may play a role in the mechanism of photoreceptor neurotransmitter release through the synaptic vesicle cycle. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC119. The function of UNC119 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1044.

Williams–Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM\_031992) is another VGAM1958 host target gene. WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WBSCR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2, designated SEQ ID:25706 and SEQ ID:9649 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66751] Another function of VGAM1958 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 1

(WBSCR1, Accession NM\_031992), a gene which stimulates protein translation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR1. The function of WBSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_014919) is another VGAM1958 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE5, designated SEQ ID:17182, SEQ ID:28463, SEQ ID:28474, SEQ ID:28446 and SEQ ID:10996 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66752] Another function of VGAM1958 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Acces-

sion NM\_014919), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 3 (XRCC3, Accession NM\_005432) is another VGAM1958 host target gene. XRCC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XRCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC3 BINDING SITE, designated SEQ ID:11908, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66753] Another function of VGAM1958 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 3 (XRCC3, Accession NM\_005432), a gene which is required for meiotic recombination, synapto-

mal complex formation and cell cycle progression. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC3. The function of XRCC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1290. Zinc Finger Protein 103 Homolog (mouse) (ZFP103, Accession NM\_005667) is another VGAM1958 host target gene. ZFP103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZFP103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP103 BINDING SITE, designated SEQ ID:12218, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66754] Another function of VGAM1958 is therefore inhibition of Zinc Finger Protein 103 Homolog (mouse) (ZFP103, Accession NM\_005667). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP103. Zinc Finger Protein 136 (clone pHZ-20) (ZNF136, Accession

XM\_009075) is another VGAM1958 host target gene.

ZNF136 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF136 BINDING SITE, designated SEQ ID:30098, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66755] Another function of VGAM1958 is therefore inhibition of Zinc Finger Protein 136 (clone pHZ-20) (ZNF136, Accession XM\_009075). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF136. Zinc Finger Protein 215 (ZNF215, Accession NM\_013250) is another VGAM1958 host target gene. ZNF215 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF215 BINDING SITE, designated SEQ ID:14914, to the nucleotide

sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66756] Another function of VGAM1958 is therefore inhibition of Zinc Finger Protein 215 (ZNF215, Accession NM\_013250). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF215. Zinc Finger Protein 261 (ZNF261, Accession NM\_005096) is another VGAM1958 host target gene. ZNF261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF261 BINDING SITE, designated SEQ ID:11562, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66757] Another function of VGAM1958 is therefore inhibition of Zinc Finger Protein 261 (ZNF261, Accession NM\_005096). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF261. Zinc Finger Protein 278 (ZNF278, Accession NM\_032052) is another VGAM1958

host target gene. ZNF278 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF278, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF278 BINDING SITE, designated SEQ ID:25779, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66758] Another function of VGAM1958 is therefore inhibition of Zinc Finger Protein 278 (ZNF278, Accession NM\_032052), a gene which represses basal transcription as well as RNF4-mediated activation. Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF278. The function of ZNF278 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM414.A2BP1 (Accession NM\_018723) is another VGAM1958 host target gene. A2BP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by A2BP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A2BP1 BINDING SITE, designated SEQ ID:20806, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66759] Another function of VGAM1958 is therefore inhibition of A2BP1 (Accession NM\_018723). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A2BP1. ABIN-2 (Accession NM\_024309) is another VGAM1958 host target gene. ABIN-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABIN-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABIN-2 BINDING SITE, designated SEQ ID:23603, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66760] Another function of VGAM1958 is therefore inhibition of ABIN-2 (Accession NM\_024309). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABIN-2.

A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM\_005100) is another VGAM1958 host target gene. AKAP12 BINDING SITE1 and AKAP12 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP12, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP12 BINDING SITE1 and AKAP12 BINDING SITE2, designated SEQ ID:11571 and SEQ ID:29311 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66761] Another function of VGAM1958 is therefore inhibition of A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM\_005100). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP12. AMSH (Accession NM\_006463) is another VGAM1958 host target gene. AMSH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMSH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of AMSH BINDING SITE, designated SEQ ID:13180, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66762] Another function of VGAM1958 is therefore inhibition of AMSH (Accession NM\_006463). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMSH. AND-1 (Accession NM\_007086) is another VGAM1958 host target gene. AND-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AND-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AND-1 BINDING SITE, designated SEQ ID:13955, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66763] Another function of VGAM1958 is therefore inhibition of AND-1 (Accession NM\_007086). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AND-1. Ankyrin Repeat Domain 5 (ANKRD5, Accession NM\_022096) is another VGAM1958 host target gene.

ANKRD5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ANKRD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKRD5 BINDING SITE, designated SEQ ID:22635, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66764] Another function of VGAM1958 is therefore inhibition of Ankyrin Repeat Domain 5 (ANKRD5, Accession NM\_022096). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKRD5. Adaptor-related Protein Complex 3, Mu 2 Subunit (AP3M2, Accession NM\_006803) is another VGAM1958 host target gene. AP3M2 BINDING SITE1 and AP3M2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AP3M2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3M2 BINDING SITE1 and AP3M2 BINDING SITE2, designated SEQ

ID:13674 and SEQ ID:13677 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66765] Another function of VGAM1958 is therefore inhibition of Adaptor-related Protein Complex 3, Mu 2 Subunit (AP3M2, Accession NM\_006803). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M2. APCL (Accession NM\_005883) is another VGAM1958 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12500, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66766] Another function of VGAM1958 is therefore inhibition of APCL (Accession NM\_005883). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. APH2 (Accession NM\_032327) is another VGAM1958 host

target gene. APH2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by APH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APH2 BINDING SITE, designated SEQ ID:26135, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66767] Another function of VGAM1958 is therefore inhibition of APH2 (Accession NM\_032327). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APH2. ARHGAP11A (Accession NM\_014783) is another VGAM1958 host target gene. ARHGAP11A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARHGAP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP11A BINDING SITE, designated SEQ ID:16637, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66768] Another function of VGAM1958 is therefore inhibition of ARHGAP11A (Accession NM\_014783). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP11A. Rho Guanine Nucleotide Exchange Factor (GEF) 4 (ARHGEF4, Accession NM\_032995) is another VGAM1958 host target gene. ARHGEF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGEF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF4 BINDING SITE, designated SEQ ID:26874, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66769] Another function of VGAM1958 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 4 (ARHGEF4, Accession NM\_032995). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF4. ARL8 (Accession XM\_167671) is another VGAM1958 host target gene. ARL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by ARL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL8 BINDING SITE, designated SEQ ID:44765, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66770] Another function of VGAM1958 is therefore inhibition of ARL8 (Accession XM\_167671). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL8. ATPase, H<sup>+</sup> Transporting, Lysosomal V0 Subunit A Isoform 1 (ATP6V0A1, Accession NM\_005177) is another VGAM1958 host target gene. ATP6V0A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V0A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V0A1 BINDING SITE, designated SEQ ID:11676, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66771] Another function of VGAM1958 is therefore inhibition of

ATPase, H<sup>+</sup> Transporting, Lysosomal V0 Subunit A Iso-form 1 (ATP6V0A1, Accession NM\_005177). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V0A1. ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577) is another VGAM1958 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31077, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66772] Another function of VGAM1958 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. BANK (Accession NM\_017935) is another VGAM1958 host target gene. BANK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BANK,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BANK BINDING SITE, designated SEQ ID:19627, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66773] Another function of VGAM1958 is therefore inhibition of BANK (Accession NM\_017935). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANK. BCMP1 (Accession NM\_031442) is another VGAM1958 host target gene. BCMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:25459, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66774] Another function of VGAM1958 is therefore inhibition of BCMP1 (Accession NM\_031442). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with BCMP1. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536) is another VGAM1958 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10885, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66775] Another function of VGAM1958 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. BM045 (Accession NM\_018459) is another VGAM1958 host target gene. BM045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BM045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM045 BINDING SITE, designated SEQ

ID:20531, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66776] Another function of VGAM1958 is therefore inhibition of BM045 (Accession NM\_018459). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM045. BCL2/adenovirus E1B 19kDa Interacting Protein 2 (BNIP2, Accession XM\_039703) is another VGAM1958 host target gene. BNIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BNIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BNIP2 BINDING SITE, designated SEQ ID:33162, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66777] Another function of VGAM1958 is therefore inhibition of BCL2/adenovirus E1B 19kDa Interacting Protein 2 (BNIP2, Accession XM\_039703). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP2. Blepharophimosis, Epicanthus Inversus and Ptosis, Candi-

date 1 (BPESC1, Accession NM\_021812) is another VGAM1958 host target gene. BPESC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BPESC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPESC1 BINDING SITE, designated SEQ ID:22374, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66778] Another function of VGAM1958 is therefore inhibition of Blepharophimosis, Epicanthus Inversus and Ptosis, Candidate 1 (BPESC1, Accession NM\_021812). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPESC1. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM\_167769) is another VGAM1958 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE,

designated SEQ ID:44781, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66779] Another function of VGAM1958 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM\_167769). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. C16orf5 (Accession NM\_013399) is another VGAM1958 host target gene. C16orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C16orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:15057, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66780] Another function of VGAM1958 is therefore inhibition of C16orf5 (Accession NM\_013399). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf5. Chromosome 1 Open Reading Frame 24

(C1orf24, Accession NM\_052966) is another VGAM1958 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27529, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66781] Another function of VGAM1958 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM\_012261) is another VGAM1958 host target gene. C20orf103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf103 BINDING SITE, designated SEQ

ID:14571, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66782] Another function of VGAM1958 is therefore inhibition of Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM\_012261). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf103. Chromosome 20 Open Reading Frame 160 (C20orf160, Accession NM\_080625) is another VGAM1958 host target gene. C20orf160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf160 BINDING SITE, designated SEQ ID:27932, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66783] Another function of VGAM1958 is therefore inhibition of Chromosome 20 Open Reading Frame 160 (C20orf160, Accession NM\_080625). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with C20orf160. Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM\_080603) is another VGAM1958 host target gene. C20orf162 BINDING SITE1 and C20orf162 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C20orf162, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf162 BINDING SITE1 and C20orf162 BINDING SITE2, designated SEQ ID:27912 and SEQ ID:27917 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66784] Another function of VGAM1958 is therefore inhibition of Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM\_080603). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf162. Chromosome 20 Open Reading Frame 54 (C20orf54, Accession NM\_033409) is another VGAM1958 host target gene. C20orf54 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by C20orf54, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf54 BINDING SITE, designated SEQ ID:27227, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66785] Another function of VGAM1958 is therefore inhibition of Chromosome 20 Open Reading Frame 54 (C20orf54, Accession NM\_033409). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf54. Chromosome 21 Open Reading Frame 18 (C21orf18, Accession NM\_017438) is another VGAM1958 host target gene. C21orf18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf18 BINDING SITE, designated SEQ ID:18897, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66786] Another function of VGAM1958 is therefore inhibition of Chromosome 21 Open Reading Frame 18 (C21orf18, Accession NM\_017438). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf18. C3IP1 (Accession NM\_021633) is another VGAM1958 host target gene. C3IP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C3IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3IP1 BINDING SITE, designated SEQ ID:22274, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66787] Another function of VGAM1958 is therefore inhibition of C3IP1 (Accession NM\_021633). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3IP1. Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM\_032385) is another VGAM1958 host target gene. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C5orf4, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:26178 and SEQ ID:18473 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66788] Another function of VGAM1958 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM\_032385). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM\_032625) is another VGAM1958 host target gene. C7orf13 BINDING SITE1 and C7orf13 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C7orf13, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7orf13 BINDING SITE1 and C7orf13 BINDING SITE2, designated SEQ ID:26342 and SEQ ID:39656 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ

ID:4669.

[66789] Another function of VGAM1958 is therefore inhibition of Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM\_032625). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7orf13. Chromosome 9 Open Reading Frame 12 (C9orf12, Accession NM\_022755) is another VGAM1958 host target gene. C9orf12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C9orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf12 BINDING SITE, designated SEQ ID:22991, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66790] Another function of VGAM1958 is therefore inhibition of Chromosome 9 Open Reading Frame 12 (C9orf12, Accession NM\_022755). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf12. Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM\_017586)

is another VGAM1958 host target gene. C9orf7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C9orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf7 BINDING SITE, designated SEQ ID:19033, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66791] Another function of VGAM1958 is therefore inhibition of Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM\_017586). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf7. Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM\_018956) is another VGAM1958 host target gene. C9orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C9orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:21024, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[66792] Another function of VGAM1958 is therefore inhibition of Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM\_018956). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9. Calcium Channel, Voltage-dependent, Gamma Subunit 4 (CACNG4, Accession NM\_014405) is another VGAM1958 host target gene. CACNG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CACNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNG4 BINDING SITE, designated SEQ ID:15744, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66793] Another function of VGAM1958 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 4 (CACNG4, Accession NM\_014405). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG4. Calneuron 1 (CALN1, Accession NM\_031468) is

another VGAM1958 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25521, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66794] Another function of VGAM1958 is therefore inhibition of Calneuron 1 (CALN1, Accession NM\_031468). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549) is another VGAM1958 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:13312, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[66795] Another function of VGAM1958 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. Chromobox Homolog 1 (HP1 beta homolog *Drosophila*) (CBX1, Accession NM\_006807) is another VGAM1958 host target gene. CBX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CBX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX1 BINDING SITE, designated SEQ ID:13680, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66796] Another function of VGAM1958 is therefore inhibition of Chromobox Homolog 1 (HP1 beta homolog *Drosophila*) (CBX1, Accession NM\_006807). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX1. Chromobox Homolog 6 (CBX6, Accession NM\_014292) is

another VGAM1958 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15575, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66797] Another function of VGAM1958 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM\_014292). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. CD109 (Accession NM\_133493) is another VGAM1958 host target gene. CD109 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD109 BINDING SITE, designated SEQ ID:28569, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ

ID:4669.

[66798] Another function of VGAM1958 is therefore inhibition of CD109 (Accession NM\_133493). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD109. Cadherin-like 24 (CDH24, Accession XM\_170748) is another VGAM1958 host target gene. CDH24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH24 BINDING SITE, designated SEQ ID:45506, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66799] Another function of VGAM1958 is therefore inhibition of Cadherin-like 24 (CDH24, Accession XM\_170748). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH24. Cyclin-dependent Kinase-like 2 (CDC2-related kinase) (CDKL2, Accession NM\_003948) is another VGAM1958 host target gene. CDKL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by CDKL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKL2 BINDING SITE, designated SEQ ID:10071, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66800] Another function of VGAM1958 is therefore inhibition of Cyclin-dependent Kinase-like 2 (CDC2-related kinase) (CDKL2, Accession NM\_003948). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKL2. Centaurin, Alpha 1 (CENTA1, Accession NM\_006869) is another VGAM1958 host target gene. CENTA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTA1 BINDING SITE, designated SEQ ID:13740, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66801] Another function of VGAM1958 is therefore inhibition of

Centaurin, Alpha 1 (CENTA1, Accession NM\_006869). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTA1. Centaurin, Gamma 1 (CENTG1, Accession NM\_014770) is another VGAM1958 host target gene. CENTG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG1 BINDING SITE, designated SEQ ID:16567, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66802] Another function of VGAM1958 is therefore inhibition of Centaurin, Gamma 1 (CENTG1, Accession NM\_014770). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG1. CG012 (Accession XM\_096710) is another VGAM1958 host target gene. CG012 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CG012, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:40485, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66803] Another function of VGAM1958 is therefore inhibition of CG012 (Accession XM\_096710). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012. Chloride Intracellular Channel 4 (CLIC4, Accession NM\_013943) is another VGAM1958 host target gene. CLIC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLIC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC4 BINDING SITE, designated SEQ ID:15132, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66804] Another function of VGAM1958 is therefore inhibition of Chloride Intracellular Channel 4 (CLIC4, Accession NM\_013943). Accordingly, utilities of VGAM1958 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC4. Cyclin M4 (CNNM4, Accession NM\_020184) is another VGAM1958 host target gene. CNNM4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNNM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM4 BINDING SITE, designated SEQ ID:21427, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66805] Another function of VGAM1958 is therefore inhibition of Cyclin M4 (CNNM4, Accession NM\_020184). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM4. COP9 (Accession NM\_006710) is another VGAM1958 host target gene. COP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COP9 BINDING SITE,

designated SEQ ID:13535, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66806] Another function of VGAM1958 is therefore inhibition of COP9 (Accession NM\_006710). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COP9. CPR2 (Accession NM\_030900) is another VGAM1958 host target gene. CPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPR2 BINDING SITE, designated SEQ ID:25172, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66807] Another function of VGAM1958 is therefore inhibition of CPR2 (Accession NM\_030900). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPR2. Cysteine-rich with EGF-like Domains 1 (CRELD1, Accession NM\_015513) is another VGAM1958 host target gene.

CRELD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CRELD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRELD1 BINDING SITE, designated SEQ ID:17775, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66808] Another function of VGAM1958 is therefore inhibition of Cysteine-rich with EGF-like Domains 1 (CRELD1, Accession NM\_015513). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRELD1. CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM\_054838) is another VGAM1958 host target gene. CSMD1 BINDING SITE1 and CSMD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CSMD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE1 and CSMD1 BINDING SITE2, designated SEQ ID:36193 and SEQ ID:27070 re-

spectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66809] Another function of VGAM1958 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM\_054838). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. DDM36 (Accession NM\_020962) is another VGAM1958 host target gene. DDM36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDM36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDM36 BINDING SITE, designated SEQ ID:21955, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66810] Another function of VGAM1958 is therefore inhibition of DDM36 (Accession NM\_020962). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDM36. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide

12 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX12, Accession XM\_006936) is another VGAM1958 host target gene. DDX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX12 BINDING SITE, designated SEQ ID:30024, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66811] Another function of VGAM1958 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 12 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX12, Accession XM\_006936). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX12. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM1958 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16164, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66812] Another function of VGAM1958 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM\_002384) is another VGAM1958 host target gene. DGKD BINDING SITE1 and DGKD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DGKD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE1 and DGKD BINDING SITE2, designated SEQ ID:29879 and SEQ ID:29884 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66813] Another function of VGAM1958 is therefore inhibition of

Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM\_002384). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_000793) is another VGAM1958 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:6452 and SEQ ID:17300 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66814] Another function of VGAM1958 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_000793). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. DKFZp434C0328 (Accession NM\_017577) is another VGAM1958 host target gene. DKFZp434C0328 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by DKFZp434C0328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0328 BINDING SITE, designated SEQ ID:19012, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66815] Another function of VGAM1958 is therefore inhibition of DKFZp434C0328 (Accession NM\_017577). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0328. DKFZP434C0826 (Accession XM\_097248) is another VGAM1958 host target gene. DKFZP434C0826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434C0826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C0826 BINDING SITE, designated SEQ ID:40846, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66816] Another function of VGAM1958 is therefore inhibition of

DKFZP434C0826 (Accession XM\_097248). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C0826. DKFZP434C1715 (Accession XM\_098421) is another VGAM1958 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:41674, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66817] Another function of VGAM1958 is therefore inhibition of DKFZP434C1715 (Accession XM\_098421). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C1715. DKFZP434E2135 (Accession NM\_030804) is another VGAM1958 host target gene. DKFZP434E2135 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434E2135, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25119, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66818] Another function of VGAM1958 is therefore inhibition of DKFZP434E2135 (Accession NM\_030804). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. DKFZp434F1719 (Accession NM\_032248) is another VGAM1958 host target gene. DKFZp434F1719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434F1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F1719 BINDING SITE, designated SEQ ID:25986, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66819] Another function of VGAM1958 is therefore inhibition of DKFZp434F1719 (Accession NM\_032248). Accordingly,

utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F1719. DKFZP434H204 (Accession XM\_039153) is another VGAM1958 host target gene. DKFZP434H204 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434H204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H204 BINDING SITE, designated SEQ ID:33015, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66820] Another function of VGAM1958 is therefore inhibition of DKFZP434H204 (Accession XM\_039153). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H204. DKFZP434I216 (Accession XM\_085381) is another VGAM1958 host target gene. DKFZP434I216 BINDING SITE1 through DKFZP434I216 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP434I216, corresponding to HOST TARGET binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I216 BINDING SITE1 through DKFZP434I216 BINDING SITE3, designated SEQ ID:38099, SEQ ID:38101 and SEQ ID:38102 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66821] Another function of VGAM1958 is therefore inhibition of DKFZP434I216 (Accession XM\_085381). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I216. DKFZP434K2235 (Accession XM\_096869) is another VGAM1958 host target gene. DKFZP434K2235 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434K2235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K2235 BINDING SITE, designated SEQ ID:40595, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66822] Another function of VGAM1958 is therefore inhibition of

DKFZP434K2235 (Accession XM\_096869). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K2235. DKFZp434O0320 (Accession XM\_097012) is another VGAM1958 host target gene. DKFZp434O0320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434O0320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434O0320 BINDING SITE, designated SEQ ID:40706, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66823] Another function of VGAM1958 is therefore inhibition of DKFZp434O0320 (Accession XM\_097012). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0320. DKFZP434P0111 (Accession XM\_041116) is another VGAM1958 host target gene. DKFZP434P0111 BINDING SITE1 and DKFZP434P0111 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP434P0111,

corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE1 and DKFZP434P0111 BINDING SITE2, designated SEQ ID:33457 and SEQ ID:33450 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66824] Another function of VGAM1958 is therefore inhibition of DKFZP434P0111 (Accession XM\_041116). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111. DKFZP564O0463 (Accession NM\_014156) is another VGAM1958 host target gene. DKFZP564O0463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0463 BINDING SITE, designated SEQ ID:15445, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66825] Another function of VGAM1958 is therefore inhibition of DKFZP564O0463 (Accession NM\_014156). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0463. DKFZP566M1046 (Accession NM\_032127) is another VGAM1958 host target gene. DKFZP566M1046 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP566M1046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566M1046 BINDING SITE, designated SEQ ID:25812, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66826] Another function of VGAM1958 is therefore inhibition of DKFZP566M1046 (Accession NM\_032127). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566M1046. DKFZP586F1524 (Accession NM\_015584) is another VGAM1958 host target gene. DKFZP586F1524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DKFZP586F1524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586F1524 BINDING SITE, designated SEQ ID:17853, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66827] Another function of VGAM1958 is therefore inhibition of DKFZP586F1524 (Accession NM\_015584). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F1524. DKFZP727C091 (Accession XM\_038689) is another VGAM1958 host target gene. DKFZP727C091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP727C091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727C091 BINDING SITE, designated SEQ ID:32906, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66828] Another function of VGAM1958 is therefore inhibition of

DKFZP727C091 (Accession XM\_038689). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727C091. DKFZp761G2113 (Accession XM\_046017) is another VGAM1958 host target gene. DKFZp761G2113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761G2113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G2113 BINDING SITE, designated SEQ ID:34644, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66829] Another function of VGAM1958 is therefore inhibition of DKFZp761G2113 (Accession XM\_046017). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G2113. DKFZp761J139 (Accession NM\_032280) is another VGAM1958 host target gene. DKFZp761J139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761J139, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:26037, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66830] Another function of VGAM1958 is therefore inhibition of DKFZp761J139 (Accession NM\_032280). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J139. DKFZp761K1423 (Accession NM\_018422) is another VGAM1958 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:20469, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66831] Another function of VGAM1958 is therefore inhibition of DKFZp761K1423 (Accession NM\_018422). Accordingly,

utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423. DKFZp762K222 (Accession XM\_048721) is another VGAM1958 host target gene. DKFZp762K222 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp762K222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762K222 BINDING SITE, designated SEQ ID:35236, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66832] Another function of VGAM1958 is therefore inhibition of DKFZp762K222 (Accession XM\_048721). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762K222. DKFZp762P2111 (Accession XM\_098654) is another VGAM1958 host target gene. DKFZp762P2111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762P2111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762P2111 BINDING SITE, designated SEQ ID:41755, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66833] Another function of VGAM1958 is therefore inhibition of DKFZp762P2111 (Accession XM\_098654). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762P2111. Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM\_027569) is another VGAM1958 host target gene. DMWD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DMWD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMWD BINDING SITE, designated SEQ ID:30532, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66834] Another function of VGAM1958 is therefore inhibition of Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM\_027569). Accordingly, utilities of

VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMWD. DRIL2 (Accession NM\_006465) is another VGAM1958 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13189, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66835] Another function of VGAM1958 is therefore inhibition of DRIL2 (Accession NM\_006465). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. EAT2 (Accession XM\_086490) is another VGAM1958 host target gene. EAT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EAT2 BINDING SITE, designated SEQ

ID:38708, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66836] Another function of VGAM1958 is therefore inhibition of EAT2 (Accession XM\_086490). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EAT2. EMILIN-2 (Accession NM\_032048) is another VGAM1958 host target gene. EMILIN-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMILIN-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMILIN-2 BINDING SITE, designated SEQ ID:25767, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66837] Another function of VGAM1958 is therefore inhibition of EMILIN-2 (Accession NM\_032048). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMILIN-2. ENDOGLYX1 (Accession NM\_024756) is another VGAM1958 host target gene. ENDOGLYX1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENDOGLYX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENDOGLYX1 BINDING SITE, designated SEQ ID:24103, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66838] Another function of VGAM1958 is therefore inhibition of ENDOGLYX1 (Accession NM\_024756). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDOGLYX1. Ets2 Repressor Factor (ERF, Accession NM\_006494) is another VGAM1958 host target gene. ERF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERF BINDING SITE, designated SEQ ID:13234, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66839] Another function of VGAM1958 is therefore inhibition of

Ets2 Repressor Factor (ERF, Accession NM\_006494). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERF. FEM-2 (Accession NM\_014634) is another VGAM1958 host target gene. FEM-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FEM-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEM-2 BINDING SITE, designated SEQ ID:16006, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66840] Another function of VGAM1958 is therefore inhibition of FEM-2 (Accession NM\_014634). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEM-2. Fidgetin-like 1 (FIGNL1, Accession NM\_022116) is another VGAM1958 host target gene. FIGNL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FIGNL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FIGNL1 BINDING SITE, designated SEQ ID:22661, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66841] Another function of VGAM1958 is therefore inhibition of Fidgetin-like 1 (FIGNL1, Accession NM\_022116). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIGNL1. FKSG14 (Accession XM\_042025) is another VGAM1958 host target gene. FKSG14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FKSG14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKSG14 BINDING SITE, designated SEQ ID:33670, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66842] Another function of VGAM1958 is therefore inhibition of FKSG14 (Accession XM\_042025). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG14. FLJ00024 (Accession XM\_033361) is another

VGAM1958 host target gene. FLJ00024 BINDING SITE1 and FLJ00024 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ00024, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE1 and FLJ00024 BINDING SITE2, designated SEQ ID:31891 and SEQ ID:31894 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66843] Another function of VGAM1958 is therefore inhibition of FLJ00024 (Accession XM\_033361). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. FLJ10101 (Accession NM\_024718) is another VGAM1958 host target gene. FLJ10101 BINDING SITE1 and FLJ10101 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10101, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10101 BINDING SITE1 and FLJ10101

BINDING SITE2, designated SEQ ID:24044 and SEQ ID:24047 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66844] Another function of VGAM1958 is therefore inhibition of FLJ10101 (Accession NM\_024718). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10101. FLJ10342 (Accession NM\_018064) is another VGAM1958 host target gene. FLJ10342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10342 BINDING SITE, designated SEQ ID:19834, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66845] Another function of VGAM1958 is therefore inhibition of FLJ10342 (Accession NM\_018064). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10342. FLJ10388 (Accession NM\_018082) is another

VGAM1958 host target gene. FLJ10388 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10388 BINDING SITE, designated SEQ ID:19842, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66846] Another function of VGAM1958 is therefore inhibition of FLJ10388 (Accession NM\_018082). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10388. FLJ10420 (Accession NM\_018090) is another VGAM1958 host target gene. FLJ10420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10420 BINDING SITE, designated SEQ ID:19858, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66847] Another function of VGAM1958 is therefore inhibition of FLJ10420 (Accession NM\_018090). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10420. FLJ10713 (Accession NM\_018189) is another VGAM1958 host target gene. FLJ10713 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10713 BINDING SITE, designated SEQ ID:20040, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66848] Another function of VGAM1958 is therefore inhibition of FLJ10713 (Accession NM\_018189). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10713. FLJ10751 (Accession NM\_018205) is another VGAM1958 host target gene. FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10751, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2, designated SEQ ID:20095 and SEQ ID:20194 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66849] Another function of VGAM1958 is therefore inhibition of FLJ10751 (Accession NM\_018205). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751. FLJ10803 (Accession NM\_018224) is another VGAM1958 host target gene. FLJ10803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10803 BINDING SITE, designated SEQ ID:20152, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66850] Another function of VGAM1958 is therefore inhibition of FLJ10803 (Accession NM\_018224). Accordingly, utilities of

VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10803. FLJ10811 (Accession NM\_018228) is another VGAM1958 host target gene. FLJ10811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10811 BINDING SITE, designated SEQ ID:20165, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66851] Another function of VGAM1958 is therefore inhibition of FLJ10811 (Accession NM\_018228). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10811. FLJ10829 (Accession NM\_018234) is another VGAM1958 host target gene. FLJ10829 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10829

BINDING SITE, designated SEQ ID:20180, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66852] Another function of VGAM1958 is therefore inhibition of FLJ10829 (Accession NM\_018234). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10829. FLJ10849 (Accession NM\_018243) is another VGAM1958 host target gene. FLJ10849 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10849, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10849 BINDING SITE, designated SEQ ID:20205, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66853] Another function of VGAM1958 is therefore inhibition of FLJ10849 (Accession NM\_018243). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10849. FLJ10895 (Accession NM\_019084) is another VGAM1958 host target gene. FLJ10895 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10895 BINDING SITE, designated SEQ ID:21158, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66854] Another function of VGAM1958 is therefore inhibition of FLJ10895 (Accession NM\_019084). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10895. FLJ10925 (Accession NM\_018275) is another VGAM1958 host target gene. FLJ10925 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10925 BINDING SITE, designated SEQ ID:20260, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66855] Another function of VGAM1958 is therefore inhibition of

FLJ10925 (Accession NM\_018275). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10925. FLJ11362 (Accession NM\_021946) is another VGAM1958 host target gene. FLJ11362 BINDING SITE1 and FLJ11362 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ11362, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11362 BINDING SITE1 and FLJ11362 BINDING SITE2, designated SEQ ID:22470 and SEQ ID:22472 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66856] Another function of VGAM1958 is therefore inhibition of FLJ11362 (Accession NM\_021946). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11362. FLJ11726 (Accession NM\_024971) is another VGAM1958 host target gene. FLJ11726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11726, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11726 BINDING SITE, designated SEQ ID:24527, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66857] Another function of VGAM1958 is therefore inhibition of FLJ11726 (Accession NM\_024971). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11726. FLJ12057 (Accession NM\_024768) is another VGAM1958 host target gene. FLJ12057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12057 BINDING SITE, designated SEQ ID:24127, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66858] Another function of VGAM1958 is therefore inhibition of FLJ12057 (Accession NM\_024768). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12057. FLJ12484 (Accession NM\_022767) is another VGAM1958 host target gene. FLJ12484 BINDING SITE1 through FLJ12484 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12484, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12484 BINDING SITE1 through FLJ12484 BINDING SITE4, designated SEQ ID:23016, SEQ ID:23020, SEQ ID:34514 and SEQ ID:34518 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66859] Another function of VGAM1958 is therefore inhibition of FLJ12484 (Accession NM\_022767). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12484. FLJ12700 (Accession NM\_024910) is another VGAM1958 host target gene. FLJ12700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:24413, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66860] Another function of VGAM1958 is therefore inhibition of FLJ12700 (Accession NM\_024910). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12700. FLJ12783 (Accession NM\_031426) is another VGAM1958 host target gene. FLJ12783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12783 BINDING SITE, designated SEQ ID:25422, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66861] Another function of VGAM1958 is therefore inhibition of FLJ12783 (Accession NM\_031426). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12783. FLJ12960 (Accession NM\_024638) is another

VGAM1958 host target gene. FLJ12960 BINDING SITE1 and FLJ12960 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12960, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE1 and FLJ12960 BINDING SITE2, designated SEQ ID:23912 and SEQ ID:23916 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66862] Another function of VGAM1958 is therefore inhibition of FLJ12960 (Accession NM\_024638). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960. FLJ13055 (Accession NM\_022737) is another VGAM1958 host target gene. FLJ13055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13055 BINDING SITE, designated SEQ ID:22944, to the nucleotide

sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66863] Another function of VGAM1958 is therefore inhibition of FLJ13055 (Accession NM\_022737). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13055. FLJ13114 (Accession NM\_024541) is another VGAM1958 host target gene. FLJ13114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:23750, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66864] Another function of VGAM1958 is therefore inhibition of FLJ13114 (Accession NM\_024541). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114. FLJ13154 (Accession NM\_024598) is another VGAM1958 host target gene. FLJ13154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ13154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13154 BINDING SITE, designated SEQ ID:23836, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66865] Another function of VGAM1958 is therefore inhibition of FLJ13154 (Accession NM\_024598). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13154. FLJ13189 (Accession NM\_024882) is another VGAM1958 host target gene. FLJ13189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE, designated SEQ ID:24327, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66866] Another function of VGAM1958 is therefore inhibition of FLJ13189 (Accession NM\_024882). Accordingly, utilities of

VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13189. FLJ13213 (Accession NM\_024755) is another VGAM1958 host target gene. FLJ13213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13213 BINDING SITE, designated SEQ ID:24099, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66867] Another function of VGAM1958 is therefore inhibition of FLJ13213 (Accession NM\_024755). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13213. FLJ13224 (Accession NM\_024799) is another VGAM1958 host target gene. FLJ13224 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13224

BINDING SITE, designated SEQ ID:24177, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66868] Another function of VGAM1958 is therefore inhibition of FLJ13224 (Accession NM\_024799). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13224. FLJ13241 (Accession NM\_025088) is another VGAM1958 host target gene. FLJ13241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13241 BINDING SITE, designated SEQ ID:24708, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66869] Another function of VGAM1958 is therefore inhibition of FLJ13241 (Accession NM\_025088). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13241. FLJ13262 (Accession NM\_024914) is another VGAM1958 host target gene. FLJ13262 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13262 BINDING SITE, designated SEQ ID:24432, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66870] Another function of VGAM1958 is therefore inhibition of FLJ13262 (Accession NM\_024914). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13262. FLJ13615 (Accession NM\_025114) is another VGAM1958 host target gene. FLJ13615 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13615 BINDING SITE, designated SEQ ID:24763, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66871] Another function of VGAM1958 is therefore inhibition of

FLJ13615 (Accession NM\_025114). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13615. FLJ13659 (Accession NM\_025189) is another VGAM1958 host target gene. FLJ13659 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13659 BINDING SITE, designated SEQ ID:24832, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66872] Another function of VGAM1958 is therefore inhibition of FLJ13659 (Accession NM\_025189). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13659. FLJ13693 (Accession NM\_024807) is another VGAM1958 host target gene. FLJ13693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ13693 BINDING SITE, designated SEQ ID:24185, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66873] Another function of VGAM1958 is therefore inhibition of FLJ13693 (Accession NM\_024807). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13693. FLJ13910 (Accession NM\_022780) is another VGAM1958 host target gene. FLJ13910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13910 BINDING SITE, designated SEQ ID:23057, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66874] Another function of VGAM1958 is therefore inhibition of FLJ13910 (Accession NM\_022780). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13910. FLJ14106 (Accession NM\_025067) is another

VGAM1958 host target gene. FLJ14106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14106 BINDING SITE, designated SEQ ID:24665, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66875] Another function of VGAM1958 is therefore inhibition of FLJ14106 (Accession NM\_025067). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14106. FLJ14146 (Accession NM\_024709) is another VGAM1958 host target gene. FLJ14146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:24033, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66876] Another function of VGAM1958 is therefore inhibition of FLJ14146 (Accession NM\_024709). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146. FLJ14327 (Accession NM\_024912) is another VGAM1958 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24420, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66877] Another function of VGAM1958 is therefore inhibition of FLJ14327 (Accession NM\_024912). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327. FLJ14451 (Accession NM\_032786) is another VGAM1958 host target gene. FLJ14451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14451 BINDING SITE, designated SEQ ID:26539, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66878] Another function of VGAM1958 is therefore inhibition of FLJ14451 (Accession NM\_032786). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14451. FLJ14564 (Accession XM\_084459) is another VGAM1958 host target gene. FLJ14564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14564 BINDING SITE, designated SEQ ID:37598, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66879] Another function of VGAM1958 is therefore inhibition of FLJ14564 (Accession XM\_084459). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14564. FLJ14810 (Accession NM\_032843) is another VGAM1958 host target gene. FLJ14810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14810 BINDING SITE, designated SEQ ID:26630, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66880] Another function of VGAM1958 is therefore inhibition of FLJ14810 (Accession NM\_032843). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14810. FLJ20034 (Accession NM\_017630) is another VGAM1958 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:19129, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM

RNA, also designated SEQ ID:4669.

[66881] Another function of VGAM1958 is therefore inhibition of FLJ20034 (Accession NM\_017630). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. FLJ20040 (Accession NM\_018992) is another VGAM1958 host target gene. FLJ20040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20040 BINDING SITE, designated SEQ ID:21068, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66882] Another function of VGAM1958 is therefore inhibition of FLJ20040 (Accession NM\_018992). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20040. FLJ20294 (Accession NM\_017749) is another VGAM1958 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19349, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66883] Another function of VGAM1958 is therefore inhibition of FLJ20294 (Accession NM\_017749). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ20298 (Accession NM\_017752) is another VGAM1958 host target gene. FLJ20298 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20298 BINDING SITE, designated SEQ ID:19364, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66884] Another function of VGAM1958 is therefore inhibition of FLJ20298 (Accession NM\_017752). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20298. FLJ20320 (Accession NM\_017765) is another VGAM1958 host target gene. FLJ20320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20320 BINDING SITE, designated SEQ ID:19381, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66885] Another function of VGAM1958 is therefore inhibition of FLJ20320 (Accession NM\_017765). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20320. FLJ20375 (Accession NM\_017794) is another VGAM1958 host target gene. FLJ20375 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20375, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20375 BINDING SITE, designated SEQ ID:19432, to the nucleotide

sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66886] Another function of VGAM1958 is therefore inhibition of FLJ20375 (Accession NM\_017794). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20375. FLJ20401 (Accession NM\_017805) is another VGAM1958 host target gene. FLJ20401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20401 BINDING SITE, designated SEQ ID:19447, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66887] Another function of VGAM1958 is therefore inhibition of FLJ20401 (Accession NM\_017805). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20401. FLJ20413 (Accession NM\_017808) is another VGAM1958 host target gene. FLJ20413 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ20413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20413 BINDING SITE, designated SEQ ID:19452, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66888] Another function of VGAM1958 is therefore inhibition of FLJ20413 (Accession NM\_017808). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413. FLJ20421 (Accession NM\_017813) is another VGAM1958 host target gene. FLJ20421 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20421 BINDING SITE, designated SEQ ID:19461, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66889] Another function of VGAM1958 is therefore inhibition of FLJ20421 (Accession NM\_017813). Accordingly, utilities of

VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20421. FLJ20435 (Accession NM\_017821) is another VGAM1958 host target gene. FLJ20435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20435 BINDING SITE, designated SEQ ID:19470, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66890] Another function of VGAM1958 is therefore inhibition of FLJ20435 (Accession NM\_017821). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20435. FLJ20508 (Accession NM\_017850) is another VGAM1958 host target gene. FLJ20508 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20508

BINDING SITE, designated SEQ ID:19519, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66891] Another function of VGAM1958 is therefore inhibition of FLJ20508 (Accession NM\_017850). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20508. FLJ20539 (Accession NM\_017870) is another VGAM1958 host target gene. FLJ20539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20539 BINDING SITE, designated SEQ ID:19542, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66892] Another function of VGAM1958 is therefore inhibition of FLJ20539 (Accession NM\_017870). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20539. FLJ20584 (Accession NM\_017891) is another VGAM1958 host target gene. FLJ20584 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20584 BINDING SITE, designated SEQ ID:19557, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66893] Another function of VGAM1958 is therefore inhibition of FLJ20584 (Accession NM\_017891). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20584. FLJ20668 (Accession NM\_017923) is another VGAM1958 host target gene. FLJ20668 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20668 BINDING SITE, designated SEQ ID:19588, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66894] Another function of VGAM1958 is therefore inhibition of

FLJ20668 (Accession NM\_017923). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20668. FLJ20671 (Accession NM\_017924) is another VGAM1958 host target gene. FLJ20671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20671 BINDING SITE, designated SEQ ID:19591, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66895] Another function of VGAM1958 is therefore inhibition of FLJ20671 (Accession NM\_017924). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20671. FLJ20695 (Accession NM\_017929) is another VGAM1958 host target gene. FLJ20695 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ20695 BINDING SITE, designated SEQ ID:19614, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66896] Another function of VGAM1958 is therefore inhibition of FLJ20695 (Accession NM\_017929). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20695. FLJ20783 (Accession NM\_017958) is another VGAM1958 host target gene. FLJ20783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20783 BINDING SITE, designated SEQ ID:19671, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66897] Another function of VGAM1958 is therefore inhibition of FLJ20783 (Accession NM\_017958). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20783. FLJ21032 (Accession NM\_024906) is another

VGAM1958 host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21032 BINDING SITE, designated SEQ ID:24399, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66898] Another function of VGAM1958 is therefore inhibition of FLJ21032 (Accession NM\_024906). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. FLJ21324 (Accession XM\_165988) is another VGAM1958 host target gene. FLJ21324 BINDING SITE1 and FLJ21324 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ21324, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21324 BINDING SITE1 and FLJ21324 BINDING SITE2, designated SEQ ID:43827 and SEQ ID:43829 respectively, to the nucleotide sequence of

VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66899] Another function of VGAM1958 is therefore inhibition of FLJ21324 (Accession XM\_165988). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21324. FLJ21841 (Accession NM\_024609) is another VGAM1958 host target gene. FLJ21841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21841 BINDING SITE, designated SEQ ID:23863, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66900] Another function of VGAM1958 is therefore inhibition of FLJ21841 (Accession NM\_024609). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21841. FLJ22167 (Accession NM\_024533) is another VGAM1958 host target gene. FLJ22167 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ22167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:23741, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66901] Another function of VGAM1958 is therefore inhibition of FLJ22167 (Accession NM\_024533). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167. FLJ22283 (Accession NM\_032220) is another VGAM1958 host target gene. FLJ22283 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22283 BINDING SITE, designated SEQ ID:25945, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66902] Another function of VGAM1958 is therefore inhibition of FLJ22283 (Accession NM\_032220). Accordingly, utilities of

VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22283. FLJ22405 (Accession NM\_022485) is another VGAM1958 host target gene. FLJ22405 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22405 BINDING SITE, designated SEQ ID:22865, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66903] Another function of VGAM1958 is therefore inhibition of FLJ22405 (Accession NM\_022485). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22405. FLJ22593 (Accession NM\_024703) is another VGAM1958 host target gene. FLJ22593 BINDING SITE1 and FLJ22593 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ22593, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FLJ22593 BINDING SITE1 and FLJ22593 BINDING SITE2, designated SEQ ID:24018 and SEQ ID:24019 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66904] Another function of VGAM1958 is therefore inhibition of FLJ22593 (Accession NM\_024703). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22593. FLJ22969 (Accession XM\_044006) is another VGAM1958 host target gene. FLJ22969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22969 BINDING SITE, designated SEQ ID:34065, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66905] Another function of VGAM1958 is therefore inhibition of FLJ22969 (Accession XM\_044006). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22969. FLJ23027 (Accession NM\_032233) is another VGAM1958 host target gene. FLJ23027 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23027 BINDING SITE, designated SEQ ID:25954, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66906] Another function of VGAM1958 is therefore inhibition of FLJ23027 (Accession NM\_032233). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23027. FLJ23058 (Accession NM\_024696) is another VGAM1958 host target gene. FLJ23058 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23058 BINDING SITE, designated SEQ ID:24004, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM

RNA, also designated SEQ ID:4669.

[66907] Another function of VGAM1958 is therefore inhibition of FLJ23058 (Accession NM\_024696). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23058. FLJ23129 (Accession NM\_024763) is another VGAM1958 host target gene. FLJ23129 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23129 BINDING SITE, designated SEQ ID:24121, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66908] Another function of VGAM1958 is therefore inhibition of FLJ23129 (Accession NM\_024763). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23129. FLJ23309 (Accession NM\_024896) is another VGAM1958 host target gene. FLJ23309 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23309, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23309 BINDING SITE, designated SEQ ID:24377, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66909] Another function of VGAM1958 is therefore inhibition of FLJ23309 (Accession NM\_024896). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23309. FLJ25416 (Accession NM\_145018) is another VGAM1958 host target gene. FLJ25416 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ25416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25416 BINDING SITE, designated SEQ ID:29626, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66910] Another function of VGAM1958 is therefore inhibition of FLJ25416 (Accession NM\_145018). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ25416. FLJ31101 (Accession NM\_017964) is another VGAM1958 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:19683, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66911] Another function of VGAM1958 is therefore inhibition of FLJ31101 (Accession NM\_017964). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. FLJ32334 (Accession NM\_144565) is another VGAM1958 host target gene. FLJ32334 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:29364, to the nucleotide

sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66912] Another function of VGAM1958 is therefore inhibition of FLJ32334 (Accession NM\_144565). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334. Frequentin Homolog (Drosophila) (FREQ, Accession NM\_014286) is another VGAM1958 host target gene. FREQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FREQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREQ BINDING SITE, designated SEQ ID:15561, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66913] Another function of VGAM1958 is therefore inhibition of Frequentin Homolog (Drosophila) (FREQ, Accession NM\_014286). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREQ. Far Upstream Element (FUSE) Binding Protein 3 (FUBP3, Accession XM\_033327) is another VGAM1958 host target gene.

FUBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUBP3 BINDING SITE, designated SEQ ID:31877, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66914] Another function of VGAM1958 is therefore inhibition of Far Upstream Element (FUSE) Binding Protein 3 (FUBP3, Accession XM\_033327). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUBP3. GAPCENA (Accession NM\_012197) is another VGAM1958 host target gene. GAPCENA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAPCENA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAPCENA BINDING SITE, designated SEQ ID:14495, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4669.

[66915] Another function of VGAM1958 is therefore inhibition of GAPCENA (Accession NM\_012197). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAPCENA. GBTS1 (Accession NM\_145173) is another VGAM1958 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE, designated SEQ ID:29730, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66916] Another function of VGAM1958 is therefore inhibition of GBTS1 (Accession NM\_145173). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBTS1. G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM\_014030) is another VGAM1958 host target gene. GIT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

GIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT1 BINDING SITE, designated SEQ ID:15255, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66917] Another function of VGAM1958 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM\_014030). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT1. Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM\_004485) is another VGAM1958 host target gene. GNG4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:10809, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66918] Another function of VGAM1958 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 4

(GNG4, Accession NM\_004485). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4. Glycoprotein V (platelet) (GP5, Accession NM\_004488) is another VGAM1958 host target gene. GP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:10823, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66919] Another function of VGAM1958 is therefore inhibition of Glycoprotein V (platelet) (GP5, Accession NM\_004488). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5. Glycoprotein A33 (transmembrane) (GPA33, Accession NM\_005814) is another VGAM1958 host target gene. GPA33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPA33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPA33 BINDING SITE, designated SEQ ID:12405, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66920] Another function of VGAM1958 is therefore inhibition of Glycoprotein A33 (transmembrane) (GPA33, Accession NM\_005814). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPA33. GR6 (Accession NM\_007354) is another VGAM1958 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:14286, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66921] Another function of VGAM1958 is therefore inhibition of GR6 (Accession NM\_007354). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6.

GS3955 (Accession NM\_021643) is another VGAM1958 host target gene. GS3955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GS3955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GS3955 BINDING SITE, designated SEQ ID:22304, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66922] Another function of VGAM1958 is therefore inhibition of GS3955 (Accession NM\_021643). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GS3955. General Transcription Factor IIIC, Polypeptide 2, Beta 110kDa (GTF3C2, Accession NM\_001521) is another VGAM1958 host target gene. GTF3C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTF3C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF3C2 BINDING SITE, designated SEQ ID:7262, to the nucleotide

sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66923] Another function of VGAM1958 is therefore inhibition of General Transcription Factor IIIC, Polypeptide 2, Beta 110kDa (GTF3C2, Accession NM\_001521). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF3C2. H-L(3)MBT (Accession NM\_015478) is another VGAM1958 host target gene. H-L(3)MBT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H-L(3)MBT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-L(3)MBT BINDING SITE, designated SEQ ID:17754, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66924] Another function of VGAM1958 is therefore inhibition of H-L(3)MBT (Accession NM\_015478). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-L(3)MBT. H-plk (Accession NM\_015852) is another VGAM1958 host target gene. H-plk BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by H-plk, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-plk BINDING SITE, designated SEQ ID:17982, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66925] Another function of VGAM1958 is therefore inhibition of H-plk (Accession NM\_015852). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-plk. HCA4 (Accession XM\_085287) is another VGAM1958 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38028, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66926] Another function of VGAM1958 is therefore inhibition of

HCA4 (Accession XM\_085287). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. Hect Domain and RLD 3 (HERC3, Accession NM\_014606) is another VGAM1958 host target gene. HERC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HERC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HERC3 BINDING SITE, designated SEQ ID:15971, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66927] Another function of VGAM1958 is therefore inhibition of Hect Domain and RLD 3 (HERC3, Accession NM\_014606). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HERC3. Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM\_014571) is another VGAM1958 host target gene. HEYL BINDING SITE1 and HEYL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HEYL, corresponding to HOST TARGET binding sites such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEYL BINDING SITE1 and HEYL BINDING SITE2, designated SEQ ID:15927 and SEQ ID:15933 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66928] Another function of VGAM1958 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM\_014571). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEYL. HRIHFB2436 (Accession NM\_014345) is another VGAM1958 host target gene. HRIHFB2436 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HRIHFB2436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRIHFB2436 BINDING SITE, designated SEQ ID:15664, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66929] Another function of VGAM1958 is therefore inhibition of HRIHFB2436 (Accession NM\_014345). Accordingly, utili-

ties of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2436. HSA404617 (Accession XM\_052600) is another VGAM1958 host target gene. HSA404617 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSA404617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA404617 BINDING SITE, designated SEQ ID:36002, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66930] Another function of VGAM1958 is therefore inhibition of HSA404617 (Accession XM\_052600). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA404617. HSNOV1 (Accession NM\_017515) is another VGAM1958 host target gene. HSNOV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSNOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSNOV1

BINDING SITE, designated SEQ ID:18966, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66931] Another function of VGAM1958 is therefore inhibition of HSNOV1 (Accession NM\_017515). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSNOV1. Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM\_014424) is another VGAM1958 host target gene. HSPB7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPB7 BINDING SITE, designated SEQ ID:15781, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66932] Another function of VGAM1958 is therefore inhibition of Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM\_014424). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with HSPB7. HSPC055 (Accession NM\_014153) is another VGAM1958 host target gene. HSPC055 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC055 BINDING SITE, designated SEQ ID:15435, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66933] Another function of VGAM1958 is therefore inhibition of HSPC055 (Accession NM\_014153). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC055. HSU79303 (Accession NM\_013301) is another VGAM1958 host target gene. HSU79303 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSU79303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSU79303 BINDING SITE, designated SEQ ID:14961, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[66934] Another function of VGAM1958 is therefore inhibition of HSU79303 (Accession NM\_013301). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU79303. Integrin, Beta 8 (ITGB8, Accession NM\_002214) is another VGAM1958 host target gene. ITGB8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ITGB8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB8 BINDING SITE, designated SEQ ID:7979, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66935] Another function of VGAM1958 is therefore inhibition of Integrin, Beta 8 (ITGB8, Accession NM\_002214). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB8. Junctional Adhesion Molecule 1 (JAM1, Accession NM\_016946) is another VGAM1958 host target gene. JAM1 BINDING SITE1 through JAM1 BINDING SITE4 are HOST TARGET binding sites found in untranslated re-

gions of mRNA encoded by JAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE1 through JAM1 BINDING SITE4, designated SEQ ID:18858, SEQ ID:29325, SEQ ID:29334 and SEQ ID:29345 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66936] Another function of VGAM1958 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM\_016946). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM\_002251) is another VGAM1958 host target gene. KCNS1 BINDING SITE1 and KCNS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KCNS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS1 BINDING SITE1 and KCNS1 BINDING SITE2, desig-

nated SEQ ID:8044 and SEQ ID:8047 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66937] Another function of VGAM1958 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM\_002251). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS1. KH Domain Containing, RNA Binding, Signal Transduction Associated 3 (KHDRBS3, Accession NM\_006558) is another VGAM1958 host target gene. KHDRBS3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KHDRBS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KHDRBS3 BINDING SITE, designated SEQ ID:13326, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66938] Another function of VGAM1958 is therefore inhibition of KH Domain Containing, RNA Binding, Signal Transduction Associated 3 (KHDRBS3, Accession NM\_006558). Accord-

ingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KHDRBS3. KIAA0014 (Accession NM\_014665) is another VGAM1958 host target gene. KIAA0014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:16115, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66939] Another function of VGAM1958 is therefore inhibition of KIAA0014 (Accession NM\_014665). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014. KIAA0053 (Accession NM\_014882) is another VGAM1958 host target gene. KIAA0053 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0053 BINDING SITE, designated SEQ ID:17031, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66940] Another function of VGAM1958 is therefore inhibition of KIAA0053 (Accession NM\_014882). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0053. KIAA0121 (Accession XM\_052386) is another VGAM1958 host target gene. KIAA0121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE, designated SEQ ID:35970, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66941] Another function of VGAM1958 is therefore inhibition of KIAA0121 (Accession XM\_052386). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. KIAA0141 (Accession NM\_014773) is another VGAM1958 host target gene. KIAA0141 BINDING SITE1

and KIAA0141 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0141, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0141 BINDING SITE1 and KIAA0141 BINDING SITE2, designated SEQ ID:16583 and SEQ ID:16585 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66942] Another function of VGAM1958 is therefore inhibition of KIAA0141 (Accession NM\_014773). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0141. KIAA0146 (Accession XM\_088282) is another VGAM1958 host target gene. KIAA0146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0146 BINDING SITE, designated SEQ ID:39583, to the nucleotide sequence of VGAM1958 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4669.

[66943] Another function of VGAM1958 is therefore inhibition of KIAA0146 (Accession XM\_088282). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0146. KIAA0152 (Accession NM\_014730) is another VGAM1958 host target gene. KIAA0152 BINDING SITE1 and KIAA0152 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0152, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE1 and KIAA0152 BINDING SITE2, designated SEQ ID:16334 and SEQ ID:16339 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66944] Another function of VGAM1958 is therefore inhibition of KIAA0152 (Accession NM\_014730). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. KIAA0161 (Accession NM\_014746) is another VGAM1958 host target gene. KIAA0161 BINDING SITE1

and KIAA0161 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0161, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0161 BINDING SITE1 and KIAA0161 BINDING SITE2, designated SEQ ID:16431 and SEQ ID:32824 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66945] Another function of VGAM1958 is therefore inhibition of KIAA0161 (Accession NM\_014746). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0161. KIAA0247 (Accession NM\_014734) is another VGAM1958 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16375, to the nucleotide sequence of VGAM1958 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4669.

[66946] Another function of VGAM1958 is therefore inhibition of KIAA0247 (Accession NM\_014734). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0265 (Accession XM\_045954) is another VGAM1958 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34623, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66947] Another function of VGAM1958 is therefore inhibition of KIAA0265 (Accession XM\_045954). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA0266 (Accession NM\_021645) is another VGAM1958 host target gene. KIAA0266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0266, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0266 BINDING SITE, designated SEQ ID:22308, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66948] Another function of VGAM1958 is therefore inhibition of KIAA0266 (Accession NM\_021645). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0266. KIAA0298 (Accession XM\_084529) is another VGAM1958 host target gene. KIAA0298 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0298 BINDING SITE, designated SEQ ID:37626, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66949] Another function of VGAM1958 is therefore inhibition of KIAA0298 (Accession XM\_084529). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0298. KIAA0318 (Accession XM\_044334) is another VGAM1958 host target gene. KIAA0318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0318 BINDING SITE, designated SEQ ID:34186, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66950] Another function of VGAM1958 is therefore inhibition of KIAA0318 (Accession XM\_044334). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0318. KIAA0321 (Accession XM\_031077) is another VGAM1958 host target gene. KIAA0321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0321 BINDING SITE, designated SEQ ID:31266, to the

nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66951] Another function of VGAM1958 is therefore inhibition of KIAA0321 (Accession XM\_031077). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0321. KIAA0335 (Accession NM\_014803) is another VGAM1958 host target gene. KIAA0335 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0335 BINDING SITE, designated SEQ ID:16733, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66952] Another function of VGAM1958 is therefore inhibition of KIAA0335 (Accession NM\_014803). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0335. KIAA0349 (Accession XM\_166449) is another VGAM1958 host target gene. KIAA0349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0349 BINDING SITE, designated SEQ ID:44341, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66953] Another function of VGAM1958 is therefore inhibition of KIAA0349 (Accession XM\_166449). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0349. KIAA0390 (Accession NM\_014717) is another VGAM1958 host target gene. KIAA0390 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0390, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0390 BINDING SITE, designated SEQ ID:16270, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66954] Another function of VGAM1958 is therefore inhibition of KIAA0390 (Accession NM\_014717). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0390. KIAA0420 (Accession XM\_032693) is another VGAM1958 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31722, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66955] Another function of VGAM1958 is therefore inhibition of KIAA0420 (Accession XM\_032693). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA0430 (Accession NM\_019081) is another VGAM1958 host target gene. KIAA0430 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0430 BINDING SITE, designated SEQ ID:21151, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66956] Another function of VGAM1958 is therefore inhibition of KIAA0430 (Accession NM\_019081). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0430. KIAA0444 (Accession XM\_030999) is another VGAM1958 host target gene. KIAA0444 BINDING SITE1 through KIAA0444 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0444, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0444 BINDING SITE1 through KIAA0444 BINDING SITE4, designated SEQ ID:31239, SEQ ID:31241, SEQ ID:31243 and SEQ ID:31245 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66957] Another function of VGAM1958 is therefore inhibition of KIAA0444 (Accession XM\_030999). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0444. KIAA0493 (Accession XM\_034717) is another VGAM1958 host target gene. KIAA0493 BINDING SITE1 and KIAA0493 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0493, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE1 and KIAA0493 BINDING SITE2, designated SEQ ID:32136 and SEQ ID:32137 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66958] Another function of VGAM1958 is therefore inhibition of KIAA0493 (Accession XM\_034717). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. KIAA0515 (Accession XM\_033380) is another VGAM1958 host target gene. KIAA0515 BINDING SITE1 and KIAA0515 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0515, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA0515 BINDING SITE1 and KIAA0515 BINDING SITE2, designated SEQ ID:31916 and SEQ ID:31919 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66959] Another function of VGAM1958 is therefore inhibition of KIAA0515 (Accession XM\_033380). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA0552 (Accession NM\_014731) is another VGAM1958 host target gene. KIAA0552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0552 BINDING SITE, designated SEQ ID:16349, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66960] Another function of VGAM1958 is therefore inhibition of KIAA0552 (Accession NM\_014731). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0552. KIAA0557 (Accession XM\_085507) is another VGAM1958 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38205, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66961] Another function of VGAM1958 is therefore inhibition of KIAA0557 (Accession XM\_085507). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA0560 (Accession XM\_029045) is another VGAM1958 host target gene. KIAA0560 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0560 BINDING SITE, designated SEQ ID:30837, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[66962] Another function of VGAM1958 is therefore inhibition of KIAA0560 (Accession XM\_029045). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0560. KIAA0562 (Accession NM\_014704) is another VGAM1958 host target gene. KIAA0562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0562 BINDING SITE, designated SEQ ID:16240, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66963] Another function of VGAM1958 is therefore inhibition of KIAA0562 (Accession NM\_014704). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0562. KIAA0596 (Accession XM\_031706) is another VGAM1958 host target gene. KIAA0596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0596, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0596 BINDING SITE, designated SEQ ID:31463, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66964] Another function of VGAM1958 is therefore inhibition of KIAA0596 (Accession XM\_031706). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0596. KIAA0632 (Accession NM\_015545) is another VGAM1958 host target gene. KIAA0632 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0632 BINDING SITE, designated SEQ ID:17808, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66965] Another function of VGAM1958 is therefore inhibition of KIAA0632 (Accession NM\_015545). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0632. KIAA0638 (Accession XM\_051489) is another VGAM1958 host target gene. KIAA0638 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0638 BINDING SITE, designated SEQ ID:35845, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66966] Another function of VGAM1958 is therefore inhibition of KIAA0638 (Accession XM\_051489). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0638. KIAA0668 (Accession XM\_039332) is another VGAM1958 host target gene. KIAA0668 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0668 BINDING SITE, designated SEQ ID:33051, to the

nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66967] Another function of VGAM1958 is therefore inhibition of KIAA0668 (Accession XM\_039332). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0668. KIAA0676 (Accession NM\_015043) is another VGAM1958 host target gene. KIAA0676 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0676 BINDING SITE, designated SEQ ID:17394, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66968] Another function of VGAM1958 is therefore inhibition of KIAA0676 (Accession NM\_015043). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0676. KIAA0682 (Accession NM\_014852) is another VGAM1958 host target gene. KIAA0682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:16899, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66969] Another function of VGAM1958 is therefore inhibition of KIAA0682 (Accession NM\_014852). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682. KIAA0720 (Accession XM\_030970) is another VGAM1958 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31234, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66970] Another function of VGAM1958 is therefore inhibition of KIAA0720 (Accession XM\_030970). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0720. KIAA0729 (Accession XM\_171027) is another VGAM1958 host target gene. KIAA0729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0729 BINDING SITE, designated SEQ ID:45805, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66971] Another function of VGAM1958 is therefore inhibition of KIAA0729 (Accession XM\_171027). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0729. KIAA0759 (Accession XM\_041090) is another VGAM1958 host target gene. KIAA0759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0759 BINDING SITE, designated SEQ ID:33440, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66972] Another function of VGAM1958 is therefore inhibition of KIAA0759 (Accession XM\_041090). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0759. KIAA0767 (Accession XM\_027105) is another VGAM1958 host target gene. KIAA0767 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0767, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0767 BINDING SITE, designated SEQ ID:30408, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66973] Another function of VGAM1958 is therefore inhibition of KIAA0767 (Accession XM\_027105). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0767. KIAA0773 (Accession NM\_014690) is another VGAM1958 host target gene. KIAA0773 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0773 BINDING SITE, designated SEQ ID:16192, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66974] Another function of VGAM1958 is therefore inhibition of KIAA0773 (Accession NM\_014690). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0773. KIAA0806 (Accession NM\_014813) is another VGAM1958 host target gene. KIAA0806 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0806 BINDING SITE, designated SEQ ID:16780, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66975] Another function of VGAM1958 is therefore inhibition of

KIAA0806 (Accession NM\_014813). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0806. KIAA0819 (Accession XM\_032996) is another VGAM1958 host target gene. KIAA0819 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0819 BINDING SITE, designated SEQ ID:31809, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66976] Another function of VGAM1958 is therefore inhibition of KIAA0819 (Accession XM\_032996). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0819. KIAA0831 (Accession NM\_014924) is another VGAM1958 host target gene. KIAA0831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:17208, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66977] Another function of VGAM1958 is therefore inhibition of KIAA0831 (Accession NM\_014924). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831. KIAA0870 (Accession XM\_088315) is another VGAM1958 host target gene. KIAA0870 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0870 BINDING SITE, designated SEQ ID:39608, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66978] Another function of VGAM1958 is therefore inhibition of KIAA0870 (Accession XM\_088315). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0870. KIAA0923 (Accession NM\_014021) is another

VGAM1958 host target gene. KIAA0923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0923 BINDING SITE, designated SEQ ID:15245, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66979] Another function of VGAM1958 is therefore inhibition of KIAA0923 (Accession NM\_014021). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0923. KIAA0924 (Accession NM\_014897) is another VGAM1958 host target gene. KIAA0924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:17065, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66980] Another function of VGAM1958 is therefore inhibition of KIAA0924 (Accession NM\_014897). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. KIAA0953 (Accession XM\_039733) is another VGAM1958 host target gene. KIAA0953 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:33165, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66981] Another function of VGAM1958 is therefore inhibition of KIAA0953 (Accession XM\_039733). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953. KIAA0978 (Accession XM\_047013) is another VGAM1958 host target gene. KIAA0978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0978, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0978 BINDING SITE, designated SEQ ID:34891, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66982] Another function of VGAM1958 is therefore inhibition of KIAA0978 (Accession XM\_047013). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0978. KIAA1014 (Accession XM\_037205) is another VGAM1958 host target gene. KIAA1014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1014 BINDING SITE, designated SEQ ID:32569, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66983] Another function of VGAM1958 is therefore inhibition of KIAA1014 (Accession XM\_037205). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1014. KIAA1036 (Accession NM\_014909) is another VGAM1958 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17129, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66984] Another function of VGAM1958 is therefore inhibition of KIAA1036 (Accession NM\_014909). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. KIAA1041 (Accession NM\_014947) is another VGAM1958 host target gene. KIAA1041 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:17267, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[66985] Another function of VGAM1958 is therefore inhibition of KIAA1041 (Accession NM\_014947). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041. KIAA1045 (Accession XM\_048592) is another VGAM1958 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35192, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66986] Another function of VGAM1958 is therefore inhibition of KIAA1045 (Accession XM\_048592). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1052 (Accession NM\_014956) is another VGAM1958 host target gene. KIAA1052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1052, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1052 BINDING SITE, designated SEQ ID:17313, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66987] Another function of VGAM1958 is therefore inhibition of KIAA1052 (Accession NM\_014956). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1052. KIAA1077 (Accession XM\_053496) is another VGAM1958 host target gene. KIAA1077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1077 BINDING SITE, designated SEQ ID:36098, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66988] Another function of VGAM1958 is therefore inhibition of KIAA1077 (Accession XM\_053496). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1077. KIAA1118 (Accession XM\_045581) is another VGAM1958 host target gene. KIAA1118 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1118, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1118 BINDING SITE, designated SEQ ID:34486, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66989] Another function of VGAM1958 is therefore inhibition of KIAA1118 (Accession XM\_045581). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1118. KIAA1128 (Accession XM\_043596) is another VGAM1958 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33973, to the

nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66990] Another function of VGAM1958 is therefore inhibition of KIAA1128 (Accession XM\_043596). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128. KIAA1130 (Accession XM\_031104) is another VGAM1958 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31284, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66991] Another function of VGAM1958 is therefore inhibition of KIAA1130 (Accession XM\_031104). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. KIAA1143 (Accession XM\_044014) is another VGAM1958 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34075, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66992] Another function of VGAM1958 is therefore inhibition of KIAA1143 (Accession XM\_044014). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143. KIAA1161 (Accession XM\_088501) is another VGAM1958 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39746, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66993] Another function of VGAM1958 is therefore inhibition of KIAA1161 (Accession XM\_088501). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. KIAA1181 (Accession XM\_043340) is another VGAM1958 host target gene. KIAA1181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1181 BINDING SITE, designated SEQ ID:33923, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66994] Another function of VGAM1958 is therefore inhibition of KIAA1181 (Accession XM\_043340). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1181. KIAA1185 (Accession XM\_031399) is another VGAM1958 host target gene. KIAA1185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1185 BINDING SITE, designated SEQ ID:31370, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66995] Another function of VGAM1958 is therefore inhibition of KIAA1185 (Accession XM\_031399). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1185. KIAA1196 (Accession XM\_028968) is another VGAM1958 host target gene. KIAA1196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1196 BINDING SITE, designated SEQ ID:30818, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66996] Another function of VGAM1958 is therefore inhibition of KIAA1196 (Accession XM\_028968). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1196. KIAA1211 (Accession XM\_044178) is another VGAM1958 host target gene. KIAA1211 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1211 BINDING SITE, designated SEQ ID:34165, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66997] Another function of VGAM1958 is therefore inhibition of KIAA1211 (Accession XM\_044178). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. KIAA1228 (Accession XM\_036408) is another VGAM1958 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1228 BINDING SITE, designated SEQ ID:32439, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66998] Another function of VGAM1958 is therefore inhibition of

KIAA1228 (Accession XM\_036408). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. KIAA1277 (Accession XM\_035114) is another VGAM1958 host target gene. KIAA1277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1277 BINDING SITE, designated SEQ ID:32204, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[66999] Another function of VGAM1958 is therefore inhibition of KIAA1277 (Accession XM\_035114). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1277. KIAA1280 (Accession XM\_045766) is another VGAM1958 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34558, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67000] Another function of VGAM1958 is therefore inhibition of KIAA1280 (Accession XM\_045766). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. KIAA1322 (Accession XM\_052626) is another VGAM1958 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36032, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67001] Another function of VGAM1958 is therefore inhibition of KIAA1322 (Accession XM\_052626). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1332 (Accession XM\_048774) is another

VGAM1958 host target gene. KIAA1332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:35257, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67002] Another function of VGAM1958 is therefore inhibition of KIAA1332 (Accession XM\_048774). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332. KIAA1348 (Accession XM\_043826) is another VGAM1958 host target gene. KIAA1348 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1348, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1348 BINDING SITE, designated SEQ ID:34029, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67003] Another function of VGAM1958 is therefore inhibition of KIAA1348 (Accession XM\_043826). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1348. KIAA1432 (Accession XM\_039698) is another VGAM1958 host target gene. KIAA1432 BINDING SITE1 and KIAA1432 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1432, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE1 and KIAA1432 BINDING SITE2, designated SEQ ID:33145 and SEQ ID:33148 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67004] Another function of VGAM1958 is therefore inhibition of KIAA1432 (Accession XM\_039698). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. KIAA1493 (Accession XM\_034415) is another VGAM1958 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32086, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67005] Another function of VGAM1958 is therefore inhibition of KIAA1493 (Accession XM\_034415). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. KIAA1560 (Accession XM\_034422) is another VGAM1958 host target gene. KIAA1560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1560 BINDING SITE, designated SEQ ID:32099, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67006] Another function of VGAM1958 is therefore inhibition of KIAA1560 (Accession XM\_034422). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1560. KIAA1571 (Accession XM\_027744) is another VGAM1958 host target gene. KIAA1571 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1571 BINDING SITE, designated SEQ ID:30563, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67007] Another function of VGAM1958 is therefore inhibition of KIAA1571 (Accession XM\_027744). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1571. KIAA1576 (Accession XM\_038186) is another VGAM1958 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1576 BINDING SITE, designated SEQ ID:32771, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67008] Another function of VGAM1958 is therefore inhibition of KIAA1576 (Accession XM\_038186). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. KIAA1610 (Accession XM\_040622) is another VGAM1958 host target gene. KIAA1610 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1610 BINDING SITE, designated SEQ ID:33337, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67009] Another function of VGAM1958 is therefore inhibition of KIAA1610 (Accession XM\_040622). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1610. KIAA1656 (Accession XM\_038022) is another VGAM1958 host target gene. KIAA1656 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32733, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67010] Another function of VGAM1958 is therefore inhibition of KIAA1656 (Accession XM\_038022). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. KIAA1719 (Accession XM\_042936) is another VGAM1958 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33820, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67011] Another function of VGAM1958 is therefore inhibition of

KIAA1719 (Accession XM\_042936). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. KIAA1750 (Accession XM\_043067) is another VGAM1958 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33877, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67012] Another function of VGAM1958 is therefore inhibition of KIAA1750 (Accession XM\_043067). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. KIAA1754 (Accession XM\_032587) is another VGAM1958 host target gene. KIAA1754 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1754, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1754 BINDING SITE, designated SEQ ID:31680, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67013] Another function of VGAM1958 is therefore inhibition of KIAA1754 (Accession XM\_032587). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1754. KIAA1814 (Accession XM\_046822) is another VGAM1958 host target gene. KIAA1814 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1814 BINDING SITE, designated SEQ ID:34837, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67014] Another function of VGAM1958 is therefore inhibition of KIAA1814 (Accession XM\_046822). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1814. KIAA1821 (Accession XM\_050101) is another

VGAM1958 host target gene. KIAA1821 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1821 BINDING SITE, designated SEQ ID:35550, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67015] Another function of VGAM1958 is therefore inhibition of KIAA1821 (Accession XM\_050101). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1821. KIAA1854 (Accession XM\_049884) is another VGAM1958 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35530, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67016] Another function of VGAM1958 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. KIAA1887 (Accession XM\_084801) is another VGAM1958 host target gene. KIAA1887 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1887, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1887 BINDING SITE, designated SEQ ID:37713, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67017] Another function of VGAM1958 is therefore inhibition of KIAA1887 (Accession XM\_084801). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1887. KIAA1894 (Accession XM\_058025) is another VGAM1958 host target gene. KIAA1894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1894, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1894 BINDING SITE, designated SEQ ID:36559, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67018] Another function of VGAM1958 is therefore inhibition of KIAA1894 (Accession XM\_058025). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1894. KIAA1904 (Accession XM\_056282) is another VGAM1958 host target gene. KIAA1904 BINDING SITE1 and KIAA1904 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1904, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE1 and KIAA1904 BINDING SITE2, designated SEQ ID:36378 and SEQ ID:36379 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67019] Another function of VGAM1958 is therefore inhibition of KIAA1904 (Accession XM\_056282). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. KIAA1924 (Accession XM\_057091) is another VGAM1958 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36474, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67020] Another function of VGAM1958 is therefore inhibition of KIAA1924 (Accession XM\_057091). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. KIAA1940 (Accession XM\_086981) is another VGAM1958 host target gene. KIAA1940 BINDING SITE1 and KIAA1940 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1940, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA1940 BINDING SITE1 and KIAA1940 BINDING SITE2, designated SEQ ID:39003 and SEQ ID:39007 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67021] Another function of VGAM1958 is therefore inhibition of KIAA1940 (Accession XM\_086981). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940. KOC1 (Accession XM\_165847) is another VGAM1958 host target gene. KOC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KOC1 BINDING SITE, designated SEQ ID:43780, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67022] Another function of VGAM1958 is therefore inhibition of KOC1 (Accession XM\_165847). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KOC1.

Keratin Associated Protein 1–5 (KRTAP1–5, Accession NM\_031957) is another VGAM1958 host target gene. KRTAP1–5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KRTAP1–5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRTAP1–5 BINDING SITE, designated SEQ ID:25697, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67023] Another function of VGAM1958 is therefore inhibition of Keratin Associated Protein 1–5 (KRTAP1–5, Accession NM\_031957). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTAP1–5. I(3)mbt-like (Drosophila) (L3MBTL, Accession XM\_045421) is another VGAM1958 host target gene. L3MBTL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by L3MBTL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L3MBTL

BINDING SITE, designated SEQ ID:34456, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67024] Another function of VGAM1958 is therefore inhibition of I(3)mbt-like (Drosophila) (L3MBTL, Accession XM\_045421). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL. I(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM\_114201) is another VGAM1958 host target gene. L3MBTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by L3MBTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L3MBTL2 BINDING SITE, designated SEQ ID:42790, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67025] Another function of VGAM1958 is therefore inhibition of I(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM\_114201). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL2. Lysosomal-asso-

ciated Membrane Protein 3 (LAMP3, Accession XM\_003022) is another VGAM1958 host target gene. LAMP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMP3 BINDING SITE, designated SEQ ID:29919, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67026] Another function of VGAM1958 is therefore inhibition of Lysosomal-associated Membrane Protein 3 (LAMP3, Accession XM\_003022). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP3. LIM and SH3 Protein 1 (LASP1, Accession NM\_006148) is another VGAM1958 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE,

designated SEQ ID:12797, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67027] Another function of VGAM1958 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM\_006148). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. Leucine-rich Repeat LGI Family, Member 3 (LGI3, Accession NM\_139278) is another VGAM1958 host target gene. LGI3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LGI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI3 BINDING SITE, designated SEQ ID:29278, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67028] Another function of VGAM1958 is therefore inhibition of Leucine-rich Repeat LGI Family, Member 3 (LGI3, Accession NM\_139278). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI3. Mitogen-activated

Protein Kinase Kinase 3 (MAP2K3, Accession NM\_145109) is another VGAM1958 host target gene. MAP2K3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAP2K3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K3 BINDING SITE, designated SEQ ID:29715, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67029] Another function of VGAM1958 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 3 (MAP2K3, Accession NM\_145109). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K3. Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP3K3, Accession NM\_002401) is another VGAM1958 host target gene. MAP3K3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K3 BINDING SITE, designated SEQ

ID:8222, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67030] Another function of VGAM1958 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP3K3, Accession NM\_002401). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K3. MAWBP (Accession NM\_022129) is another VGAM1958 host target gene. MAWBP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAWBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAWBP BINDING SITE, designated SEQ ID:22680, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67031] Another function of VGAM1958 is therefore inhibition of MAWBP (Accession NM\_022129). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAWBP. MBLL39 (Accession NM\_144778) is another

VGAM1958 host target gene. MBLL39 BINDING SITE1 through MBLL39 BINDING SITE7 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MBLL39, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE1 through MBLL39 BINDING SITE7, designated SEQ ID:29568, SEQ ID:29571, SEQ ID:29572, SEQ ID:29578, SEQ ID:12317, SEQ ID:12318 and SEQ ID:12321 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67032] Another function of VGAM1958 is therefore inhibition of MBLL39 (Accession NM\_144778). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBLL39. MGC:5244 (Accession NM\_031213) is another VGAM1958 host target gene. MGC:5244 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC:5244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC:5244 BINDING SITE, designated SEQ ID:25258, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67033] Another function of VGAM1958 is therefore inhibition of MGC:5244 (Accession NM\_031213). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC:5244. MGC10765 (Accession NM\_024345) is another VGAM1958 host target gene. MGC10765 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10765 BINDING SITE, designated SEQ ID:23646, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67034] Another function of VGAM1958 is therefore inhibition of MGC10765 (Accession NM\_024345). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10765. MGC11034 (Accession NM\_031453) is another VGAM1958 host target gene. MGC11034 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC11034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11034 BINDING SITE, designated SEQ ID:25470, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67035] Another function of VGAM1958 is therefore inhibition of MGC11034 (Accession NM\_031453). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11034. MGC12335 (Accession NM\_032744) is another VGAM1958 host target gene. MGC12335 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC12335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12335 BINDING SITE, designated SEQ ID:26477, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67036] Another function of VGAM1958 is therefore inhibition of

MGC12335 (Accession NM\_032744). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12335. MGC12679 (Accession NM\_032733) is another VGAM1958 host target gene. MGC12679 BINDING SITE1 and MGC12679 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC12679, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12679 BINDING SITE1 and MGC12679 BINDING SITE2, designated SEQ ID:26457 and SEQ ID:26459 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67037] Another function of VGAM1958 is therefore inhibition of MGC12679 (Accession NM\_032733). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12679. MGC13090 (Accession NM\_032711) is another VGAM1958 host target gene. MGC13090 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13090, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13090 BINDING SITE, designated SEQ ID:26427, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67038] Another function of VGAM1958 is therefore inhibition of MGC13090 (Accession NM\_032711). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13090. MGC13170 (Accession NM\_032712) is another VGAM1958 host target gene. MGC13170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13170 BINDING SITE, designated SEQ ID:26432, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67039] Another function of VGAM1958 is therefore inhibition of MGC13170 (Accession NM\_032712). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC13170. MGC14161 (Accession NM\_032892) is another VGAM1958 host target gene. MGC14161 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14161 BINDING SITE, designated SEQ ID:26716, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67040] Another function of VGAM1958 is therefore inhibition of MGC14161 (Accession NM\_032892). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14161. MGC14407 (Accession NM\_032908) is another VGAM1958 host target gene. MGC14407 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC14407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14407 BINDING SITE, designated SEQ ID:26729, to

the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67041] Another function of VGAM1958 is therefore inhibition of MGC14407 (Accession NM\_032908). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14407. MGC15476 (Accession NM\_145056) is another VGAM1958 host target gene. MGC15476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15476 BINDING SITE, designated SEQ ID:29691, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67042] Another function of VGAM1958 is therefore inhibition of MGC15476 (Accession NM\_145056). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15476. MGC16169 (Accession NM\_033115) is another VGAM1958 host target gene. MGC16169 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by MGC16169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16169 BINDING SITE, designated SEQ ID:26963, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67043] Another function of VGAM1958 is therefore inhibition of MGC16169 (Accession NM\_033115). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16169. MGC16491 (Accession NM\_052943) is another VGAM1958 host target gene. MGC16491 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC16491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16491 BINDING SITE, designated SEQ ID:27501, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67044] Another function of VGAM1958 is therefore inhibition of MGC16491 (Accession NM\_052943). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16491. MGC1842 (Accession XM\_037797) is another VGAM1958 host target gene. MGC1842 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC1842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1842 BINDING SITE, designated SEQ ID:32685, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67045] Another function of VGAM1958 is therefore inhibition of MGC1842 (Accession XM\_037797). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1842. MGC20253 (Accession NM\_144583) is another VGAM1958 host target gene. MGC20253 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20253, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC20253 BINDING SITE, designated SEQ ID:29399, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67046] Another function of VGAM1958 is therefore inhibition of MGC20253 (Accession NM\_144583). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20253. MGC20470 (Accession NM\_145053) is another VGAM1958 host target gene. MGC20470 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20470 BINDING SITE, designated SEQ ID:29687, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67047] Another function of VGAM1958 is therefore inhibition of MGC20470 (Accession NM\_145053). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20470. MGC21854 (Accession NM\_052862) is another VGAM1958 host target gene. MGC21854 BINDING

SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by MGC21854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21854 BINDING SITE, designated SEQ ID:27447, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67048] Another function of VGAM1958 is therefore inhibition of MGC21854 (Accession NM\_052862). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21854. MGC21945 (Accession NM\_145057) is another VGAM1958 host target gene. MGC21945 BINDING SITE is HOST TARGET binding site found in the 5` un-translated region of mRNA encoded by MGC21945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21945 BINDING SITE, designated SEQ ID:29692, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67049] Another function of VGAM1958 is therefore inhibition of

MGC21945 (Accession NM\_145057). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21945. MGC22014 (Accession XM\_035307) is another VGAM1958 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32220, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67050] Another function of VGAM1958 is therefore inhibition of MGC22014 (Accession XM\_035307). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. MGC2306 (Accession NM\_032638) is another VGAM1958 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26354, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67051] Another function of VGAM1958 is therefore inhibition of MGC2306 (Accession NM\_032638). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. MGC2452 (Accession NM\_032644) is another VGAM1958 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452 BINDING SITE, designated SEQ ID:26363, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67052] Another function of VGAM1958 is therefore inhibition of MGC2452 (Accession NM\_032644). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. MGC3113 (Accession NM\_024035) is another

VGAM1958 host target gene. MGC3113 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC3113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3113 BINDING SITE, designated SEQ ID:23468, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67053] Another function of VGAM1958 is therefore inhibition of MGC3113 (Accession NM\_024035). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3113. MGC33182 (Accession XM\_062903) is another VGAM1958 host target gene. MGC33182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC33182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC33182 BINDING SITE, designated SEQ ID:37235, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67054] Another function of VGAM1958 is therefore inhibition of MGC33182 (Accession XM\_062903). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33182. MGC35558 (Accession NM\_145013) is another VGAM1958 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29613, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67055] Another function of VGAM1958 is therefore inhibition of MGC35558 (Accession NM\_145013). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. MGC4342 (Accession NM\_024329) is another VGAM1958 host target gene. MGC4342 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4342, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4342 BINDING SITE, designated SEQ ID:23626, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67056] Another function of VGAM1958 is therefore inhibition of MGC4342 (Accession NM\_024329). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4342. MGC4504 (Accession NM\_024111) is another VGAM1958 host target gene. MGC4504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4504 BINDING SITE, designated SEQ ID:23561, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67057] Another function of VGAM1958 is therefore inhibition of MGC4504 (Accession NM\_024111). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC4504. MGC4549 (Accession NM\_032377) is another VGAM1958 host target gene. MGC4549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4549 BINDING SITE, designated SEQ ID:26170, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67058] Another function of VGAM1958 is therefore inhibition of MGC4549 (Accession NM\_032377). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4549. MGC4604 (Accession NM\_031487) is another VGAM1958 host target gene. MGC4604 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4604 BINDING SITE, designated SEQ ID:25577, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM

RNA, also designated SEQ ID:4669.

[67059] Another function of VGAM1958 is therefore inhibition of MGC4604 (Accession NM\_031487). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4604. MGC4643 (Accession NM\_032715) is another VGAM1958 host target gene. MGC4643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:26444, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67060] Another function of VGAM1958 is therefore inhibition of MGC4643 (Accession NM\_032715). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643. MGC4796 (Accession XM\_029031) is another VGAM1958 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30833, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67061] Another function of VGAM1958 is therefore inhibition of MGC4796 (Accession XM\_029031). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796. MGC5601 (Accession NM\_025247) is another VGAM1958 host target gene. MGC5601 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5601 BINDING SITE, designated SEQ ID:24926, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67062] Another function of VGAM1958 is therefore inhibition of MGC5601 (Accession NM\_025247). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC5601. MIC2 Like 1 (MIC2L1, Accession NM\_031462) is another VGAM1958 host target gene. MIC2L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:25488, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67063] Another function of VGAM1958 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM\_031462). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. MIG-6 (Accession NM\_018948) is another VGAM1958 host target gene. MIG-6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIG-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG-6 BINDING SITE, designated SEQ ID:21020, to the nucleotide se-

quence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67064] Another function of VGAM1958 is therefore inhibition of MIG-6 (Accession NM\_018948). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG-6. MOST2 (Accession NM\_020250) is another VGAM1958 host target gene. MOST2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:21549, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67065] Another function of VGAM1958 is therefore inhibition of MOST2 (Accession NM\_020250). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. MST4 (Accession NM\_016542) is another VGAM1958 host target gene. MST4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by MST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MST4 BINDING SITE, designated SEQ ID:18609, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67066] Another function of VGAM1958 is therefore inhibition of MST4 (Accession NM\_016542). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MST4. MY014 (Accession NM\_030918) is another VGAM1958 host target gene. MY014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MY014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MY014 BINDING SITE, designated SEQ ID:25188, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67067] Another function of VGAM1958 is therefore inhibition of MY014 (Accession NM\_030918). Accordingly, utilities of

VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MY014. N4BP3 (Accession XM\_038920) is another VGAM1958 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32934, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67068] Another function of VGAM1958 is therefore inhibition of N4BP3 (Accession XM\_038920). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. Neuroblastoma, Suppression of Tumorigenicity 1 (NBL1, Accession XM\_001434) is another VGAM1958 host target gene. NBL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of NBL1 BINDING SITE, designated SEQ ID:29838, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67069] Another function of VGAM1958 is therefore inhibition of Neuroblastoma, Suppression of Tumorigenicity 1 (NBL1, Accession XM\_001434). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBL1. NCKX3 (Accession NM\_020689) is another VGAM1958 host target gene. NCKX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCKX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCKX3 BINDING SITE, designated SEQ ID:21840, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67070] Another function of VGAM1958 is therefore inhibition of NCKX3 (Accession NM\_020689). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCKX3. NECL1 (Accession NM\_021189) is another VGAM1958 host

target gene. NECL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NECL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NECL1 BINDING SITE, designated SEQ ID:22165, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67071] Another function of VGAM1958 is therefore inhibition of NECL1 (Accession NM\_021189). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NECL1. NIBAN (Accession NM\_022083) is another VGAM1958 host target gene. NIBAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIBAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIBAN BINDING SITE, designated SEQ ID:22627, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67072] Another function of VGAM1958 is therefore inhibition of NIBAN (Accession NM\_022083). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIBAN. NIN283 (Accession NM\_032268) is another VGAM1958 host target gene. NIN283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIN283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIN283 BINDING SITE, designated SEQ ID:26012, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67073] Another function of VGAM1958 is therefore inhibition of NIN283 (Accession NM\_032268). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIN283. Ninjurin 2 (NINJ2, Accession NM\_016533) is another VGAM1958 host target gene. NINJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NINJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NINJ2 BINDING SITE, designated SEQ ID:18604, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67074] Another function of VGAM1958 is therefore inhibition of Ninjurin 2 (NINJ2, Accession NM\_016533). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NINJ2. NIP30 (Accession NM\_024946) is another VGAM1958 host target gene. NIP30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIP30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIP30 BINDING SITE, designated SEQ ID:24499, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67075] Another function of VGAM1958 is therefore inhibition of NIP30 (Accession NM\_024946). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIP30.

NKIR (Accession NM\_139018) is another VGAM1958 host target gene. NKIR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NKIR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKIR BINDING SITE, designated SEQ ID:29117, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67076] Another function of VGAM1958 is therefore inhibition of NKIR (Accession NM\_139018). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKIR. NPD009 (Accession XM\_170795) is another VGAM1958 host target gene. NPD009 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NPD009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPD009 BINDING SITE, designated SEQ ID:45560, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4669.

[67077] Another function of VGAM1958 is therefore inhibition of NPD009 (Accession XM\_170795). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPD009. Neuronal Pentraxin Receptor (NPTXR, Accession NM\_014293) is another VGAM1958 host target gene. NPTXR BINDING SITE1 and NPTXR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NPTXR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTXR BINDING SITE1 and NPTXR BINDING SITE2, designated SEQ ID:15583 and SEQ ID:27731 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67078] Another function of VGAM1958 is therefore inhibition of Neuronal Pentraxin Receptor (NPTXR, Accession NM\_014293). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR. Nucleoredoxin (NXN, Accession NM\_022463) is another VGAM1958 host

target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22810, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67079] Another function of VGAM1958 is therefore inhibition of Nucleoredoxin (NXN, Accession NM\_022463). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN. Neurexophilin 3 (NXPH3, Accession XM\_037847) is another VGAM1958 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32713, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ

ID:4669.

[67080] Another function of VGAM1958 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM\_037847). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. NY-REN-25 (Accession XM\_027116) is another VGAM1958 host target gene. NY-REN-25 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NY-REN-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-25 BINDING SITE, designated SEQ ID:30421, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67081] Another function of VGAM1958 is therefore inhibition of NY-REN-25 (Accession XM\_027116). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-25. OCIA (Accession NM\_017830) is another VGAM1958 host target gene. OCIA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OCIA, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCIA BINDING SITE, designated SEQ ID:19492, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67082] Another function of VGAM1958 is therefore inhibition of OCIA (Accession NM\_017830). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCIA. Opiate Receptor-like 1 (OPRL1, Accession NM\_000913) is another VGAM1958 host target gene. OPRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPRL1 BINDING SITE, designated SEQ ID:6617, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67083] Another function of VGAM1958 is therefore inhibition of Opiate Receptor-like 1 (OPRL1, Accession NM\_000913). Accordingly, utilities of VGAM1958 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with OPRL1. Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM\_040635) is another VGAM1958 host target gene. P2RX1 BINDING SITE1 and P2RX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by P2RX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX1 BINDING SITE1 and P2RX1 BINDING SITE2, designated SEQ ID:33356 and SEQ ID:33357 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67084] Another function of VGAM1958 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM\_040635). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX1. Period Homolog 3 (Drosophila) (PER3, Accession NM\_016831) is another VGAM1958 host target gene. PER3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PER3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER3 BINDING SITE, designated SEQ ID:18824, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67085] Another function of VGAM1958 is therefore inhibition of Period Homolog 3 (Drosophila) (PER3, Accession NM\_016831). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER3. Protease Inhibitor 15 (PI15, Accession NM\_015886) is another VGAM1958 host target gene. PI15 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PI15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PI15 BINDING SITE, designated SEQ ID:18029, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67086] Another function of VGAM1958 is therefore inhibition of Protease Inhibitor 15 (PI15, Accession NM\_015886). Ac-

cordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PI15. PILR(ALPHA) (Accession NM\_013439) is another VGAM1958 host target gene. PILR(ALPHA) BINDING SITE1 and PILR(ALPHA) BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PILR(ALPHA), corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PILR(ALPHA) BINDING SITE1 and PILR(ALPHA) BINDING SITE2, designated SEQ ID:15101 and SEQ ID:15102 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67087] Another function of VGAM1958 is therefore inhibition of PILR(ALPHA) (Accession NM\_013439). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PILR(ALPHA). PIP3-E (Accession XM\_039749) is another VGAM1958 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33177, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67088] Another function of VGAM1958 is therefore inhibition of PIP3-E (Accession XM\_039749). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. Phosphatidylserine Decarboxylase (PISD, Accession NM\_014338) is another VGAM1958 host target gene. PISD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PISD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PISD BINDING SITE, designated SEQ ID:15653, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67089] Another function of VGAM1958 is therefore inhibition of Phosphatidylserine Decarboxylase (PISD, Accession NM\_014338). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PISD. PM5 (Accession XM\_027359) is another VGAM1958 host target gene. PM5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PM5 BINDING SITE, designated SEQ ID:30496, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67090] Another function of VGAM1958 is therefore inhibition of PM5 (Accession XM\_027359). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PM5. Paraneoplastic Antigen Like 5 (PNMA5, Accession XM\_057016) is another VGAM1958 host target gene. PNMA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PNMA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNMA5 BINDING SITE, designated SEQ ID:36442, to the nucleotide sequence of VGAM1958 RNA,

herein designated VGAM RNA, also designated SEQ ID:4669.

[67091] Another function of VGAM1958 is therefore inhibition of Paraneoplastic Antigen Like 5 (PNMA5, Accession XM\_057016). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNMA5. POLA2 (Accession NM\_002689) is another VGAM1958 host target gene. POLA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by POLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLA2 BINDING SITE, designated SEQ ID:8548, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67092] Another function of VGAM1958 is therefore inhibition of POLA2 (Accession NM\_002689). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLA2. PP2447 (Accession NM\_025204) is another VGAM1958 host target gene. PP2447 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by PP2447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP2447 BINDING SITE, designated SEQ ID:24869, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67093] Another function of VGAM1958 is therefore inhibition of PP2447 (Accession NM\_025204). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP2447. Protein Phosphatase 1A (formerly 2C), Magnesium-dependent, Alpha Isoform (PPM1A, Accession NM\_021003) is another VGAM1958 host target gene. PPM1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPM1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPM1A BINDING SITE, designated SEQ ID:21998, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67094] Another function of VGAM1958 is therefore inhibition of Protein Phosphatase 1A (formerly 2C), Magnesium-dependent, Alpha Isoform (PPM1A, Accession NM\_021003). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPM1A. Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM\_002714) is another VGAM1958 host target gene. PPP1R10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R10 BINDING SITE, designated SEQ ID:8573, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67095] Another function of VGAM1958 is therefore inhibition of Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM\_002714). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10. Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM\_086650) is another

VGAM1958 host target gene. PPP4R1L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPP4R1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP4R1L BINDING SITE, designated SEQ ID:38815, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67096] Another function of VGAM1958 is therefore inhibition of Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM\_086650). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP4R1L. PR Domain Containing 7 (PRDM7, Accession NM\_052996) is another VGAM1958 host target gene. PRDM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM7 BINDING SITE, designated SEQ ID:27568, to the nucleotide sequence of VGAM1958 RNA,

herein designated VGAM RNA, also designated SEQ ID:4669.

[67097] Another function of VGAM1958 is therefore inhibition of PR Domain Containing 7 (PRDM7, Accession NM\_052996). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM7. PRIC285 (Accession XM\_028918) is another VGAM1958 host target gene. PRIC285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRIC285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRIC285 BINDING SITE, designated SEQ ID:30805, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67098] Another function of VGAM1958 is therefore inhibition of PRIC285 (Accession XM\_028918). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRIC285. Protein Kinase, Lysine Deficient 2 (PRKWINK2, Accession XM\_117531) is another VGAM1958 host target

gene. PRKWNK2 BINDING SITE1 and PRKWNK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRKWNK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWNK2 BINDING SITE1 and PRKWNK2 BINDING SITE2, designated SEQ ID:43518 and SEQ ID:43522 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67099] Another function of VGAM1958 is therefore inhibition of Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM\_117531). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2. PRO1598 (Accession NM\_018503) is another VGAM1958 host target gene. PRO1598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1598 BINDING SITE, designated SEQ ID:20568, to the nucleotide sequence of VGAM1958

RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67100] Another function of VGAM1958 is therefore inhibition of PRO1598 (Accession NM\_018503). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1598. PRO2214 (Accession NM\_018517) is another VGAM1958 host target gene. PRO2214 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2214 BINDING SITE, designated SEQ ID:20587, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67101] Another function of VGAM1958 is therefore inhibition of PRO2214 (Accession NM\_018517). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2214. PRO2900 (Accession NM\_018635) is another VGAM1958 host target gene. PRO2900 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by PRO2900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2900 BINDING SITE, designated SEQ ID:20707, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67102] Another function of VGAM1958 is therefore inhibition of PRO2900 (Accession NM\_018635). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2900. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM\_028335) is another VGAM1958 host target gene. PRPF8 BINDING SITE1 and PRPF8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRPF8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE1 and PRPF8 BINDING SITE2, designated SEQ ID:30674 and SEQ ID:30682 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ

ID:4669.

[67103] Another function of VGAM1958 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM\_028335). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. PSR (Accession XM\_036784) is another VGAM1958 host target gene. PSR BINDING SITE1 and PSR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSR BINDING SITE1 and PSR BINDING SITE2, designated SEQ ID:32496 and SEQ ID:32499 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67104] Another function of VGAM1958 is therefore inhibition of PSR (Accession XM\_036784). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSR. PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM\_005975) is another VGAM1958 host target gene.

PTK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK6 BINDING SITE, designated SEQ ID:12595, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67105] Another function of VGAM1958 is therefore inhibition of PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM\_005975). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK6. RA-GEF-2 (Accession NM\_016340) is another VGAM1958 host target gene. RA-GEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RA-GEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RA-GEF-2 BINDING SITE, designated SEQ ID:18461, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67106] Another function of VGAM1958 is therefore inhibition of RA-GEF-2 (Accession NM\_016340). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2. RAB34, Member RAS Oncogene Family (RAB34, Accession NM\_031934) is another VGAM1958 host target gene. RAB34 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB34 BINDING SITE, designated SEQ ID:25682, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67107] Another function of VGAM1958 is therefore inhibition of RAB34, Member RAS Oncogene Family (RAB34, Accession NM\_031934). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB34. RAB3D, Member RAS Oncogene Family (RAB3D, Accession NM\_004283) is another VGAM1958 host target gene. RAB3D BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by RAB3D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3D BINDING SITE, designated SEQ ID:10496, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67108] Another function of VGAM1958 is therefore inhibition of RAB3D, Member RAS Oncogene Family (RAB3D, Accession NM\_004283). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3D. RALGPS1A (Accession NM\_014636) is another VGAM1958 host target gene. RALGPS1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALGPS1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALGPS1A BINDING SITE, designated SEQ ID:16018, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67109] Another function of VGAM1958 is therefore inhibition of

RALGPS1A (Accession NM\_014636). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALGPS1A. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM\_014737) is another VGAM1958 host target gene. RASSF2 BINDING SITE1 and RASSF2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RASSF2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE1 and RASSF2 BINDING SITE2, designated SEQ ID:16387 and SEQ ID:16395 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67110] Another function of VGAM1958 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM\_014737). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. RLUCL (Accession NM\_058192) is another VGAM1958 host target gene. RLUCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by RLUC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RLUC BINDING SITE, designated SEQ ID:27755, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67111] Another function of VGAM1958 is therefore inhibition of RLUC (Accession NM\_058192). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RLUC. Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM\_019055) is another VGAM1958 host target gene. ROBO4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROBO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO4 BINDING SITE, designated SEQ ID:21135, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67112] Another function of VGAM1958 is therefore inhibition of

Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM\_019055). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO4. SAD1 (Accession XM\_034123) is another VGAM1958 host target gene. SAD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAD1 BINDING SITE, designated SEQ ID:32009, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67113] Another function of VGAM1958 is therefore inhibition of SAD1 (Accession XM\_034123). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAD1. SAST (Accession XM\_032034) is another VGAM1958 host target gene. SAST BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SAST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SAST BINDING SITE, designated SEQ ID:31541, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67114] Another function of VGAM1958 is therefore inhibition of SAST (Accession XM\_032034). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAST. SCAMP-4 (Accession NM\_079834) is another VGAM1958 host target gene. SCAMP-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAMP-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP-4 BINDING SITE, designated SEQ ID:27821, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67115] Another function of VGAM1958 is therefore inhibition of SCAMP-4 (Accession NM\_079834). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

SCAMP-4. SCAMP5 (Accession NM\_138967) is another VGAM1958 host target gene. SCAMP5 BINDING SITE1 and SCAMP5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCAMP5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP5 BINDING SITE1 and SCAMP5 BINDING SITE2, designated SEQ ID:29076 and SEQ ID:29077 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67116] Another function of VGAM1958 is therefore inhibition of SCAMP5 (Accession NM\_138967). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP5. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM1958 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of SDC3 BINDING SITE, designated SEQ ID:16087, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67117] Another function of VGAM1958 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. SEF (Accession XM\_045300) is another VGAM1958 host target gene. SEF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEF BINDING SITE, designated SEQ ID:34427, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67118] Another function of VGAM1958 is therefore inhibition of SEF (Accession XM\_045300). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEF. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain,

(semaphorin) 4B (SEMA4B, Accession XM\_044533) is another VGAM1958 host target gene. SEMA4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4B BINDING SITE, designated SEQ ID:34226, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67119] Another function of VGAM1958 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4B (SEMA4B, Accession XM\_044533). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4B. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM\_004263) is another VGAM1958 host target gene. SEMA4F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA4F, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4F BINDING SITE, designated SEQ ID:10457, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67120] Another function of VGAM1958 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM\_004263). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4F. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM\_170638) is another VGAM1958 host target gene. SEMA4G BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA4G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4G BINDING SITE, designated SEQ ID:45412, to the nucleotide sequence of VGAM1958 RNA,

herein designated VGAM RNA, also designated SEQ ID:4669.

[67121] Another function of VGAM1958 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM\_170638). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4G. Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM\_003966) is another VGAM1958 host target gene. SEMA5A BINDING SITE1 and SEMA5A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEMA5A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA5A BINDING SITE1 and SEMA5A BINDING SITE2, designated SEQ ID:10104 and SEQ ID:10106 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67122] Another function of VGAM1958 is therefore inhibition of Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM\_003966). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA5A. SEP15 (Accession NM\_004261) is another VGAM1958 host target gene. SEP15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEP15 BINDING SITE, designated SEQ ID:10452, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67123] Another function of VGAM1958 is therefore inhibition of SEP15 (Accession NM\_004261). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEP15. Small EDRK-rich Factor 1B (centromeric) (SERF1B, Accession NM\_022978) is another VGAM1958 host target gene.

SERF1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERF1B BINDING SITE, designated SEQ ID:23260, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67124] Another function of VGAM1958 is therefore inhibition of Small EDRK-rich Factor 1B (centromeric) (SERF1B, Accession NM\_022978). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1B. Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM\_139168) is another VGAM1958 host target gene. SFRS12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SFRS12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS12 BINDING SITE, designated SEQ ID:29177, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67125] Another function of VGAM1958 is therefore inhibition of Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM\_139168). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS12. SH3 and Multiple Ankyrin Repeat Domains 3 (SHANK3, Accession XM\_037493) is another VGAM1958 host target gene. SHANK3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SHANK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHANK3 BINDING SITE, designated SEQ ID:32634, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67126] Another function of VGAM1958 is therefore inhibition of SH3 and Multiple Ankyrin Repeat Domains 3 (SHANK3, Accession XM\_037493). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHANK3. ShrmL (Accession NM\_020859) is another VGAM1958 host target

gene. ShrmL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ShrmL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ShrmL BINDING SITE, designated SEQ ID:21911, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67127] Another function of VGAM1958 is therefore inhibition of ShrmL (Accession NM\_020859). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ShrmL. Solute Carrier Family 12, (potassium–chloride transporter) Member 5 (SLC12A5, Accession NM\_020708) is another VGAM1958 host target gene. SLC12A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC12A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A5 BINDING SITE, designated SEQ ID:21852, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM

RNA, also designated SEQ ID:4669.

[67128] Another function of VGAM1958 is therefore inhibition of Solute Carrier Family 12, (potassium–chloride transporter) Member 5 (SLC12A5, Accession NM\_020708). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A5. Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM\_133489) is another VGAM1958 host target gene. SLC26A10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC26A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A10 BINDING SITE, designated SEQ ID:28562, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67129] Another function of VGAM1958 is therefore inhibition of Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM\_133489). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A10. Solute Carrier Family 38, Member 5 (SLC38A5, Accession

NM\_033518) is another VGAM1958 host target gene. SLC38A5 BINDING SITE1 and SLC38A5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC38A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A5 BINDING SITE1 and SLC38A5 BINDING SITE2, designated SEQ ID:27297 and SEQ ID:27299 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67130] Another function of VGAM1958 is therefore inhibition of Solute Carrier Family 38, Member 5 (SLC38A5, Accession NM\_033518). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A5. Synaptosomal-associated Protein, 29kDa (SNAP29, Accession NM\_004782) is another VGAM1958 host target gene. SNAP29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNAP29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SNAP29 BINDING SITE, designated SEQ ID:11188, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67131] Another function of VGAM1958 is therefore inhibition of Synaptosomal-associated Protein, 29kDa (SNAP29, Accession NM\_004782). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP29. Synaptosomal-associated Protein, 91kDa Homolog (mouse) (SNAP91, Accession NM\_014841) is another VGAM1958 host target gene. SNAP91 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNAP91, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP91 BINDING SITE, designated SEQ ID:16870, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67132] Another function of VGAM1958 is therefore inhibition of Synaptosomal-associated Protein, 91kDa Homolog (mouse) (SNAP91, Accession NM\_014841). Accordingly, utilities of VGAM1958 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SNAP91. Syntaphilin (SNPH, Accession NM\_014723) is another VGAM1958 host target gene. SNPH BINDING SITE1 and SNPH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SNPH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE1 and SNPH BINDING SITE2, designated SEQ ID:16287 and SEQ ID:16299 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67133] Another function of VGAM1958 is therefore inhibition of Syntaphilin (SNPH, Accession NM\_014723). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863) is another VGAM1958 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11282, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67134] Another function of VGAM1958 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. SSH2 (Accession XM\_030846) is another VGAM1958 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31183, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67135] Another function of VGAM1958 is therefore inhibition of SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2.

Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 2 (STAM2, Accession NM\_005843) is another VGAM1958 host target gene. STAM2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAM2 BINDING SITE, designated SEQ ID:12459, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67136] Another function of VGAM1958 is therefore inhibition of Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 2 (STAM2, Accession NM\_005843). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAM2. START Domain Containing 7 (STARD7, Accession NM\_020151) is another VGAM1958 host target gene. STARD7 BINDING SITE1 and STARD7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STARD7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of STARD7 BINDING SITE1 and STARD7 BINDING SITE2, designated SEQ ID:21359 and SEQ ID:29261 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67137] Another function of VGAM1958 is therefore inhibition of START Domain Containing 7 (STARD7, Accession NM\_020151). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7. Stromal Interaction Molecule 2 (STIM2, Accession NM\_020860) is another VGAM1958 host target gene. STIM2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIM2 BINDING SITE, designated SEQ ID:21914, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67138] Another function of VGAM1958 is therefore inhibition of Stromal Interaction Molecule 2 (STIM2, Accession NM\_020860). Accordingly, utilities of VGAM1958 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with STIM2. Stomatin (EPB72)-like 1 (STOML1, Accession NM\_004809) is another VGAM1958 host target gene. STOML1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STOML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STOML1 BINDING SITE, designated SEQ ID:11232, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67139] Another function of VGAM1958 is therefore inhibition of Stomatin (EPB72)-like 1 (STOML1, Accession NM\_004809). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STOML1. Synaptotagmin XIII (SYT13, Accession XM\_167880) is another VGAM1958 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SYT13 BINDING SITE, designated SEQ ID:44891, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67140] Another function of VGAM1958 is therefore inhibition of Synaptotagmin XIII (SYT13, Accession XM\_167880). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. TA-PP2C (Accession NM\_139283) is another VGAM1958 host target gene. TA-PP2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TA-PP2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TA-PP2C BINDING SITE, designated SEQ ID:29282, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67141] Another function of VGAM1958 is therefore inhibition of TA-PP2C (Accession NM\_139283). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-PP2C. TBC1 Domain Family, Member 2 (TBC1D2, Acces-

sion NM\_018421) is another VGAM1958 host target gene. TBC1D2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TBC1D2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBC1D2 BINDING SITE, designated SEQ ID:20468, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67142] Another function of VGAM1958 is therefore inhibition of TBC1 Domain Family, Member 2 (TBC1D2, Accession NM\_018421). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBC1D2. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_012468) is another VGAM1958 host target gene. TCL6 BINDING SITE1 through TCL6 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 through TCL6 BINDING

SITE6, designated SEQ ID:14842, SEQ ID:14844, SEQ ID:21759, SEQ ID:21768, SEQ ID:15765 and SEQ ID:15768 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67143] Another function of VGAM1958 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_012468). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. TIP-1 (Accession NM\_014604) is another VGAM1958 host target gene. TIP-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIP-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP-1 BINDING SITE, designated SEQ ID:15969, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67144] Another function of VGAM1958 is therefore inhibition of TIP-1 (Accession NM\_014604). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP-1.

Torsin Family 2, Member A (TOR2A, Accession NM\_130459) is another VGAM1958 host target gene. TOR2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOR2A BINDING SITE, designated SEQ ID:28217, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67145] Another function of VGAM1958 is therefore inhibition of Torsin Family 2, Member A (TOR2A, Accession NM\_130459). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOR2A. TNF Receptor-associated Factor 3 (TRAF3, Accession XM\_007256) is another VGAM1958 host target gene. TRAF3 BINDING SITE1 through TRAF3 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRAF3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TRAF3 BINDING SITE1 through TRAF3 BINDING SITE4, designated SEQ ID:30046, SEQ ID:30047, SEQ ID:30049 and SEQ ID:9303 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67146] Another function of VGAM1958 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM\_007256). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_033627) is another VGAM1958 host target gene. TREX1 BINDING SITE1 through TREX1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TREX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE1 through TREX1 BINDING SITE3, designated SEQ ID:27342, SEQ ID:27349 and SEQ ID:13195 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67147] Another function of VGAM1958 is therefore inhibition of

Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_033627). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. Tetratricopeptide Repeat Domain 4 (TTC4, Accession XM\_038926) is another VGAM1958 host target gene. TTC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TTC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTC4 BINDING SITE, designated SEQ ID:32958, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67148] Another function of VGAM1958 is therefore inhibition of Tetratricopeptide Repeat Domain 4 (TTC4, Accession XM\_038926). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC4. Testis-specific Transcript, Y-linked 2 (TTY2, Accession XM\_099029) is another VGAM1958 host target gene. TTY2 BINDING SITE1 and TTY2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

TTTY2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTTY2 BINDING SITE1 and TTTY2 BINDING SITE2, designated SEQ ID:42069 and SEQ ID:42073 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67149] Another function of VGAM1958 is therefore inhibition of Testis-specific Transcript, Y-linked 2 (TTTY2, Accession XM\_099029). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY2. U5-116KD (Accession NM\_004247) is another VGAM1958 host target gene. U5-116KD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by U5-116KD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of U5-116KD BINDING SITE, designated SEQ ID:10439, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67150] Another function of VGAM1958 is therefore inhibition of U5-116KD (Accession NM\_004247). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-116KD. UBAP (Accession XM\_084277) is another VGAM1958 host target gene. UBAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by UBAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBAP BINDING SITE, designated SEQ ID:37535, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67151] Another function of VGAM1958 is therefore inhibition of UBAP (Accession XM\_084277). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBAP. Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM\_013282) is another VGAM1958 host target gene. UHRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UHRF1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UHRF1 BINDING SITE, designated SEQ ID:14952, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67152] Another function of VGAM1958 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM\_013282). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF1. VI (Accession NM\_013443) is another VGAM1958 host target gene. VI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VI BINDING SITE, designated SEQ ID:15105, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67153] Another function of VGAM1958 is therefore inhibition of VI (Accession NM\_013443). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with VI. VMP1 (Accession NM\_030938) is another VGAM1958 host target gene. VMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VMP1 BINDING SITE, designated SEQ ID:25205, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67154] Another function of VGAM1958 is therefore inhibition of VMP1 (Accession NM\_030938). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VMP1. VPS39 (Accession XM\_031720) is another VGAM1958 host target gene. VPS39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS39 BINDING SITE, designated SEQ ID:31473, to the nucleotide sequence of VGAM1958 RNA,

herein designated VGAM RNA, also designated SEQ ID:4669.

[67155] Another function of VGAM1958 is therefore inhibition of VPS39 (Accession XM\_031720). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS39. WD Repeat Domain 5B (WDR5B, Accession NM\_019069) is another VGAM1958 host target gene. WDR5B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WDR5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR5B BINDING SITE, designated SEQ ID:21148, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67156] Another function of VGAM1958 is therefore inhibition of WD Repeat Domain 5B (WDR5B, Accession NM\_019069). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR5B. Zinc Finger, DHHC Domain Containing 1 (ZDHHC1, Accession XM\_085369) is another VGAM1958 host target gene. ZDHHC1 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZDHHC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC1 BINDING SITE, designated SEQ ID:38079, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67157] Another function of VGAM1958 is therefore inhibition of Zinc Finger, DHHC Domain Containing 1 (ZDHHC1, Accession XM\_085369). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC1. Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM\_016598) is another VGAM1958 host target gene. ZDHHC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZDHHC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC3 BINDING SITE, designated SEQ ID:18686, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ

ID:4669.

[67158] Another function of VGAM1958 is therefore inhibition of Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM\_016598). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC3. ZF (Accession NM\_021212) is another VGAM1958 host target gene. ZF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZF BINDING SITE, designated SEQ ID:22188, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67159] Another function of VGAM1958 is therefore inhibition of ZF (Accession NM\_021212). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF. ZFD25 (Accession NM\_016220) is another VGAM1958 host target gene. ZFD25 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZFD25, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:18323, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67160] Another function of VGAM1958 is therefore inhibition of ZFD25 (Accession NM\_016220). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25. Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM\_014569) is another VGAM1958 host target gene. ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZFP95, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP95 BINDING SITE1 and ZFP95 BINDING SITE2, designated SEQ ID:15922 and SEQ ID:29712 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67161] Another function of VGAM1958 is therefore inhibition of

Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM\_014569). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP95. Zinc Finger Protein 197 (ZNF197, Accession NM\_006991) is another VGAM1958 host target gene. ZNF197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF197 BINDING SITE, designated SEQ ID:13854, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67162] Another function of VGAM1958 is therefore inhibition of Zinc Finger Protein 197 (ZNF197, Accession NM\_006991). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF197. Zinc Finger Protein 213 (ZNF213, Accession XM\_036493) is another VGAM1958 host target gene. ZNF213 BINDING SITE1 and ZNF213 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZNF213, corre-

sponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF213 BINDING SITE1 and ZNF213 BINDING SITE2, designated SEQ ID:32462 and SEQ ID:32464 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67163] Another function of VGAM1958 is therefore inhibition of Zinc Finger Protein 213 (ZNF213, Accession XM\_036493). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF213. ZNF340 (Accession XM\_097701) is another VGAM1958 host target gene. ZNF340 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF340 BINDING SITE, designated SEQ ID:41034, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67164] Another function of VGAM1958 is therefore inhibition of

ZNF340 (Accession XM\_097701). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF340. LOC114987 (Accession NM\_145241) is another VGAM1958 host target gene. LOC114987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC114987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114987 BINDING SITE, designated SEQ ID:29755, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67165] Another function of VGAM1958 is therefore inhibition of LOC114987 (Accession NM\_145241). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114987. LOC115123 (Accession XM\_055276) is another VGAM1958 host target gene. LOC115123 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC115123 BINDING SITE, designated SEQ ID:36247, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67166] Another function of VGAM1958 is therefore inhibition of LOC115123 (Accession XM\_055276). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115123. LOC121642 (Accession XM\_058581) is another VGAM1958 host target gene. LOC121642 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC121642, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121642 BINDING SITE, designated SEQ ID:36674, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67167] Another function of VGAM1958 is therefore inhibition of LOC121642 (Accession XM\_058581). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121642. LOC122416 (Accession XM\_058615) is an-

other VGAM1958 host target gene. LOC122416 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC122416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122416 BINDING SITE, designated SEQ ID:36682, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67168] Another function of VGAM1958 is therefore inhibition of LOC122416 (Accession XM\_058615). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122416. LOC122525 (Accession XM\_071793) is another VGAM1958 host target gene. LOC122525 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC122525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122525 BINDING SITE, designated SEQ ID:37422, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67169] Another function of VGAM1958 is therefore inhibition of LOC122525 (Accession XM\_071793). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122525. LOC124044 (Accession XM\_071871) is another VGAM1958 host target gene. LOC124044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124044 BINDING SITE, designated SEQ ID:37433, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67170] Another function of VGAM1958 is therefore inhibition of LOC124044 (Accession XM\_071871). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124044. LOC124460 (Accession XM\_071892) is another VGAM1958 host target gene. LOC124460 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC124460, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124460 BINDING SITE, designated SEQ ID:37444, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67171] Another function of VGAM1958 is therefore inhibition of LOC124460 (Accession XM\_071892). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124460. LOC126917 (Accession XM\_059091) is another VGAM1958 host target gene. LOC126917 BINDING SITE1 and LOC126917 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC126917, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE1 and LOC126917 BINDING SITE2, designated SEQ ID:36866 and SEQ ID:36872 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67172] Another function of VGAM1958 is therefore inhibition of LOC126917 (Accession XM\_059091). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126917. LOC132332 (Accession XM\_072306) is another VGAM1958 host target gene. LOC132332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132332 BINDING SITE, designated SEQ ID:37487, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67173] Another function of VGAM1958 is therefore inhibition of LOC132332 (Accession XM\_072306). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132332. LOC133634 (Accession XM\_059664) is another VGAM1958 host target gene. LOC133634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC133634 BINDING SITE, designated SEQ ID:37049, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67174] Another function of VGAM1958 is therefore inhibition of LOC133634 (Accession XM\_059664). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133634. LOC135398 (Accession XM\_069333) is another VGAM1958 host target gene. LOC135398 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135398 BINDING SITE, designated SEQ ID:37386, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67175] Another function of VGAM1958 is therefore inhibition of LOC135398 (Accession XM\_069333). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135398. LOC135763 (Accession NM\_138572) is another VGAM1958 host target gene. LOC135763 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:28883, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67176] Another function of VGAM1958 is therefore inhibition of LOC135763 (Accession NM\_138572). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135763. LOC138617 (Accession XM\_070997) is another VGAM1958 host target gene. LOC138617 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138617 BINDING SITE, designated SEQ ID:37396, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67177] Another function of VGAM1958 is therefore inhibition of

LOC138617 (Accession XM\_070997). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138617. LOC142927 (Accession XM\_084380) is another VGAM1958 host target gene. LOC142927 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142927 BINDING SITE, designated SEQ ID:37565, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67178] Another function of VGAM1958 is therefore inhibition of LOC142927 (Accession XM\_084380). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142927. LOC143381 (Accession XM\_084501) is another VGAM1958 host target gene. LOC143381 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC143381 BINDING SITE, designated SEQ ID:37611, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67179] Another function of VGAM1958 is therefore inhibition of LOC143381 (Accession XM\_084501). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143381. LOC143914 (Accession XM\_084654) is another VGAM1958 host target gene. LOC143914 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143914 BINDING SITE, designated SEQ ID:37636, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67180] Another function of VGAM1958 is therefore inhibition of LOC143914 (Accession XM\_084654). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143914. LOC144305 (Accession XM\_096572) is an-

other VGAM1958 host target gene. LOC144305 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144305 BINDING SITE, designated SEQ ID:40400, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67181] Another function of VGAM1958 is therefore inhibition of LOC144305 (Accession XM\_096572). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144305. LOC144373 (Accession XM\_084841) is another VGAM1958 host target gene. LOC144373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144373 BINDING SITE, designated SEQ ID:37729, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67182] Another function of VGAM1958 is therefore inhibition of LOC144373 (Accession XM\_084841). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144373. LOC144577 (Accession XM\_084911) is another VGAM1958 host target gene. LOC144577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144577 BINDING SITE, designated SEQ ID:37768, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67183] Another function of VGAM1958 is therefore inhibition of LOC144577 (Accession XM\_084911). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144577. LOC144893 (Accession XM\_096687) is another VGAM1958 host target gene. LOC144893 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144893, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144893 BINDING SITE, designated SEQ ID:40457, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67184] Another function of VGAM1958 is therefore inhibition of LOC144893 (Accession XM\_096687). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144893. LOC145195 (Accession XM\_096731) is another VGAM1958 host target gene. LOC145195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145195 BINDING SITE, designated SEQ ID:40515, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67185] Another function of VGAM1958 is therefore inhibition of LOC145195 (Accession XM\_096731). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145195. LOC145438 (Accession XM\_096781) is another VGAM1958 host target gene. LOC145438 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145438 BINDING SITE, designated SEQ ID:40536, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67186] Another function of VGAM1958 is therefore inhibition of LOC145438 (Accession XM\_096781). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145438. LOC145608 (Accession XM\_096818) is another VGAM1958 host target gene. LOC145608 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145608 BINDING SITE, designated SEQ ID:40541, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67187] Another function of VGAM1958 is therefore inhibition of LOC145608 (Accession XM\_096818). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145608. LOC145678 (Accession XM\_096832) is another VGAM1958 host target gene. LOC145678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145678 BINDING SITE, designated SEQ ID:40552, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67188] Another function of VGAM1958 is therefore inhibition of LOC145678 (Accession XM\_096832). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145678. LOC145815 (Accession XM\_096874) is another VGAM1958 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145815, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145815 BINDING SITE, designated SEQ ID:40600, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67189] Another function of VGAM1958 is therefore inhibition of LOC145815 (Accession XM\_096874). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. LOC145820 (Accession XM\_085246) is another VGAM1958 host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:37990, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67190] Another function of VGAM1958 is therefore inhibition of LOC145820 (Accession XM\_085246). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145820. LOC145826 (Accession XM\_096875) is another VGAM1958 host target gene. LOC145826 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145826 BINDING SITE, designated SEQ ID:40609, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67191] Another function of VGAM1958 is therefore inhibition of LOC145826 (Accession XM\_096875). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145826. LOC145989 (Accession XM\_004815) is another VGAM1958 host target gene. LOC145989 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145989 BINDING SITE, designated SEQ ID:29953, to

the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67192] Another function of VGAM1958 is therefore inhibition of LOC145989 (Accession XM\_004815). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145989. LOC146050 (Accession XM\_085301) is another VGAM1958 host target gene. LOC146050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146050 BINDING SITE, designated SEQ ID:38057, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67193] Another function of VGAM1958 is therefore inhibition of LOC146050 (Accession XM\_085301). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146050. LOC146108 (Accession XM\_085322) is another VGAM1958 host target gene. LOC146108 BINDING SITE1 and LOC146108 BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by LOC146108, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146108 BINDING SITE1 and LOC146108 BINDING SITE2, designated SEQ ID:38059 and SEQ ID:38060 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67194] Another function of VGAM1958 is therefore inhibition of LOC146108 (Accession XM\_085322). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146108. LOC146445 (Accession XM\_096999) is another VGAM1958 host target gene. LOC146445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146445 BINDING SITE, designated SEQ ID:40698, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67195] Another function of VGAM1958 is therefore inhibition of LOC146445 (Accession XM\_096999). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146445. LOC146455 (Accession XM\_085471) is another VGAM1958 host target gene. LOC146455 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146455 BINDING SITE, designated SEQ ID:38158, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67196] Another function of VGAM1958 is therefore inhibition of LOC146455 (Accession XM\_085471). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455. LOC146488 (Accession XM\_047748) is another VGAM1958 host target gene. LOC146488 BINDING SITE1 through LOC146488 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC146488, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE1 through LOC146488 BINDING SITE3, designated SEQ ID:35047, SEQ ID:35048 and SEQ ID:35049 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67197] Another function of VGAM1958 is therefore inhibition of LOC146488 (Accession XM\_047748). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC146669 (Accession XM\_085534) is another VGAM1958 host target gene. LOC146669 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146669 BINDING SITE, designated SEQ ID:38225, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67198] Another function of VGAM1958 is therefore inhibition of LOC146669 (Accession XM\_085534). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146669. LOC146756 (Accession XM\_097085) is another VGAM1958 host target gene. LOC146756 BINDING SITE1 and LOC146756 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC146756, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146756 BINDING SITE1 and LOC146756 BINDING SITE2, designated SEQ ID:40735 and SEQ ID:40738 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67199] Another function of VGAM1958 is therefore inhibition of LOC146756 (Accession XM\_097085). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146756. LOC146839 (Accession XM\_097107) is another VGAM1958 host target gene. LOC146839 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146839, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146839 BINDING SITE, designated SEQ ID:40756, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67200] Another function of VGAM1958 is therefore inhibition of LOC146839 (Accession XM\_097107). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146839. LOC146990 (Accession XM\_097149) is another VGAM1958 host target gene. LOC146990 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146990 BINDING SITE, designated SEQ ID:40776, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67201] Another function of VGAM1958 is therefore inhibition of LOC146990 (Accession XM\_097149). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146990. LOC147054 (Accession XM\_097172) is another VGAM1958 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:40794, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67202] Another function of VGAM1958 is therefore inhibition of LOC147054 (Accession XM\_097172). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147054. LOC147057 (Accession XM\_097166) is another VGAM1958 host target gene. LOC147057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147057 BINDING SITE, designated SEQ ID:40784, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67203] Another function of VGAM1958 is therefore inhibition of LOC147057 (Accession XM\_097166). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147057. LOC147077 (Accession XM\_085699) is another VGAM1958 host target gene. LOC147077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147077 BINDING SITE, designated SEQ ID:38297, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67204] Another function of VGAM1958 is therefore inhibition of LOC147077 (Accession XM\_085699). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147077. LOC147136 (Accession XM\_085716) is another VGAM1958 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147136, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38305, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67205] Another function of VGAM1958 is therefore inhibition of LOC147136 (Accession XM\_085716). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC147160 (Accession XM\_097202) is another VGAM1958 host target gene. LOC147160 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147160 BINDING SITE, designated SEQ ID:40810, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67206] Another function of VGAM1958 is therefore inhibition of LOC147160 (Accession XM\_097202). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147160. LOC147353 (Accession XM\_097227) is another VGAM1958 host target gene. LOC147353 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147353 BINDING SITE, designated SEQ ID:40833, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67207] Another function of VGAM1958 is therefore inhibition of LOC147353 (Accession XM\_097227). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147353. LOC148114 (Accession XM\_086050) is another VGAM1958 host target gene. LOC148114 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148114 BINDING SITE, designated SEQ ID:38467, to

the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67208] Another function of VGAM1958 is therefore inhibition of LOC148114 (Accession XM\_086050). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148114. LOC148479 (Accession XM\_086204) is another VGAM1958 host target gene. LOC148479 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148479 BINDING SITE, designated SEQ ID:38542, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67209] Another function of VGAM1958 is therefore inhibition of LOC148479 (Accession XM\_086204). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148479. LOC148603 (Accession XM\_086247) is another VGAM1958 host target gene. LOC148603 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC148603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148603 BINDING SITE, designated SEQ ID:38568, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67210] Another function of VGAM1958 is therefore inhibition of LOC148603 (Accession XM\_086247). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148603. LOC148697 (Accession XM\_086276) is another VGAM1958 host target gene. LOC148697 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148697 BINDING SITE, designated SEQ ID:38570, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67211] Another function of VGAM1958 is therefore inhibition of LOC148697 (Accession XM\_086276). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148697. LOC148809 (Accession XM\_086325) is another VGAM1958 host target gene. LOC148809 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148809, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148809 BINDING SITE, designated SEQ ID:38592, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67212] Another function of VGAM1958 is therefore inhibition of LOC148809 (Accession XM\_086325). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148809. LOC148894 (Accession XM\_097542) is another VGAM1958 host target gene. LOC148894 BINDING SITE1 and LOC148894 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC148894, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC148894 BINDING SITE1 and LOC148894 BINDING SITE2, designated SEQ ID:40915 and SEQ ID:40918 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67213] Another function of VGAM1958 is therefore inhibition of LOC148894 (Accession XM\_097542). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148894. LOC149271 (Accession XM\_086475) is another VGAM1958 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38680, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67214] Another function of VGAM1958 is therefore inhibition of LOC149271 (Accession XM\_086475). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149271. LOC149332 (Accession XM\_097626) is another VGAM1958 host target gene. LOC149332 BINDING SITE1 and LOC149332 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC149332, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149332 BINDING SITE1 and LOC149332 BINDING SITE2, designated SEQ ID:40980 and SEQ ID:40981 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67215] Another function of VGAM1958 is therefore inhibition of LOC149332 (Accession XM\_097626). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149332. LOC149421 (Accession XM\_086528) is another VGAM1958 host target gene. LOC149421 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC149421 BINDING SITE, designated SEQ ID:38745, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67216] Another function of VGAM1958 is therefore inhibition of LOC149421 (Accession XM\_086528). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149421. LOC149501 (Accession XM\_059930) is another VGAM1958 host target gene. LOC149501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149501 BINDING SITE, designated SEQ ID:37108, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67217] Another function of VGAM1958 is therefore inhibition of LOC149501 (Accession XM\_059930). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149501. LOC149684 (Accession XM\_097710) is another VGAM1958 host target gene. LOC149684 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149684 BINDING SITE, designated SEQ ID:41047, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67218] Another function of VGAM1958 is therefore inhibition of LOC149684 (Accession XM\_097710). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149684. LOC149773 (Accession XM\_086628) is another VGAM1958 host target gene. LOC149773 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149773 BINDING SITE, designated SEQ ID:38800, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67219] Another function of VGAM1958 is therefore inhibition of

LOC149773 (Accession XM\_086628). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149773. LOC149950 (Accession XM\_086732) is another VGAM1958 host target gene. LOC149950 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149950 BINDING SITE, designated SEQ ID:38840, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67220] Another function of VGAM1958 is therefore inhibition of LOC149950 (Accession XM\_086732). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149950. LOC150135 (Accession XM\_086785) is another VGAM1958 host target gene. LOC150135 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150135 BINDING SITE, designated SEQ ID:38846, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67221] Another function of VGAM1958 is therefore inhibition of LOC150135 (Accession XM\_086785). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150135. LOC150139 (Accession XM\_086794) is another VGAM1958 host target gene. LOC150139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150139 BINDING SITE, designated SEQ ID:38857, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67222] Another function of VGAM1958 is therefore inhibition of LOC150139 (Accession XM\_086794). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150139. LOC150150 (Accession XM\_097820) is an-

other VGAM1958 host target gene. LOC150150 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150150 BINDING SITE, designated SEQ ID:41133, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67223] Another function of VGAM1958 is therefore inhibition of LOC150150 (Accession XM\_097820). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150150. LOC150157 (Accession XM\_097823) is another VGAM1958 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:41140, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67224] Another function of VGAM1958 is therefore inhibition of LOC150157 (Accession XM\_097823). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. LOC150166 (Accession XM\_097824) is another VGAM1958 host target gene. LOC150166 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150166 BINDING SITE, designated SEQ ID:41148, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67225] Another function of VGAM1958 is therefore inhibition of LOC150166 (Accession XM\_097824). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150166. LOC150406 (Accession XM\_086908) is another VGAM1958 host target gene. LOC150406 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150406, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150406 BINDING SITE, designated SEQ ID:38964, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67226] Another function of VGAM1958 is therefore inhibition of LOC150406 (Accession XM\_086908). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150406. LOC150445 (Accession XM\_086916) is another VGAM1958 host target gene. LOC150445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150445 BINDING SITE, designated SEQ ID:38971, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67227] Another function of VGAM1958 is therefore inhibition of LOC150445 (Accession XM\_086916). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150445. LOC150465 (Accession XM\_086924) is another VGAM1958 host target gene. LOC150465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150465 BINDING SITE, designated SEQ ID:38973, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67228] Another function of VGAM1958 is therefore inhibition of LOC150465 (Accession XM\_086924). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150465. LOC150568 (Accession XM\_097911) is another VGAM1958 host target gene. LOC150568 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150568 BINDING SITE, designated SEQ ID:41205, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67229] Another function of VGAM1958 is therefore inhibition of LOC150568 (Accession XM\_097911). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150568. LOC150577 (Accession XM\_097918) is another VGAM1958 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41215, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67230] Another function of VGAM1958 is therefore inhibition of LOC150577 (Accession XM\_097918). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC150587 (Accession XM\_097917) is another VGAM1958 host target gene. LOC150587 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150587, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150587 BINDING SITE, designated SEQ ID:41212, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67231] Another function of VGAM1958 is therefore inhibition of LOC150587 (Accession XM\_097917). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150587. LOC150696 (Accession NM\_144707) is another VGAM1958 host target gene. LOC150696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150696 BINDING SITE, designated SEQ ID:29529, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67232] Another function of VGAM1958 is therefore inhibition of LOC150696 (Accession NM\_144707). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150696. LOC150837 (Accession XM\_087019) is another VGAM1958 host target gene. LOC150837 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150837 BINDING SITE, designated SEQ ID:39015, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67233] Another function of VGAM1958 is therefore inhibition of LOC150837 (Accession XM\_087019). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150837. LOC150886 (Accession XM\_097963) is another VGAM1958 host target gene. LOC150886 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150886, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150886 BINDING SITE, designated SEQ ID:41268, to

the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67234] Another function of VGAM1958 is therefore inhibition of LOC150886 (Accession XM\_097963). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150886. LOC151361 (Accession XM\_098048) is another VGAM1958 host target gene. LOC151361 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151361 BINDING SITE, designated SEQ ID:41331, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67235] Another function of VGAM1958 is therefore inhibition of LOC151361 (Accession XM\_098048). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151361. LOC151438 (Accession XM\_098060) is another VGAM1958 host target gene. LOC151438 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC151438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:41349, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67236] Another function of VGAM1958 is therefore inhibition of LOC151438 (Accession XM\_098060). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151438. LOC151457 (Accession XM\_087203) is another VGAM1958 host target gene. LOC151457 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151457 BINDING SITE, designated SEQ ID:39116, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67237] Another function of VGAM1958 is therefore inhibition of LOC151457 (Accession XM\_087203). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151457. LOC151568 (Accession NM\_138483) is another VGAM1958 host target gene. LOC151568 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151568 BINDING SITE, designated SEQ ID:28838, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67238] Another function of VGAM1958 is therefore inhibition of LOC151568 (Accession NM\_138483). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151568. LOC151647 (Accession XM\_087261) is another VGAM1958 host target gene. LOC151647 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151647 BINDING SITE, designated SEQ ID:39158, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67239] Another function of VGAM1958 is therefore inhibition of LOC151647 (Accession XM\_087261). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151647. LOC152286 (Accession XM\_098188) is another VGAM1958 host target gene. LOC152286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152286 BINDING SITE, designated SEQ ID:41462, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67240] Another function of VGAM1958 is therefore inhibition of LOC152286 (Accession XM\_098188). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152286. LOC152317 (Accession XM\_098189) is another VGAM1958 host target gene. LOC152317 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152317 BINDING SITE, designated SEQ ID:41464, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67241] Another function of VGAM1958 is therefore inhibition of LOC152317 (Accession XM\_098189). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152317. LOC152343 (Accession XM\_087441) is another VGAM1958 host target gene. LOC152343 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152343 BINDING SITE, designated SEQ ID:39260, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67242] Another function of VGAM1958 is therefore inhibition of

LOC152343 (Accession XM\_087441). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152343. LOC152426 (Accession XM\_098225) is another VGAM1958 host target gene. LOC152426 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152426 BINDING SITE, designated SEQ ID:41500, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67243] Another function of VGAM1958 is therefore inhibition of LOC152426 (Accession XM\_098225). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152426. LOC152441 (Accession XM\_098230) is another VGAM1958 host target gene. LOC152441 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC152441 BINDING SITE, designated SEQ ID:41506, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67244] Another function of VGAM1958 is therefore inhibition of LOC152441 (Accession XM\_098230). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152441. LOC152453 (Accession XM\_087475) is another VGAM1958 host target gene. LOC152453 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152453 BINDING SITE, designated SEQ ID:39277, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67245] Another function of VGAM1958 is therefore inhibition of LOC152453 (Accession XM\_087475). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152453. LOC152667 (Accession XM\_087500) is an-

other VGAM1958 host target gene. LOC152667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152667 BINDING SITE, designated SEQ ID:39300, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67246] Another function of VGAM1958 is therefore inhibition of LOC152667 (Accession XM\_087500). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152667. LOC152926 (Accession XM\_087562) is another VGAM1958 host target gene. LOC152926 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152926 BINDING SITE, designated SEQ ID:39342, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67247] Another function of VGAM1958 is therefore inhibition of LOC152926 (Accession XM\_087562). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152926. LOC152992 (Accession XM\_087575) is another VGAM1958 host target gene. LOC152992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152992 BINDING SITE, designated SEQ ID:39350, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67248] Another function of VGAM1958 is therefore inhibition of LOC152992 (Accession XM\_087575). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152992. LOC153505 (Accession XM\_087693) is another VGAM1958 host target gene. LOC153505 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153505, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153505 BINDING SITE, designated SEQ ID:39381, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67249] Another function of VGAM1958 is therefore inhibition of LOC153505 (Accession XM\_087693). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153505. LOC153811 (Accession XM\_087779) is another VGAM1958 host target gene. LOC153811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:39417, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67250] Another function of VGAM1958 is therefore inhibition of LOC153811 (Accession XM\_087779). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153811. LOC153914 (Accession XM\_087799) is another VGAM1958 host target gene. LOC153914 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153914 BINDING SITE, designated SEQ ID:39434, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67251] Another function of VGAM1958 is therefore inhibition of LOC153914 (Accession XM\_087799). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153914. LOC154007 (Accession XM\_087824) is another VGAM1958 host target gene. LOC154007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154007 BINDING SITE, designated SEQ ID:39452, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67252] Another function of VGAM1958 is therefore inhibition of LOC154007 (Accession XM\_087824). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154007. LOC154222 (Accession XM\_098497) is another VGAM1958 host target gene. LOC154222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154222 BINDING SITE, designated SEQ ID:41691, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67253] Another function of VGAM1958 is therefore inhibition of LOC154222 (Accession XM\_098497). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154222. LOC154739 (Accession XM\_098602) is another VGAM1958 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154739, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41718, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67254] Another function of VGAM1958 is therefore inhibition of LOC154739 (Accession XM\_098602). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC154877 (Accession XM\_098626) is another VGAM1958 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:41741, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67255] Another function of VGAM1958 is therefore inhibition of LOC154877 (Accession XM\_098626). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC154877. LOC155006 (Accession XM\_088117) is another VGAM1958 host target gene. LOC155006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155006 BINDING SITE, designated SEQ ID:39525, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67256] Another function of VGAM1958 is therefore inhibition of LOC155006 (Accession XM\_088117). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155006. LOC155036 (Accession XM\_098651) is another VGAM1958 host target gene. LOC155036 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155036 BINDING SITE, designated SEQ ID:41754, to

the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67257] Another function of VGAM1958 is therefore inhibition of LOC155036 (Accession XM\_098651). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155036. LOC155434 (Accession XM\_098723) is another VGAM1958 host target gene. LOC155434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155434 BINDING SITE, designated SEQ ID:41772, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67258] Another function of VGAM1958 is therefore inhibition of LOC155434 (Accession XM\_098723). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155434. LOC155435 (Accession XM\_088257) is another VGAM1958 host target gene. LOC155435 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC155435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155435 BINDING SITE, designated SEQ ID:39570, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67259] Another function of VGAM1958 is therefore inhibition of LOC155435 (Accession XM\_088257). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155435. LOC157273 (Accession XM\_098743) is another VGAM1958 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41779, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67260] Another function of VGAM1958 is therefore inhibition of LOC157273 (Accession XM\_098743). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. LOC157556 (Accession XM\_098783) is another VGAM1958 host target gene. LOC157556 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157556 BINDING SITE, designated SEQ ID:41820, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67261] Another function of VGAM1958 is therefore inhibition of LOC157556 (Accession XM\_098783). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157556. LOC157623 (Accession XM\_088346) is another VGAM1958 host target gene. LOC157623 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC157623 BINDING SITE, designated SEQ ID:39616, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67262] Another function of VGAM1958 is therefore inhibition of LOC157623 (Accession XM\_088346). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157623. LOC157753 (Accession XM\_088381) is another VGAM1958 host target gene. LOC157753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157753 BINDING SITE, designated SEQ ID:39660, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67263] Another function of VGAM1958 is therefore inhibition of LOC157753 (Accession XM\_088381). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157753. LOC157860 (Accession XM\_098832) is another VGAM1958 host target gene. LOC157860 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157860 BINDING SITE, designated SEQ ID:41858, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67264] Another function of VGAM1958 is therefore inhibition of LOC157860 (Accession XM\_098832). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157860. LOC157922 (Accession XM\_098841) is another VGAM1958 host target gene. LOC157922 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157922 BINDING SITE, designated SEQ ID:41888, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67265] Another function of VGAM1958 is therefore inhibition of

LOC157922 (Accession XM\_098841). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157922. LOC157927 (Accession XM\_098848) is another VGAM1958 host target gene. LOC157927 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157927 BINDING SITE, designated SEQ ID:41907, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67266] Another function of VGAM1958 is therefore inhibition of LOC157927 (Accession XM\_098848). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157927. LOC158046 (Accession NM\_145283) is another VGAM1958 host target gene. LOC158046 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158046 BINDING SITE, designated SEQ ID:29800, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67267] Another function of VGAM1958 is therefore inhibition of LOC158046 (Accession NM\_145283). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158046. LOC158308 (Accession XM\_098917) is another VGAM1958 host target gene. LOC158308 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158308 BINDING SITE, designated SEQ ID:41940, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67268] Another function of VGAM1958 is therefore inhibition of LOC158308 (Accession XM\_098917). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158308. LOC158310 (Accession XM\_098919) is an-

other VGAM1958 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:41947, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67269] Another function of VGAM1958 is therefore inhibition of LOC158310 (Accession XM\_098919). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. LOC158427 (Accession NM\_139246) is another VGAM1958 host target gene. LOC158427 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158427 BINDING SITE, designated SEQ ID:29247, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67270] Another function of VGAM1958 is therefore inhibition of LOC158427 (Accession NM\_139246). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158427. LOC158563 (Accession XM\_088606) is another VGAM1958 host target gene. LOC158563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158563 BINDING SITE, designated SEQ ID:39870, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67271] Another function of VGAM1958 is therefore inhibition of LOC158563 (Accession XM\_088606). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563. LOC158856 (Accession XM\_098998) is another VGAM1958 host target gene. LOC158856 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158856, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158856 BINDING SITE, designated SEQ ID:42034, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67272] Another function of VGAM1958 is therefore inhibition of LOC158856 (Accession XM\_098998). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158856. LOC158969 (Accession XM\_088728) is another VGAM1958 host target gene. LOC158969 BINDING SITE1 and LOC158969 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC158969, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158969 BINDING SITE1 and LOC158969 BINDING SITE2, designated SEQ ID:39918 and SEQ ID:39920 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67273] Another function of VGAM1958 is therefore inhibition of LOC158969 (Accession XM\_088728). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158969. LOC159148 (Accession XM\_099030) is another VGAM1958 host target gene. LOC159148 BINDING SITE1 and LOC159148 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC159148, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159148 BINDING SITE1 and LOC159148 BINDING SITE2, designated SEQ ID:42080 and SEQ ID:39978 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67274] Another function of VGAM1958 is therefore inhibition of LOC159148 (Accession XM\_099030). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159148. LOC161877 (Accession XM\_091190) is another VGAM1958 host target gene. LOC161877 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161877, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161877 BINDING SITE, designated SEQ ID:40042, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67275] Another function of VGAM1958 is therefore inhibition of LOC161877 (Accession XM\_091190). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161877. LOC163412 (Accession XM\_088868) is another VGAM1958 host target gene. LOC163412 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163412 BINDING SITE, designated SEQ ID:39950, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67276] Another function of VGAM1958 is therefore inhibition of LOC163412 (Accession XM\_088868). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC163412. LOC165246 (Accession XM\_092473) is another VGAM1958 host target gene. LOC165246 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165246 BINDING SITE, designated SEQ ID:40125, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67277] Another function of VGAM1958 is therefore inhibition of LOC165246 (Accession XM\_092473). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165246. LOC169225 (Accession XM\_108531) is another VGAM1958 host target gene. LOC169225 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169225 BINDING SITE, designated SEQ ID:42204, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67278] Another function of VGAM1958 is therefore inhibition of LOC169225 (Accession XM\_108531). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169225. LOC170425 (Accession XM\_084330) is another VGAM1958 host target gene. LOC170425 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170425 BINDING SITE, designated SEQ ID:37549, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67279] Another function of VGAM1958 is therefore inhibition of LOC170425 (Accession XM\_084330). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170425. LOC196027 (Accession XM\_113633) is another VGAM1958 host target gene. LOC196027 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196027, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196027 BINDING SITE, designated SEQ ID:42307, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67280] Another function of VGAM1958 is therefore inhibition of LOC196027 (Accession XM\_113633). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196027. LOC196205 (Accession XM\_113676) is another VGAM1958 host target gene. LOC196205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196205 BINDING SITE, designated SEQ ID:42325, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67281] Another function of VGAM1958 is therefore inhibition of LOC196205 (Accession XM\_113676). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC196205. LOC196337 (Accession XM\_113696) is another VGAM1958 host target gene. LOC196337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196337 BINDING SITE, designated SEQ ID:42360, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67282] Another function of VGAM1958 is therefore inhibition of LOC196337 (Accession XM\_113696). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196337. LOC196738 (Accession XM\_113588) is another VGAM1958 host target gene. LOC196738 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196738 BINDING SITE, designated SEQ ID:42287, to

the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67283] Another function of VGAM1958 is therefore inhibition of LOC196738 (Accession XM\_113588). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196738. LOC196812 (Accession XM\_116868) is another VGAM1958 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43132, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67284] Another function of VGAM1958 is therefore inhibition of LOC196812 (Accession XM\_116868). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. LOC196955 (Accession XM\_085210) is another VGAM1958 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37929, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67285] Another function of VGAM1958 is therefore inhibition of LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC197350 (Accession XM\_113871) is another VGAM1958 host target gene. LOC197350 BINDING SITE1 and LOC197350 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC197350, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197350 BINDING SITE1 and LOC197350 BINDING SITE2, designated SEQ ID:42503 and SEQ ID:42504 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67286] Another function of VGAM1958 is therefore inhibition of LOC197350 (Accession XM\_113871). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197350. LOC199858 (Accession XM\_114040) is another VGAM1958 host target gene. LOC199858 BINDING SITE1 and LOC199858 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC199858, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE1 and LOC199858 BINDING SITE2, designated SEQ ID:42630 and SEQ ID:42631 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67287] Another function of VGAM1958 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC200325 (Accession XM\_117223) is another VGAM1958 host target gene. LOC200325 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC200325, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200325 BINDING SITE, designated SEQ ID:43289, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67288] Another function of VGAM1958 is therefore inhibition of LOC200325 (Accession XM\_117223). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200325. LOC200470 (Accession XM\_117235) is another VGAM1958 host target gene. LOC200470 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200470 BINDING SITE, designated SEQ ID:43308, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67289] Another function of VGAM1958 is therefore inhibition of LOC200470 (Accession XM\_117235). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200470. LOC200597 (Accession XM\_114266) is another VGAM1958 host target gene. LOC200597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200597 BINDING SITE, designated SEQ ID:42824, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67290] Another function of VGAM1958 is therefore inhibition of LOC200597 (Accession XM\_114266). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200597. LOC200853 (Accession XM\_114308) is another VGAM1958 host target gene. LOC200853 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200853 BINDING SITE, designated SEQ ID:42867, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67291] Another function of VGAM1958 is therefore inhibition of LOC200853 (Accession XM\_114308). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200853. LOC201191 (Accession XM\_117058) is another VGAM1958 host target gene. LOC201191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201191 BINDING SITE, designated SEQ ID:43216, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67292] Another function of VGAM1958 is therefore inhibition of LOC201191 (Accession XM\_117058). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201191. LOC201627 (Accession XM\_114353) is another VGAM1958 host target gene. LOC201627 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201627 BINDING SITE, designated SEQ ID:42895, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67293] Another function of VGAM1958 is therefore inhibition of LOC201627 (Accession XM\_114353). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201627. LOC202052 (Accession XM\_117355) is another VGAM1958 host target gene. LOC202052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202052 BINDING SITE, designated SEQ ID:43407, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67294] Another function of VGAM1958 is therefore inhibition of

LOC202052 (Accession XM\_117355). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202052. LOC202451 (Accession XM\_117401) is another VGAM1958 host target gene. LOC202451 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202451 BINDING SITE, designated SEQ ID:43439, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67295] Another function of VGAM1958 is therefore inhibition of LOC202451 (Accession XM\_117401). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202451. LOC203078 (Accession XM\_114625) is another VGAM1958 host target gene. LOC203078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC203078 BINDING SITE, designated SEQ ID:43005, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67296] Another function of VGAM1958 is therefore inhibition of LOC203078 (Accession XM\_114625). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203078. LOC203246 (Accession XM\_114658) is another VGAM1958 host target gene. LOC203246 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203246 BINDING SITE, designated SEQ ID:43015, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67297] Another function of VGAM1958 is therefore inhibition of LOC203246 (Accession XM\_114658). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203246. LOC203276 (Accession XM\_117523) is an-

other VGAM1958 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43484, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67298] Another function of VGAM1958 is therefore inhibition of LOC203276 (Accession XM\_117523). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM\_117529) is another VGAM1958 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43508, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67299] Another function of VGAM1958 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC203350 (Accession XM\_117536) is another VGAM1958 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43537, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67300] Another function of VGAM1958 is therefore inhibition of LOC203350 (Accession XM\_117536). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC203378 (Accession XM\_117541) is another VGAM1958 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43548, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67301] Another function of VGAM1958 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC204161 (Accession XM\_118480) is another VGAM1958 host target gene. LOC204161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204161 BINDING SITE, designated SEQ ID:43578, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67302] Another function of VGAM1958 is therefore inhibition of LOC204161 (Accession XM\_118480). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC204161. LOC204804 (Accession XM\_115599) is another VGAM1958 host target gene. LOC204804 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204804 BINDING SITE, designated SEQ ID:43098, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67303] Another function of VGAM1958 is therefore inhibition of LOC204804 (Accession XM\_115599). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204804. LOC204970 (Accession XM\_114795) is another VGAM1958 host target gene. LOC204970 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204970 BINDING SITE, designated SEQ ID:43070, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67304] Another function of VGAM1958 is therefore inhibition of LOC204970 (Accession XM\_114795). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204970. LOC205327 (Accession XM\_115788) is another VGAM1958 host target gene. LOC205327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC205327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205327 BINDING SITE, designated SEQ ID:43105, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67305] Another function of VGAM1958 is therefore inhibition of LOC205327 (Accession XM\_115788). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205327. LOC219404 (Accession XM\_167909) is another VGAM1958 host target gene. LOC219404 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219404, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219404 BINDING SITE, designated SEQ ID:44908, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67306] Another function of VGAM1958 is therefore inhibition of LOC219404 (Accession XM\_167909). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219404. LOC219686 (Accession XM\_165544) is another VGAM1958 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:43673, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67307] Another function of VGAM1958 is therefore inhibition of LOC219686 (Accession XM\_165544). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219686. LOC219848 (Accession XM\_166170) is another VGAM1958 host target gene. LOC219848 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219848 BINDING SITE, designated SEQ ID:43985, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67308] Another function of VGAM1958 is therefore inhibition of LOC219848 (Accession XM\_166170). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219848. LOC219942 (Accession XM\_167790) is another VGAM1958 host target gene. LOC219942 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219942 BINDING SITE, designated SEQ ID:44825, to

the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67309] Another function of VGAM1958 is therefore inhibition of LOC219942 (Accession XM\_167790). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219942. LOC220045 (Accession XM\_167820) is another VGAM1958 host target gene. LOC220045 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220045 BINDING SITE, designated SEQ ID:44861, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67310] Another function of VGAM1958 is therefore inhibition of LOC220045 (Accession XM\_167820). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220045. LOC220143 (Accession XM\_168046) is another VGAM1958 host target gene. LOC220143 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220143 BINDING SITE, designated SEQ ID:44953, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67311] Another function of VGAM1958 is therefore inhibition of LOC220143 (Accession XM\_168046). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220143. LOC220739 (Accession XM\_167548) is another VGAM1958 host target gene. LOC220739 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220739 BINDING SITE, designated SEQ ID:44657, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67312] Another function of VGAM1958 is therefore inhibition of LOC220739 (Accession XM\_167548). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220739. LOC220776 (Accession XM\_043388) is another VGAM1958 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33939, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67313] Another function of VGAM1958 is therefore inhibition of LOC220776 (Accession XM\_043388). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC220929 (Accession XM\_166134) is another VGAM1958 host target gene. LOC220929 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220929 BINDING SITE, designated SEQ ID:43928, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67314] Another function of VGAM1958 is therefore inhibition of LOC220929 (Accession XM\_166134). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220929. LOC221002 (Accession XM\_166156) is another VGAM1958 host target gene. LOC221002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221002 BINDING SITE, designated SEQ ID:43977, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67315] Another function of VGAM1958 is therefore inhibition of LOC221002 (Accession XM\_166156). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221002. LOC221042 (Accession XM\_167669) is another VGAM1958 host target gene. LOC221042 BINDING

SITE1 and LOC221042 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC221042, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE1 and LOC221042 BINDING SITE2, designated SEQ ID:44753 and SEQ ID:44754 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67316] Another function of VGAM1958 is therefore inhibition of LOC221042 (Accession XM\_167669). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221042. LOC221477 (Accession XM\_166397) is another VGAM1958 host target gene. LOC221477 BINDING SITE1 and LOC221477 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC221477, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE1 and LOC221477 BINDING SITE2, designated SEQ ID:44249

and SEQ ID:44250 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67317] Another function of VGAM1958 is therefore inhibition of LOC221477 (Accession XM\_166397). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC221687 (Accession XM\_166423) is another VGAM1958 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221687 BINDING SITE, designated SEQ ID:44304, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67318] Another function of VGAM1958 is therefore inhibition of LOC221687 (Accession XM\_166423). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. LOC221935 (Accession XM\_166537) is another VGAM1958 host target gene. LOC221935 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221935 BINDING SITE, designated SEQ ID:44503, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67319] Another function of VGAM1958 is therefore inhibition of LOC221935 (Accession XM\_166537). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221935. LOC222237 (Accession XM\_168592) is another VGAM1958 host target gene. LOC222237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222237 BINDING SITE, designated SEQ ID:45269, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67320] Another function of VGAM1958 is therefore inhibition of

LOC222237 (Accession XM\_168592). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222237. LOC253019 (Accession XM\_170907) is another VGAM1958 host target gene. LOC253019 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253019 BINDING SITE, designated SEQ ID:45669, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67321] Another function of VGAM1958 is therefore inhibition of LOC253019 (Accession XM\_170907). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253019. LOC253502 (Accession XM\_170561) is another VGAM1958 host target gene. LOC253502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC253502 BINDING SITE, designated SEQ ID:45380, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67322] Another function of VGAM1958 is therefore inhibition of LOC253502 (Accession XM\_170561). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253502. LOC253664 (Accession XM\_170673) is another VGAM1958 host target gene. LOC253664 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253664 BINDING SITE, designated SEQ ID:45450, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67323] Another function of VGAM1958 is therefore inhibition of LOC253664 (Accession XM\_170673). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253664. LOC253975 (Accession XM\_171130) is an-

other VGAM1958 host target gene. LOC253975 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253975 BINDING SITE, designated SEQ ID:45936, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67324] Another function of VGAM1958 is therefore inhibition of LOC253975 (Accession XM\_171130). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253975. LOC253981 (Accession XM\_171064) is another VGAM1958 host target gene. LOC253981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253981 BINDING SITE, designated SEQ ID:45866, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67325] Another function of VGAM1958 is therefore inhibition of LOC253981 (Accession XM\_171064). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253981. LOC254015 (Accession XM\_172977) is another VGAM1958 host target gene. LOC254015 BINDING SITE1 and LOC254015 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC254015, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254015 BINDING SITE1 and LOC254015 BINDING SITE2, designated SEQ ID:46243 and SEQ ID:46245 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67326] Another function of VGAM1958 is therefore inhibition of LOC254015 (Accession XM\_172977). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254015. LOC254243 (Accession XM\_173233) is another VGAM1958 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46510, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67327] Another function of VGAM1958 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC254531 (Accession XM\_170773) is another VGAM1958 host target gene. LOC254531 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254531 BINDING SITE, designated SEQ ID:45540, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67328] Another function of VGAM1958 is therefore inhibition of LOC254531 (Accession XM\_170773). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254531. LOC254532 (Accession XM\_172961) is another VGAM1958 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46207, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67329] Another function of VGAM1958 is therefore inhibition of LOC254532 (Accession XM\_172961). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC255057 (Accession XM\_170903) is another VGAM1958 host target gene. LOC255057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC255057 BINDING SITE, designated SEQ ID:45661, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67330] Another function of VGAM1958 is therefore inhibition of LOC255057 (Accession XM\_170903). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255057. LOC255082 (Accession XM\_172843) is another VGAM1958 host target gene. LOC255082 BINDING SITE1 and LOC255082 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC255082, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255082 BINDING SITE1 and LOC255082 BINDING SITE2, designated SEQ ID:46118 and SEQ ID:46120 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67331] Another function of VGAM1958 is therefore inhibition of LOC255082 (Accession XM\_172843). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255082. LOC255645 (Accession XM\_172967) is another VGAM1958 host target gene. LOC255645 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255645, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255645 BINDING SITE, designated SEQ ID:46222, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67332] Another function of VGAM1958 is therefore inhibition of LOC255645 (Accession XM\_172967). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255645. LOC255995 (Accession XM\_173071) is another VGAM1958 host target gene. LOC255995 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255995, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255995 BINDING SITE, designated SEQ ID:46324, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67333] Another function of VGAM1958 is therefore inhibition of LOC255995 (Accession XM\_173071). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255995. LOC256158 (Accession XM\_175125) is another VGAM1958 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46636, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67334] Another function of VGAM1958 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. LOC256790 (Accession XM\_170679) is another VGAM1958 host target gene. LOC256790 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256790, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256790 BINDING SITE, designated SEQ ID:45460, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67335] Another function of VGAM1958 is therefore inhibition of LOC256790 (Accession XM\_170679). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256790. LOC256848 (Accession XM\_174050) is another VGAM1958 host target gene. LOC256848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256848 BINDING SITE, designated SEQ ID:46570, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67336] Another function of VGAM1958 is therefore inhibition of LOC256848 (Accession XM\_174050). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC256848. LOC257054 (Accession XM\_171010) is another VGAM1958 host target gene. LOC257054 BINDING SITE1 and LOC257054 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC257054, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257054 BINDING SITE1 and LOC257054 BINDING SITE2, designated SEQ ID:45779 and SEQ ID:45784 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67337] Another function of VGAM1958 is therefore inhibition of LOC257054 (Accession XM\_171010). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257054. LOC257354 (Accession XM\_170810) is another VGAM1958 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45575, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67338] Another function of VGAM1958 is therefore inhibition of LOC257354 (Accession XM\_170810). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. LOC257451 (Accession XM\_170960) is another VGAM1958 host target gene. LOC257451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257451 BINDING SITE, designated SEQ ID:45743, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67339] Another function of VGAM1958 is therefore inhibition of LOC257451 (Accession XM\_170960). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257451. LOC257463 (Accession XM\_048605) is an-

other VGAM1958 host target gene. LOC257463 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257463 BINDING SITE, designated SEQ ID:35210, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67340] Another function of VGAM1958 is therefore inhibition of LOC257463 (Accession XM\_048605). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257463. LOC257472 (Accession XM\_170812) is another VGAM1958 host target gene. LOC257472 BINDING SITE1 and LOC257472 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC257472, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257472 BINDING SITE1 and LOC257472 BINDING SITE2, designated SEQ ID:45593 and SEQ ID:45594 respectively, to the nucleotide se-

quence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67341] Another function of VGAM1958 is therefore inhibition of LOC257472 (Accession XM\_170812). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257472. LOC51219 (Accession NM\_016418) is another VGAM1958 host target gene. LOC51219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51219 BINDING SITE, designated SEQ ID:18545, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67342] Another function of VGAM1958 is therefore inhibition of LOC51219 (Accession NM\_016418). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51219. LOC51236 (Accession NM\_016458) is another VGAM1958 host target gene. LOC51236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC51236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51236 BINDING SITE, designated SEQ ID:18571, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67343] Another function of VGAM1958 is therefore inhibition of LOC51236 (Accession NM\_016458). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51236. LOC51279 (Accession NM\_016546) is another VGAM1958 host target gene. LOC51279 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51279 BINDING SITE, designated SEQ ID:18618, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67344] Another function of VGAM1958 is therefore inhibition of LOC51279 (Accession NM\_016546). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51279. LOC51644 (Accession NM\_016057) is another VGAM1958 host target gene. LOC51644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51644 BINDING SITE, designated SEQ ID:18129, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67345] Another function of VGAM1958 is therefore inhibition of LOC51644 (Accession NM\_016057). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51644. LOC54499 (Accession XM\_047479) is another VGAM1958 host target gene. LOC54499 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC54499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC54499 BINDING SITE, designated SEQ ID:34965, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67346] Another function of VGAM1958 is therefore inhibition of LOC54499 (Accession XM\_047479). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54499. LOC55580 (Accession NM\_017571) is another VGAM1958 host target gene. LOC55580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC55580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55580 BINDING SITE, designated SEQ ID:18994, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67347] Another function of VGAM1958 is therefore inhibition of LOC55580 (Accession NM\_017571). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55580. LOC56181 (Accession XM\_170954) is another VGAM1958 host target gene. LOC56181 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56181 BINDING SITE, designated SEQ ID:45739, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67348] Another function of VGAM1958 is therefore inhibition of LOC56181 (Accession XM\_170954). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56181. LOC56270 (Accession NM\_019613) is another VGAM1958 host target gene. LOC56270 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56270, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56270 BINDING SITE, designated SEQ ID:21231, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67349] Another function of VGAM1958 is therefore inhibition of

LOC56270 (Accession NM\_019613). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56270. LOC56899 (Accession NM\_020140) is another VGAM1958 host target gene. LOC56899 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56899 BINDING SITE, designated SEQ ID:21336, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67350] Another function of VGAM1958 is therefore inhibition of LOC56899 (Accession NM\_020140). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56899. LOC57826 (Accession NM\_021183) is another VGAM1958 host target gene. LOC57826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC57826 BINDING SITE, designated SEQ ID:22158, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67351] Another function of VGAM1958 is therefore inhibition of LOC57826 (Accession NM\_021183). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57826. LOC64744 (Accession XM\_029830) is another VGAM1958 host target gene. LOC64744 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC64744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC64744 BINDING SITE, designated SEQ ID:30952, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67352] Another function of VGAM1958 is therefore inhibition of LOC64744 (Accession XM\_029830). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC64744. LOC90038 (Accession XM\_028305) is another

VGAM1958 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30647, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67353] Another function of VGAM1958 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. LOC90092 (Accession XM\_028862) is another VGAM1958 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:30781, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67354] Another function of VGAM1958 is therefore inhibition of LOC90092 (Accession XM\_028862). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90092. LOC90133 (Accession XM\_029323) is another VGAM1958 host target gene. LOC90133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90133 BINDING SITE, designated SEQ ID:30868, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67355] Another function of VGAM1958 is therefore inhibition of LOC90133 (Accession XM\_029323). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90133. LOC90148 (Accession XM\_029430) is another VGAM1958 host target gene. LOC90148 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90148, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90148 BINDING SITE, designated SEQ ID:30891, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67356] Another function of VGAM1958 is therefore inhibition of LOC90148 (Accession XM\_029430). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90148. LOC90170 (Accession XM\_029589) is another VGAM1958 host target gene. LOC90170 BINDING SITE1 and LOC90170 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC90170, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90170 BINDING SITE1 and LOC90170 BINDING SITE2, designated SEQ ID:30912 and SEQ ID:30914 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67357] Another function of VGAM1958 is therefore inhibition of LOC90170 (Accession XM\_029589). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90170. LOC90233 (Accession NM\_138347) is another VGAM1958 host target gene. LOC90233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90233 BINDING SITE, designated SEQ ID:28743, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67358] Another function of VGAM1958 is therefore inhibition of LOC90233 (Accession NM\_138347). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90233. LOC90249 (Accession XM\_030300) is another VGAM1958 host target gene. LOC90249 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90249 BINDING SITE, designated SEQ ID:31012, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67359] Another function of VGAM1958 is therefore inhibition of LOC90249 (Accession XM\_030300). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90249. LOC90288 (Accession XM\_030669) is another VGAM1958 host target gene. LOC90288 BINDING SITE1 and LOC90288 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC90288, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE1 and LOC90288 BINDING SITE2, designated SEQ ID:31109 and SEQ ID:31110 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67360] Another function of VGAM1958 is therefore inhibition of LOC90288 (Accession XM\_030669). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90288. LOC90485 (Accession XM\_032059) is another VGAM1958 host target gene. LOC90485 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90485 BINDING SITE, designated SEQ ID:31554, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67361] Another function of VGAM1958 is therefore inhibition of LOC90485 (Accession XM\_032059). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90485. LOC90632 (Accession XM\_033067) is another VGAM1958 host target gene. LOC90632 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90632 BINDING SITE, designated SEQ ID:31829, to the nucleotide sequence of VGAM1958 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4669.

[67362] Another function of VGAM1958 is therefore inhibition of LOC90632 (Accession XM\_033067). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90632. LOC90777 (Accession XM\_034052) is another VGAM1958 host target gene. LOC90777 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90777 BINDING SITE, designated SEQ ID:31993, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67363] Another function of VGAM1958 is therefore inhibition of LOC90777 (Accession XM\_034052). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90777. LOC90784 (Accession XM\_034109) is another VGAM1958 host target gene. LOC90784 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90784, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90784 BINDING SITE, designated SEQ ID:32002, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67364] Another function of VGAM1958 is therefore inhibition of LOC90784 (Accession XM\_034109). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90784. LOC90786 (Accession XM\_034127) is another VGAM1958 host target gene. LOC90786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90786 BINDING SITE, designated SEQ ID:32011, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67365] Another function of VGAM1958 is therefore inhibition of LOC90786 (Accession XM\_034127). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC90786. LOC90826 (Accession XM\_034321) is another VGAM1958 host target gene. LOC90826 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90826 BINDING SITE, designated SEQ ID:32053, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67366] Another function of VGAM1958 is therefore inhibition of LOC90826 (Accession XM\_034321). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90826. LOC90906 (Accession XM\_034809) is another VGAM1958 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32147, to the

nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67367] Another function of VGAM1958 is therefore inhibition of LOC90906 (Accession XM\_034809). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. LOC91050 (Accession XM\_035703) is another VGAM1958 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32333, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67368] Another function of VGAM1958 is therefore inhibition of LOC91050 (Accession XM\_035703). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. LOC91097 (Accession XM\_035977) is another VGAM1958 host target gene. LOC91097 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC91097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91097 BINDING SITE, designated SEQ ID:32369, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67369] Another function of VGAM1958 is therefore inhibition of LOC91097 (Accession XM\_035977). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91097. LOC91149 (Accession XM\_036480) is another VGAM1958 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32453, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67370] Another function of VGAM1958 is therefore inhibition of LOC91149 (Accession XM\_036480). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149. LOC91301 (Accession XM\_037564) is another VGAM1958 host target gene. LOC91301 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91301 BINDING SITE, designated SEQ ID:32650, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67371] Another function of VGAM1958 is therefore inhibition of LOC91301 (Accession XM\_037564). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91301. LOC91355 (Accession XM\_037825) is another VGAM1958 host target gene. LOC91355 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91355 BINDING SITE, designated SEQ ID:32701, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67372] Another function of VGAM1958 is therefore inhibition of LOC91355 (Accession XM\_037825). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91355. LOC91445 (Accession XM\_018516) is another VGAM1958 host target gene. LOC91445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91445 BINDING SITE, designated SEQ ID:30365, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67373] Another function of VGAM1958 is therefore inhibition of LOC91445 (Accession XM\_018516). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91445. LOC91531 (Accession XM\_038998) is another VGAM1958 host target gene. LOC91531 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91531 BINDING SITE, designated SEQ ID:32972, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67374] Another function of VGAM1958 is therefore inhibition of LOC91531 (Accession XM\_038998). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91531. LOC91632 (Accession XM\_039721) is another VGAM1958 host target gene. LOC91632 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91632 BINDING SITE, designated SEQ ID:33164, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67375] Another function of VGAM1958 is therefore inhibition of

LOC91632 (Accession XM\_039721). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91632. LOC91759 (Accession XM\_040467) is another VGAM1958 host target gene. LOC91759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91759 BINDING SITE, designated SEQ ID:33300, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67376] Another function of VGAM1958 is therefore inhibition of LOC91759 (Accession XM\_040467). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91759. LOC91812 (Accession XM\_040857) is another VGAM1958 host target gene. LOC91812 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC91812 BINDING SITE, designated SEQ ID:33391, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67377] Another function of VGAM1958 is therefore inhibition of LOC91812 (Accession XM\_040857). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91812. LOC91813 (Accession XM\_040862) is another VGAM1958 host target gene. LOC91813 BINDING SITE1 and LOC91813 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91813, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91813 BINDING SITE1 and LOC91813 BINDING SITE2, designated SEQ ID:33394 and SEQ ID:33399 respectively, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67378] Another function of VGAM1958 is therefore inhibition of LOC91813 (Accession XM\_040862). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91813. LOC92249 (Accession XM\_043814) is another VGAM1958 host target gene. LOC92249 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:34018, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67379] Another function of VGAM1958 is therefore inhibition of LOC92249 (Accession XM\_043814). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. LOC92360 (Accession XM\_044589) is another VGAM1958 host target gene. LOC92360 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92360 BINDING SITE, designated SEQ ID:34240, to the

nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67380] Another function of VGAM1958 is therefore inhibition of LOC92360 (Accession XM\_044589). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92360. LOC92492 (Accession XM\_045396) is another VGAM1958 host target gene. LOC92492 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92492 BINDING SITE, designated SEQ ID:34453, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67381] Another function of VGAM1958 is therefore inhibition of LOC92492 (Accession XM\_045396). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92492. LOC92499 (Accession XM\_045450) is another VGAM1958 host target gene. LOC92499 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC92499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92499 BINDING SITE, designated SEQ ID:34462, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67382] Another function of VGAM1958 is therefore inhibition of LOC92499 (Accession XM\_045450). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92499. LOC92973 (Accession XM\_048529) is another VGAM1958 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35186, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67383] Another function of VGAM1958 is therefore inhibition of LOC92973 (Accession XM\_048529). Accordingly, utilities

of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. LOC93017 (Accession XM\_048772) is another VGAM1958 host target gene. LOC93017 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93017 BINDING SITE, designated SEQ ID:35252, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67384] Another function of VGAM1958 is therefore inhibition of LOC93017 (Accession XM\_048772). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93017. LOC93052 (Accession XM\_048905) is another VGAM1958 host target gene. LOC93052 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC93052 BINDING SITE, designated SEQ ID:35303, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67385] Another function of VGAM1958 is therefore inhibition of LOC93052 (Accession XM\_048905). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93052. LOC93613 (Accession XM\_052568) is another VGAM1958 host target gene. LOC93613 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93613 BINDING SITE, designated SEQ ID:35996, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67386] Another function of VGAM1958 is therefore inhibition of LOC93613 (Accession XM\_052568). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93613. LOC96597 (Accession XM\_039922) is another VGAM1958 host target gene. LOC96597 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC96597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:33226, to the nucleotide sequence of VGAM1958 RNA, herein designated VGAM RNA, also designated SEQ ID:4669.

[67387] Another function of VGAM1958 is therefore inhibition of LOC96597 (Accession XM\_039922). Accordingly, utilities of VGAM1958 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1959 (VGAM1959) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[67388] VGAM1959 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1959 was detected is described hereinabove with reference to Figs. 1-8.

[67389] VGAM1959 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1959 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[67390] VGAM1959 gene encodes a VGAM1959 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1959 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1959 precursor RNA is designated SEQ ID:1945, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1945 is located at position 16300 relative to the genome of Macaca Mulatta Rhadinovirus.

[67391] VGAM1959 precursor RNA folds onto itself, forming VGAM1959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[67392] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1959 folded precursor RNA into VGAM1959 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1959 RNA is designated SEQ ID:4670, and is provided hereinbelow with reference to the sequence listing part.

[67393] VGAM1959 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1959 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1959 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[67394] VGAM1959 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1959 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1959 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1959 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1959 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[67395] The complementary binding of VGAM1959 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1959 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1959 host target RNA into VGAM1959 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[67396] It is appreciated that VGAM1959 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1959 host target genes. The mRNA of each one of this plurality of VGAM1959 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1959 RNA, herein designated VGAM RNA, and which when bound by VGAM1959 RNA causes inhibition of translation of respective one or more VGAM1959 host target proteins.

[67397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1959 gene, herein designated VGAM GENE, on one or more VGAM1959 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[67398] It is yet further appreciated that a function of VGAM1959 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1959 correlate with, and may be deduced from, the identity of the host target genes which VGAM1959 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[67399] Nucleotide sequences of the VGAM1959 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1959 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1959 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1959 are further described hereinbelow with reference to Table 1.

[67400] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1959 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1959 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[67401] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1959 gene, herein designated VGAM is inhibition of expression of VGAM1959 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1959 correlate with, and may be deduced from, the identity of the target genes which VGAM1959 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[67402] Amiloride-sensitive Cation Channel 2, Neuronal (ACCN2, Accession NM\_020039) is a VGAM1959 host target gene. ACCN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ACCN2 BINDING SITE, designated SEQ ID:21298, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67403] A function of VGAM1959 is therefore inhibition of Amiloride-sensitive Cation Channel 2, Neuronal (ACCN2, Accession NM\_020039). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACCN2. ACK1 (Accession NM\_005781) is another VGAM1959 host target gene. ACK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACK1 BINDING SITE, designated SEQ ID:12359, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67404] Another function of VGAM1959 is therefore inhibition of ACK1 (Accession NM\_005781). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ACK1. A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM\_033274) is another VGAM1959 host target gene. ADAM19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM19 BINDING SITE, designated SEQ ID:27096, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67405] Another function of VGAM1959 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM\_033274), a gene which participates in the proteolytic processing of beta-type neuregulin isoforms. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM19. The function of ADAM19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. A Disintegrin-like and Metalloprotease

(reprolysin type) with Thrombospondin Type 1 Motif, 13 (ADAMTS13, Accession NM\_139028) is another VGAM1959 host target gene. ADAMTS13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS13 BINDING SITE, designated SEQ ID:29129, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67406] Another function of VGAM1959 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 13 (ADAMTS13, Accession NM\_139028), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS13. The function of ADAMTS13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Adenylate Cyclase 6 (ADCY6, Accession

NM\_020983) is another VGAM1959 host target gene. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADCY6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:21978 and SEQ ID:17591 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67407] Another function of VGAM1959 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM\_020983), a gene which this a membrane-bound,  $Ca^{2+}$ -inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6. The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM22. Adducin 2 (beta) (ADD2, Accession NM\_017483) is another VGAM1959 host target gene. ADD2 BINDING SITE1 through ADD2 BINDING SITE7 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADD2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE1 through ADD2 BINDING SITE7, designated SEQ ID:18936, SEQ ID:18939, SEQ ID:18941, SEQ ID:18944, SEQ ID:18947, SEQ ID:18949 and SEQ ID:6793 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67408] Another function of VGAM1959 is therefore inhibition of Adducin 2 (beta) (ADD2, Accession NM\_017483), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD2. The function of ADD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1185.1-acylglycerol-3-phosphate O-acyltransferase 2 (lysophosphatidic acid acyltransferase, beta) (AGPAT2, Accession XM\_038030) is another VGAM1959 host target gene. AGPAT2 BINDING SITE1 and

AGPAT2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGPAT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT2 BINDING SITE1 and AGPAT2 BINDING SITE2, designated SEQ ID:32746 and SEQ ID:13119 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67409] Another function of VGAM1959 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 2 (lysophosphatidic acid acyltransferase, beta) (AGPAT2, Accession XM\_038030). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGPAT2. A Kinase (PRKA) Anchor Protein 1 (AKAP1, Accession NM\_003488) is another VGAM1959 host target gene. AKAP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AKAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

AKAP1 BINDING SITE, designated SEQ ID:9580, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67410] Another function of VGAM1959 is therefore inhibition of A Kinase (PRKA) Anchor Protein 1 (AKAP1, Accession NM\_003488), a gene which binds to type i and ii regulatory subunits of protein kinase a . Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP1. The function of AKAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1392. Anaplastic Lymphoma Kinase (Ki-1) (ALK, Accession XM\_055726) is another VGAM1959 host target gene. ALK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ALK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALK BINDING SITE, designated SEQ ID:36320, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67411] Another function of VGAM1959 is therefore inhibition of

Anaplastic Lymphoma Kinase (Ki-1) (ALK, Accession XM\_055726). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALK. Autocrine Motility Factor Receptor (AMFR, Accession NM\_138958) is another VGAM1959 host target gene. AMFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMFR BINDING SITE, designated SEQ ID:29065, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67412] Another function of VGAM1959 is therefore inhibition of Autocrine Motility Factor Receptor (AMFR, Accession NM\_138958), a gene which acts to stimulate migration of fibrosarcoma cells. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMFR. The function of AMFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM440. Ankyrin 1, Erythrocytic (ANK1, Accession NM\_020476) is another VGAM1959 host target gene. ANK1 BINDING SITE1 through ANK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE1 through ANK1 BINDING SITE3, designated SEQ ID:21731, SEQ ID:30282 and SEQ ID:5478 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67413] Another function of VGAM1959 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession NM\_020476). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. Apolipoprotein L, 1 (APOL1, Accession NM\_003661) is another VGAM1959 host target gene. APOL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of APOL1 BINDING SITE, designated SEQ ID:9734, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67414] Another function of VGAM1959 is therefore inhibition of Apolipoprotein L, 1 (APOL1, Accession NM\_003661), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL1. The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM235. Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174) is another VGAM1959 host target gene. ARHGAP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE, designated SEQ ID:6849, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4670.

[67415] Another function of VGAM1959 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM\_001678) is another VGAM1959 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7395, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67416] Another function of VGAM1959 is therefore inhibition of

ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM\_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na<sup>+</sup>/K<sup>+</sup> ions across the plasma membrane. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. ATPase, Ca<sup>++</sup> Transporting, Ubiquitous (ATP2A3, Accession NM\_005173) is another VGAM1959 host target gene. ATP2A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP2A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A3 BINDING SITE, designated SEQ ID:11674, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67417] Another function of VGAM1959 is therefore inhibition of ATPase, Ca<sup>++</sup> Transporting, Ubiquitous (ATP2A3, Accession NM\_005173). Accordingly, utilities of VGAM1959 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A3. ATPase, Cu<sup>++</sup> Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053) is another VGAM1959 host target gene. ATP7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7B BINDING SITE, designated SEQ ID:5510, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67418] Another function of VGAM1959 is therefore inhibition of ATPase, Cu<sup>++</sup> Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7B. ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM\_036933) is another VGAM1959 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32512, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67419] Another function of VGAM1959 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM\_036933). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM\_001706) is another VGAM1959 host target gene. BCL6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE, designated SEQ ID:7429, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67420] Another function of VGAM1959 is therefore inhibition of B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Ac-

cession NM\_001706), a gene which is involved in the generation and maintenance of both T and B cells during immune responses. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL6. The function of BCL6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481. B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993) is another VGAM1959 host target gene. BCL7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21992, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67421] Another function of VGAM1959 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7A. BCRP2 (Accession

XM\_031102) is another VGAM1959 host target gene.

BCRP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCRP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCRP2 BINDING SITE, designated SEQ ID:31273, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67422] Another function of VGAM1959 is therefore inhibition of BCRP2 (Accession XM\_031102). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCRP2. BLAME (Accession NM\_020125) is another VGAM1959 host target gene. BLAME BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:21308, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4670.

[67423] Another function of VGAM1959 is therefore inhibition of BLAME (Accession NM\_020125). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLAME. Basonuclin (BNC, Accession NM\_001717) is another VGAM1959 host target gene. BNC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BNC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BNC BINDING SITE, designated SEQ ID:7451, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67424] Another function of VGAM1959 is therefore inhibition of Basonuclin (BNC, Accession NM\_001717), a gene which plays a role in the maintenance of proliferative capacity and prevention of terminal differentiation of keratinocytes. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNC. The function of BNC and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM1514.BTG Family, Member 2 (BTG2, Accession NM\_006763) is another VGAM1959 host target gene. BTG2 BINDING SITE1 and BTG2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BTG2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE1 and BTG2 BINDING SITE2, designated SEQ ID:13623 and SEQ ID:13624 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67425] Another function of VGAM1959 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM\_006763). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Caspase 10, Apoptosis-related Cysteine Protease (CASP10, Accession NM\_032976) is another VGAM1959 host target gene. CASP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP10 BINDING SITE, designated SEQ ID:26834, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67426] Another function of VGAM1959 is therefore inhibition of Caspase 10, Apoptosis-related Cysteine Protease (CASP10, Accession NM\_032976), a gene which is one aspartate-specific cysteine protease and important in death receptor signaling or other cellular processes. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP10. The function of CASP10 has been established by previous studies. Wang et al. (2001) showed that caspase-10 can function independently of caspase-8 in initiating FAS- and tumor necrosis factor-related apoptosis-inducing ligand-receptor-mediated apoptosis. Moreover, FAS crosslinking in primary human T cells leads to the recruitment and activation of caspase-10. They showed that the death-effector domains of caspases 8 and 10 interact with the death-effector domain of FADD. Nonetheless, they found that caspases 8 and 10 may have different apoptosis substrates and therefore potentially

distinct roles in death receptor signaling or other cellular processes. By a candidate gene mutation search strategy, Wang et al. (1999) identified independent missense mutations in the CASP10 gene in 2 kindreds with type II autoimmune lymphoproliferative syndrome (ALPS2; 603909) characterized by abnormal lymphocyte and dendritic cell homeostasis and immune regulatory defects. The mutations (601762.0001 and 601762.0002) resulted in amino acid substitutions that decreased caspase activity and interfered with death receptor-induced apoptosis, particularly that stimulated by Fas ligand (OMIM Ref. No. 134638) and TRAIL (OMIM Ref. No. 603598). These results provided evidence that inherited nonlethal caspase abnormalities cause pleiotropic apoptosis defects underlying autoimmunity in ALPS2. To explore the possibility that mutation in the CASP10 gene might be involved in the development of non-Hodgkin lymphoma (NHL; 605027), Shin et al. (2002) analyzed the entire coding region and all splice sites of the CASP10 gene for the detection of somatic mutations in 117 human NHLs. Seventeen NHLs (14.5%) had CASP10 mutations, of which 3 were identified in the coding regions of the prodomain, 11 in the p17 large protease subunit, and 3 in the p12 small protease

subunit. There were 2 frameshift mutations and 1 non-sense mutation; the remaining 14 were missense mutations. Shin et al. (2002) expressed the tumor-derived CASP10 mutants in 293 cells and found that apoptosis was suppressed. These data suggested that the inactivating mutations of the CASP10 gene may lead to the loss of its apoptotic function and contribute to the pathogenesis of some human NHLs.

[67427] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67428] Wang, J.; Chun, H. J.; Wong, W.; Spencer, D. M.; Lenardo, M. J. : Caspase-10 is an initiator caspase in death receptor signaling. *Proc. Nat. Acad. Sci.* 98: 13884-13888, 2001. ; and

[67429] Wang, J.; Zheng, L.; Lobito, A.; Chan, F. K.; Dale, J.; Sneller, M.; Yao, X.; Puck, J. M.; Straus, S. E.; Lenardo, M. J. : Inherited human caspase 10 mutations underlie defective lympho.

[67430] Further studies establishing the function and utilities of CASP10 are found in John Hopkins OMIM database record ID 601762, and in cited publications numbered 7119-6717 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Cyclin F (CCNF, Accession NM\_001761) is another VGAM1959 host target gene. CCNF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNF BINDING SITE, designated SEQ ID:7526, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67431] Another function of VGAM1959 is therefore inhibition of Cyclin F (CCNF, Accession NM\_001761), a gene which likely to be involved in the control of the cell cycle during S phase and G2. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNF. The function of CCNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM367. Cadherin 5, Type 2, VE-cadherin (vascular epithelium) (CDH5, Accession NM\_001795) is another VGAM1959 host target gene. CDH5 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH5 BINDING SITE, designated SEQ ID:7549, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67432] Another function of VGAM1959 is therefore inhibition of Cadherin 5, Type 2, VE-cadherin (vascular epithelium) (CDH5, Accession NM\_001795), a gene which associates with alpha-catenin forming a link to the cytoskeleton. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH5. The function of CDH5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1342. Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM\_052988) is another VGAM1959 host target gene. CDK10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDK10, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK10 BINDING SITE, designated SEQ ID:27556, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67433] Another function of VGAM1959 is therefore inhibition of Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM\_052988), a gene which plays a pivotal role in the regulation of the eukaryotic cell cycle. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK10. The function of CDK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Cerebellar Degeneration-related Protein 2, 62kDa (CDR2, Accession XM\_071866) is another VGAM1959 host target gene. CDR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDR2 BINDING SITE, designated SEQ ID:37428, to the nucleotide se-

quence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67434] Another function of VGAM1959 is therefore inhibition of Cerebellar Degeneration-related Protein 2, 62kDa (CDR2, Accession XM\_071866), a gene which plays a role in cytokinesis, cell shape, and functions such as secretion and capping. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDR2. The function of CDR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM\_001712) is another VGAM1959 host target gene. CEACAM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM1 BINDING SITE, designated SEQ ID:7441, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ

ID:4670.

[67435] Another function of VGAM1959 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM\_001712), a gene which is a major effector of VEGF and may be a target for the inhibition of tumor angiogenesis. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM1. The function of CEACAM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93.Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM\_001407) is another VGAM1959 host target gene. CELSR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR3 BINDING SITE, designated SEQ ID:7103, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ

ID:4670.

[67436] Another function of VGAM1959 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM\_001407), a gene which interacts in a homophilic manner in connecting cells. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR3. The function of CELSR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM893. Centrosomal Protein 2 (CEP2, Accession NM\_007186) is another VGAM1959 host target gene. CEP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP2 BINDING SITE, designated SEQ ID:14043, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67437] Another function of VGAM1959 is therefore inhibition of Centrosomal Protein 2 (CEP2, Accession NM\_007186), a

gene which interacts with TC10 and CDC42. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP2. The function of CEP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. Chorionic Gonadotropin, Beta Polypeptide (CGB, Accession NM\_000737) is another VGAM1959 host target gene. CGB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB BINDING SITE, designated SEQ ID:6394, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67438] Another function of VGAM1959 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide (CGB, Accession NM\_000737), a gene which stimulates the ovaries to synthesize the steroids. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB. The function

of CGB has been established by previous studies. Human chorionic gonadotropin (hCG) is a glycoprotein hormone produced by trophoblastic cells of the placenta beginning 10 to 12 days after conception. Maintenance of the fetus in the first trimester of pregnancy requires the production of hCG, which binds to the corpus luteum of the ovary which is stimulated to produce progesterone which in turn maintains the secretory endometrium. See 118850.

Boorstein et al. (1982) concluded that the beta subunit of CG is encoded by at least 8 genes arranged in tandem and inverted pairs. They stated that 'until sequence analysis is complete, we cannot exclude the possibility that the eight genes include some pseudogenes or the related gene, beta-LH.' The beta subunits of luteinizing hormone (LHB) and CG show about 82% amino acid homology. The homology with beta-FSH and beta-TSH is much lower. Policastro et al. (1983, 1986) found 6 nonallelic copies of the CGB gene and a single-copy LHB gene. All were contained in a single 58-kb EcoRI fragment. The hCG beta-subunit is unique in the family of beta-containing glycoprotein hormones in that it contains an extension of 29 amino acids at its COOH end. Amato et al. (2002) reported a patient with a 9-year history of secondary infertility due to

an anti-CG autoantibody. Although she had regular menstrual cycles, had conceived spontaneously, and had good hormonal and follicular responses to gonadotropic stimulation regimens during the in vitro fertilization workup, she presented with apparent recurrent pregnancy loss associated with prolonged raised CG levels. She was found to have specific, low-affinity, but high-capacity anti-CG antibody. Crossreaction with recombinant FSH, recombinant LH, CG-alpha, and CG-beta was low. In addition, heat-inactivated serum and the affinity-purified IgG were shown to inhibit the action of CG in an in vitro bioassay. The authors concluded that the persisting titer of the antibody was responsible for the patient's infertility.

[67439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67440] Policastro, P. F.; Daniels-McQueen, S.; Carle, G.; Boime, I. : A map of the hCG-beta-LH-beta gene cluster. J. Biol. Chem. 261: 5907-5916, 1986. ; and

[67441] Amato, F.; Warnes, G. M.; Kirby, C. A.; Norman, R. J. : Infertility caused by hCG autoantibody. J. Clin. Endocr. Metab. 87: 993-997, 2002.

[67442] Further studies establishing the function and utilities of

CGB are found in John Hopkins OMIM database record ID 118860, and in cited publications numbered 12221, 12289–12294, 10886, 1222 and 12295–12298 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CGTHBA (Accession NM\_012075) is another VGAM1959 host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14356, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67443] Another function of VGAM1959 is therefore inhibition of CGTHBA (Accession NM\_012075). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM\_001271) is another VGAM1959 host target gene. CHD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by CHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHD2 BINDING SITE, designated SEQ ID:6938, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67444] Another function of VGAM1959 is therefore inhibition of Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM\_001271). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHD2. Cholinergic Receptor, Nicotinic, Epsilon Polypeptide (CHRNE, Accession NM\_000080) is another VGAM1959 host target gene. CHRNE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRNE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNE BINDING SITE, designated SEQ ID:5522, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67445] Another function of VGAM1959 is therefore inhibition of Cholinergic Receptor, Nicotinic, Epsilon Polypeptide (CHRNE, Accession NM\_000080), a gene which leads to opening of an ion-conducting channel across the plasma membrane. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNE. The function of CHRNE has been established by previous studies. Witzemann et al. (1996) noted that in mammalian muscle the functional properties of end-plate channels change during postnatal development. The length of channel-opening bursts decreases and, as a consequence, the duration of miniature end-plate current (mEPC) decreases, whereas the conductance and the  $\text{Ca}^{2+}$  permeability of end-plate channels increase. The underlying molecular mechanism is a switch in the expression of acetylcholine receptor subunit genes shortly after birth. The gamma-subunit (CHRNA7) is repressed while the epsilon-subunit gene is activated selectively in the myonuclei underlying the synapse. To investigate the significance of the CHRNA7/CHRNE switch for motor behavior, Witzemann et al. (1996) ablated the Chrne gene in mouse embryonic stem (es) cells by homologous recombination and injected correctly engineered cells of 2

independently isolated clones into C57BL/6 blastocysts. Chimeric male mice derived from both clones showed germline transmission of the targeted allele. Homozygous mutant animals showed that after apparently normal development in early neonatal life, neuromuscular transmission was progressively impaired. The lack of epsilon subunits caused muscle weakness, defects in motor behavior, and premature death 2 to 3 months after birth. Their results demonstrated that postnatal incorporation of epsilon subunits in acetylcholine receptors into the end plate is essential for normal development of skeletal muscle.

Ohno et al. (1997) found that each of 3 unrelated patients with the congenital myasthenic syndrome (OMIM Ref. No. 601462) were compound heterozygotes (heteroallelic) for a nonsense mutation and a missense mutation. Each nonsense mutation predicted truncation of the epsilon subunit in its extracellular domain, and expression studies in human embryonic kidney fibroblasts (HEK cells) indicated that they were null mutations. Each missense mutation significantly reduced acetylcholine receptor expression; 2 of the missense mutations resulted in kinetic abnormalities of the receptor and 1 was kinetically benign. One patient was an 11-year-old male who had decreased move-

ments in utero, a weak cry and a feeble suck at birth, ptosis of the eyelids beginning at 5 months of age, and ophthalmoparesis beginning at 2 years of age. He always fatigued easily, could never run well, and had difficulty climbing steps. The nonsense mutation in this patient was a 190C–T transition that converted an arginine codon to a TGA stop codon at position 64 (R64X) of the CHRNE gene. The mutated arginine is conserved across epsilon subunits of other species, but not in other subunits. The other mutation in the CHRNE gene was a 440G–T transversion that predicted to result in an R147L amino acid substitution (100725.0005). Since this transversion altered a nucleotide at the end of exon 5, aberrant splicing was sought but not detected. An affected brother had both mutations; the asymptomatic mother had the R64X allele and the asymptomatic father and brother had the R147L allele.

[67446] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67447] Ohno, K.; Quiram, P. A.; Milone, M.; Wang, H.–L.; Harper, M. C.; Pruitt, J. N., II; Brengman, J. M.; Pao, L.; Fischbeck, K. H.; Crawford, T. O.; Sine, S. M.; Engel, A. G. : Congenital

myasthenic syndromes due to heteroallelic nonsense/mis-sense mutations in the acetylcholine receptor epsilon subunit gene: identification and functional characterization of six new mutations. Hum. Molec. Genet. 6: 753–766, 1997.  
; and

[67448] Witzemann, V.; Schwarz, H.; Koenen, M.; Berberich, C.; Villarroel, A.; Wernig, A.; Brenner, H. R.; Sakmann, B. : Acetylcholine receptor epsilon-subunit deletion causes muscle weakness a.

[67449] Further studies establishing the function and utilities of CHRNE are found in John Hopkins OMIM database record ID 100725, and in cited publications numbered 4113–24 and 11575–4119 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 2',3'-cyclic Nucleotide 3' Phosphodiesterase (CNP, Accession NM\_033133) is another VGAM1959 host target gene. CNP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNP BINDING SITE, designated SEQ ID:26977, to the nucleotide sequence of VGAM1959 RNA, herein

designated VGAM RNA, also designated SEQ ID:4670.

[67450] Another function of VGAM1959 is therefore inhibition of 2',3'-cyclic Nucleotide 3' Phosphodiesterase (CNP, Accession NM\_033133), a gene which can link tubulin to membranes and may regulate cytoplasmic microtubule distribution. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNP. The function of CNP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM443. Contactin 2 (axonal) (CNTN2, Accession NM\_005076) is another VGAM1959 host target gene. CNTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN2 BINDING SITE, designated SEQ ID:11526, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67451] Another function of VGAM1959 is therefore inhibition of Contactin 2 (axonal) (CNTN2, Accession NM\_005076), a

gene which may play a role in axonal growth and cell adhesion. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN2. The function of CNTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259. Collagen, Type I, Alpha 1 (COL1A1, Accession NM\_000088) is another VGAM1959 host target gene. COL1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL1A1 BINDING SITE, designated SEQ ID:5540, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67452] Another function of VGAM1959 is therefore inhibition of Collagen, Type I, Alpha 1 (COL1A1, Accession NM\_000088). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A1. COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11,

Accession NM\_004375) is another VGAM1959 host target gene. COX11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX11 BINDING SITE, designated SEQ ID:10594, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67453] Another function of VGAM1959 is therefore inhibition of COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM\_004375). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX11. Collapsin Response Mediator Protein 1 (CRMP1, Accession NM\_001313) is another VGAM1959 host target gene. CRMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRMP1 BINDING SITE, des-

ignated SEQ ID:6999, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67454] Another function of VGAM1959 is therefore inhibition of Collapsin Response Mediator Protein 1 (CRMP1, Accession NM\_001313), a gene which is a member of dihydropyrimidinase family. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRMP1. The function of CRMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1146. Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM\_022059) is another VGAM1959 host target gene. CXCL16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXCL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCL16 BINDING SITE, designated SEQ ID:22597, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67455] Another function of VGAM1959 is therefore inhibition of Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM\_022059), a gene which induces calcium mobilization. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL16. The function of CXCL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1845.

Chromosome X Open Reading Frame 6 (CXorf6, Accession NM\_005491) is another VGAM1959 host target gene. CXorf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXorf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf6 BINDING SITE, designated SEQ ID:11991, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67456] Another function of VGAM1959 is therefore inhibition of Chromosome X Open Reading Frame 6 (CXorf6, Accession NM\_005491). Accordingly, utilities of VGAM1959 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf6. Drebrin 1 (DBN1, Accession NM\_080881) is another VGAM1959 host target gene. DBN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DBN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBN1 BINDING SITE, designated SEQ ID:28123, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67457] Another function of VGAM1959 is therefore inhibition of Drebrin 1 (DBN1, Accession NM\_080881). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBN1. Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398) is another VGAM1959 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40335,

to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67458] Another function of VGAM1959 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444. Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004013) is another VGAM1959 host target gene. DMD BINDING SITE1 through DMD BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE3, designated SEQ ID:10192, SEQ ID:10219 and SEQ ID:10231 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4670.

[67459] Another function of VGAM1959 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004013), a gene which muscular dystrophy . Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.DXS1283E (Accession XM\_047871) is another VGAM1959 host target gene. DXS1283E BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXS1283E BINDING SITE, designated SEQ ID:35061, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67460] Another function of VGAM1959 is therefore inhibition of DXS1283E (Accession XM\_047871). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DXS1283E. Ephrin-B1 (EFNB1, Accession NM\_004429) is another VGAM1959 host target gene. EFNB1 BINDING SITE1 and EFNB1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EFNB1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB1 BINDING SITE1 and EFNB1 BINDING SITE2, designated SEQ ID:10710 and SEQ ID:10711 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67461] Another function of VGAM1959 is therefore inhibition of Ephrin-B1 (EFNB1, Accession NM\_004429), a gene which is a transmembrane ligand of Eph-related receptor tyrosine kinases, has a role in cell adhesion. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB1. The function of EFNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390.Egl Nine Homolog 2 (*C. elegans*)

(EGLN2, Accession NM\_017555) is another VGAM1959 host target gene. EGLN2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN2 BINDING SITE, designated SEQ ID:18992, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67462] Another function of VGAM1959 is therefore inhibition of Egl Nine Homolog 2 (*C. elegans*) (EGLN2, Accession NM\_017555), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN2. The function of EGLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432. Enoyl-Coenzyme A, Hydratase/3-hydroxyacyl Coenzyme A Dehydrogenase (EHHADH, Accession NM\_001966) is another VGAM1959 host target gene. EHHADH BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by EHHADH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHHADH BINDING SITE, designated SEQ ID:7695, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67463] Another function of VGAM1959 is therefore inhibition of Enoyl-Coenzyme A, Hydratase/3-hydroxyacyl Coenzyme A Dehydrogenase (EHHADH, Accession NM\_001966), a gene which functions in the peroxisomal beta-oxidation pathway. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHHADH. The function of EHHADH has been established by previous studies. Hoefler et al. (1994) reported the full-length cDNA sequence of the enoyl-CoA-hydratase:3-hydroxyacyl-CoA dehydrogenase bifunctional enzyme. The cDNA sequence spans 3,779 nucleotides with an open reading frame of 2,169 nucleotides. Animal model experiments lend further support to the function of EHHADH. Qi et al. (1999) generated Lpb null mice. Mutant mice were viable and fertile and ex-

hibited no detectable gross phenotypic defects. The only defect was a blunting of peroxisome proliferative response upon challenge with a peroxisome proliferator. The absence of appreciable changes in lipid metabolism indicated that enoyl-CoAs, generated in the classical system in Lpb null mice, were diverted to the D-hydroxy-specific system for metabolism by Dpb (OMIM Ref. No. 601860).

[67464] It is appreciated that the abovementioned animal model for EHHADH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[67465] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67466] Hoefler, G.; Forstner, M.; McGuinness, M. C.; Hulla, W.; Hidden, M.; Krisper, P.; Kenner, L.; Ried, T.; Lengauer, C.; Zechner, R.; mOser, H. W.; Chen, G. L. : cDNA cloning of the human peroxisomal enoyl-CoA hydratase:3-hydroxyacyl-CoA dehydrogenase bifunctional enzyme and localization to chromosome 3q26.3-3q28: a free left Alu arm is inserted in the 3-prime noncoding region. [67468] Further studies establishing the function and utilities of EHHADH are found in John Hopkins OMIM database record ID 607037, and in cited publications numbered 5170 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ELAV (embryonic lethal, abnormal vision, *Drosophila*)-like 3 (Hu antigen C) (ELAVL3, Accession NM\_001420) is another VGAM1959 host target gene. ELAVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELAVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELAVL3 BINDING SITE, designated SEQ ID:7119, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67469] Another function of VGAM1959 is therefore inhibition of ELAV (embryonic lethal, abnormal vision, *Drosophila*)-like 3 (Hu antigen C) (ELAVL3, Accession NM\_001420), a gene

which arises when an immune response to systemic tumors expressing neuronal proteins develops into an autoimmune neuronal degeneration. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELAVL3. The function of ELAVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM883. Endonuclease G (ENDOG, Accession NM\_004435) is another VGAM1959 host target gene. ENDOG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ENDOG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENDOG BINDING SITE, designated SEQ ID:10720, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67470] Another function of VGAM1959 is therefore inhibition of Endonuclease G (ENDOG, Accession NM\_004435), a gene which cleaves double and single stranded dna. also has ribonuclease (rnase) and rnase h activities. capable of gen-

erating the rna primers required to initiate replication of mitochondrial dna . Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDOG. The function of ENDOG has been established by previous studies. Tiranti et al. (1995) mapped 3 human housekeeping genes involved in mitochondrial biogenesis. One of these was the gene encoding a mitochondrion-specific endonuclease, designated ENDOG, that preferentially cleaves DNA stretches rich in C and G residues. The authors hypothesized that this endonuclease could play a role in the maturation of RNA complementary stretches serving as primers for mtDNA replication, in the splicing process of polycistronic transcripts, or in mtDNA repair. By PCR-based screening of a somatic cell hybrid panel and by fluorescence in situ hybridization, Tiranti et al. (1995) assigned the ENDOG locus to 9q34.1. Li et al. (2001) identified endoG as the nuclease specifically activated by apoptotic stimuli and able to induce nucleosomal fragmentation of DNA in fibroblast cells from embryonic mice lacking DFF45 (OMIM Ref. No. 601882). EndoG is a mitochondrion-specific nuclease that translocates to the nucleus during apoptosis. Once released from mitochondria, en-

doG cleaves chromatin DNA into nucleosomal fragments independently of caspases (see OMIM Ref. No. 147678). Therefore, ENDOG represents a caspase-independent apoptotic pathway initiated from the mitochondria. In *C. elegans*, Parrish et al. (2001) found that reduction of activity of cps6, a homolog of ENDOG, affected normal DNA degradation and resulted in delayed appearance of cell corpses during development. This observation provided in vivo evidence that the DNA degradation process is important for proper progression of apoptosis. Parrish et al. (2001) stated that CPS6 is the first mitochondrial protein identified to be involved in programmed cell death in *C. elegans*, underscoring the conserved and important role of mitochondria in the execution of apoptosis

[67471] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67472] Li, L. Y.; Luo, X.; Wang, X. : Endonuclease G is an apoptotic DNase when released from mitochondria. *Nature* 412: 95–99, 2001. ; and

[67473] Parrish, J.; Li, L.; Klotz, K.; Ledwich, D.; Wang, X.; Xue, D. : Mitochondrial endonuclease G is important for apoptosis in *C. elegans*. *Nature* 412: 90–94, 2001.

[67474] Further studies establishing the function and utilities of ENDOG are found in John Hopkins OMIM database record ID 600440, and in cited publications numbered 7707–770 and 7706 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Epidermal Growth Factor Receptor Pathway Substrate 15 (EPS15, Accession NM\_001981) is another VGAM1959 host target gene. EPS15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPS15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPS15 BINDING SITE, designated SEQ ID:7712, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67475] Another function of VGAM1959 is therefore inhibition of Epidermal Growth Factor Receptor Pathway Substrate 15 (EPS15, Accession NM\_001981), a gene which involved in cell growth regulation. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPS15. The function of EPS15 has been established by previous studies.

Fazioli et al. (1993) developed an expression cloning approach which, applied to the study of epidermal growth factor receptor (EGFR)-activated signaling, yielded a number of murine cDNA clones, referred to as eps (for egfr-pathway-substrate) clones. One of these clones, eps15, encoded a protein of 140 to 150 kD which was phosphorylated on tyrosine following activation of the EGFR (OMIM Ref. No. 131550) and platelet-derived growth factor receptor (PDGFR; 173410). Phosphorylation of eps15 appeared relatively receptor-specific since the erbB-2 receptor (OMIM Ref. No. 164870), which is highly related to EGFR, was not able to phosphorylate it efficiently. Wong et al. (1994) cloned the human homolog and mapped the EPS15 gene to 1p32-p31 by analysis of human/rodent hybrids retaining various segments of human chromosome 1. The region of assignment is one involved in deletion in neuroblastoma, translocations in acute lymphoblastic leukemia, and a fragile site. Most of the translocations affecting the chromosome band 11q23 in human acute leukemias involve a restricted area of the HRX gene, also known as MLL for myeloid/lymphoid, or mixed-lineage leukemia (OMIM Ref. No. 159555). Other partners in the fused gene created by the translocation in-

clude AF4 (OMIM Ref. No. 159557) on chromosome 4, AF9 (OMIM Ref. No. 159558) on chromosome 9, and ENL (OMIM Ref. No. 159556) on chromosome 19. Indeed, at least 15 different chromosomal partners have been involved with MLL (also known as ALL1) in leukemia-producing translocations. In 2 myeloid leukemias, the derivative chromosome 11 expressed the 1368 N-terminal amino acids MLL fused to almost all the AF1P product. The predicted wildtype AF1P product was a 98-kD acidic protein that exhibited no similarity to AF4, AF9, and ENL gene products. It was highly similar to the murine EPS15 gene product. Bernard et al. (1994) characterized 2 t(1;11)(p32;q11) translocations that fused the MML gene to a novel gene, tentatively designated AF1P, on 1p32. Their AF1P is clearly the same gene as EPS15.

[67476] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67477] Fazioli, F.; Minichiello, L.; Matoska, V.; Castagnino, P.; Miki, T.; Wong, W. T.; Di Fiore, P. P. : Eps8, a substrate for the epidermal growth factor receptor kinase, enhances EGF-dependent mitogenic signals. EMBO J. 12: 3799–3808, 1993. ; and

[67478] Bernard, O. A.; Mauchauffe, M.; Mecucci, C.; Van Den Berghe, H.; Berger, R. : A novel gene, AF-1p, fused to HRX in t(1;11)(p32;q23), is not related to AF-4, AF-9 nor ENL. Oncogene 9: 103.

[67479] Further studies establishing the function and utilities of EPS15 are found in John Hopkins OMIM database record ID 600051, and in cited publications numbered 7726–7730 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ets Variant Gene 5 (ets-related molecule) (ETV5, Accession NM\_004454) is another VGAM1959 host target gene. ETV5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ETV5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETV5 BINDING SITE, designated SEQ ID:10750, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67480] Another function of VGAM1959 is therefore inhibition of Ets Variant Gene 5 (ets-related molecule) (ETV5, Accession NM\_004454), a gene which DNA binding protein of the Ets oncoprotein family. Accordingly, utilities of VGAM1959

include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETV5. The function of ETV5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1171. Ellis Van Creveld Syndrome (EVC, Accession NM\_014556) is another VGAM1959 host target gene. EVC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:15896, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67481] Another function of VGAM1959 is therefore inhibition of Ellis Van Creveld Syndrome (EVC, Accession NM\_014556). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC. Exostoses (multiple) 1 (EXT1, Accession NM\_000127) is another VGAM1959 host target gene. EXT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

EXT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXT1 BINDING SITE, designated SEQ ID:5603, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67482] Another function of VGAM1959 is therefore inhibition of Exostoses (multiple) 1 (EXT1, Accession NM\_000127). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXT1. Enhancer of Zeste Homolog 1 (Drosophila) (EZH1, Accession NM\_001991) is another VGAM1959 host target gene. EZH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EZH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EZH1 BINDING SITE, designated SEQ ID:7718, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67483] Another function of VGAM1959 is therefore inhibition of Enhancer of Zeste Homolog 1 (Drosophila) (EZH1, Acces-

sion NM\_001991), a gene which may act in transcriptional regulation and heterochromatin maintenance. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZH1. The function of EZH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM251. Fanconi Anemia, Complement Group F (FANCF, Accession NM\_022725) is another VGAM1959 host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:22921, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67484] Another function of VGAM1959 is therefore inhibition of Fanconi Anemia, Complement Group F (FANCF, Accession NM\_022725). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. Fatty Acid

Synthase (FASN, Accession NM\_004104) is another VGAM1959 host target gene. FASN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FASN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FASN BINDING SITE, designated SEQ ID:10316, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67485] Another function of VGAM1959 is therefore inhibition of Fatty Acid Synthase (FASN, Accession NM\_004104), a gene which catalyzes the formation of long-chain fatty acids from acetyl-coa, malonyl-coa and nadph. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FASN. The function of FASN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM477. Fibroblast Growth Factor 23 (FGF23, Accession NM\_020638) is another VGAM1959 host target gene. FGF23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FGF23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF23 BINDING SITE, designated SEQ ID:21792, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67486] Another function of VGAM1959 is therefore inhibition of Fibroblast Growth Factor 23 (FGF23, Accession NM\_020638), a gene which is a member of the fibroblast growth factor family . Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF23. The function of FGF23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24. Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806) is another VGAM1959 host target gene. FLNB BINDING SITE1 and FLNB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLNB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of FLNB BINDING SITE1 and FLNB BINDING SITE2, designated SEQ ID:31140 and SEQ ID:31141 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67487] Another function of VGAM1959 is therefore inhibition of Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806), a gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLNB. The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM416. Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860) is another VGAM1959 host target gene. FSTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL3 BINDING SITE, designated SEQ ID:12468, to the nucleotide se-

quence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67488] Another function of VGAM1959 is therefore inhibition of Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860), a gene which is a member of the follistatin-module-protein family. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL3. The function of FSTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM\_022003) is another VGAM1959 host target gene. FXYD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FXYD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD6 BINDING SITE, designated SEQ ID:22553, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67489] Another function of VGAM1959 is therefore inhibition of

FXYP Domain Containing Ion Transport Regulator 6 (FXYP6, Accession NM\_022003). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYP6. Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM\_022041) is another VGAM1959 host target gene. GAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:22566, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67490] Another function of VGAM1959 is therefore inhibition of Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM\_022041), a gene which plays an important role in neurofilament architecture. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAN. The function of GAN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM606. GATA Binding Protein 2 (GATA2, Accession NM\_002050) is another VGAM1959 host target gene. GATA2 BINDING SITE1 and GATA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GATA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE1 and GATA2 BINDING SITE2, designated SEQ ID:7803 and SEQ ID:7807 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67491] Another function of VGAM1959 is therefore inhibition of GATA Binding Protein 2 (GATA2, Accession NM\_002050). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2. Glyoxalase I (GLO1, Accession NM\_006708) is another VGAM1959 host target gene. GLO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of GLO1 BINDING SITE, designated SEQ ID:13528, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67492] Another function of VGAM1959 is therefore inhibition of Glyoxalase I (GLO1, Accession NM\_006708), a gene which converts methylglyoxal and glutathione to S-lactoylglutathione. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLO1. The function of GLO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786. Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM\_006496) is another VGAM1959 host target gene. GNAI3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI3 BINDING SITE, designated SEQ ID:13242, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ

ID:4670.

[67493] Another function of VGAM1959 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM\_006496), a gene which stimulates receptor regulated K<sup>+</sup>-channels. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI3. The function of GNAI3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM45.G Protein-coupled Receptor 44 (GPR44, Accession NM\_004778) is another VGAM1959 host target gene. GPR44 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR44 BINDING SITE, designated SEQ ID:11176, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67494] Another function of VGAM1959 is therefore inhibition of G

Protein-coupled Receptor 44 (GPR44, Accession NM\_004778), a gene which mediates signals to the interior of the cell via activation of heterotrimeric G proteins . Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR44. The function of GPR44 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1669. G Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM\_139209) is another VGAM1959 host target gene. GPRK7 BINDING SITE1 and GPRK7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GPRK7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRK7 BINDING SITE1 and GPRK7 BINDING SITE2, designated SEQ ID:29227 and SEQ ID:29230 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67495] Another function of VGAM1959 is therefore inhibition of G Protein-coupled Receptor Kinase 7 (GPRK7, Accession

NM\_139209), a gene which may play a role in signal transduction pathways that involve calcium as a second messenger. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK7. The function of GPRK7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM640. Histone Deacetylase 4 (HDAC4, Accession NM\_006037) is another VGAM1959 host target gene. HDAC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC4 BINDING SITE, designated SEQ ID:12661, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67496] Another function of VGAM1959 is therefore inhibition of Histone Deacetylase 4 (HDAC4, Accession NM\_006037), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and

may mediate transcriptional regulation. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC4. The function of HDAC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Histone Deacetylase 7A (HDAC7A, Accession NM\_015401) is another VGAM1959 host target gene. HDAC7A BINDING SITE1 and HDAC7A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HDAC7A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC7A BINDING SITE1 and HDAC7A BINDING SITE2, designated SEQ ID:17714 and SEQ ID:18684 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67497] Another function of VGAM1959 is therefore inhibition of Histone Deacetylase 7A (HDAC7A, Accession NM\_015401). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC7A. Interferon (alpha, beta and

omega) Receptor 2 (IFNAR2, Accession NM\_000874) is another VGAM1959 host target gene. IFNAR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IFNAR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNAR2 BINDING SITE, designated SEQ ID:6555, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67498] Another function of VGAM1959 is therefore inhibition of Interferon (alpha, beta and omega) Receptor 2 (IFNAR2, Accession NM\_000874), a gene which is a receptor for interferons alpha and beta. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR2. The function of IFNAR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM487. Insulin-like Growth Factor Binding Protein 5 (IGFBP5, Accession NM\_000599) is another VGAM1959 host target gene. IGFBP5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by IGFBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP5 BINDING SITE, designated SEQ ID:6203, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67499] Another function of VGAM1959 is therefore inhibition of Insulin-like Growth Factor Binding Protein 5 (IGFBP5, Accession NM\_000599), a gene which either inhibits or stimulates the growth promoting effects of the igfs on cell culture. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP5. The function of IGFBP5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1233. Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878) is another VGAM1959 host target gene. IL2RB BINDING SITE1 and IL2RB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by IL2RB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RB BINDING SITE1 and IL2RB BINDING SITE2, designated SEQ ID:6571 and SEQ ID:6572 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67500] Another function of VGAM1959 is therefore inhibition of Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RB. The function of IL2RB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450. IRTA1 (Accession NM\_031282) is another VGAM1959 host target gene. IRTA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRTA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA1 BINDING SITE, designated SEQ ID:25305,

to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67501] Another function of VGAM1959 is therefore inhibition of IRTA1 (Accession NM\_031282). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA1. Immunoglobulin Superfamily Containing Leucine-rich Repeat (ISLR, Accession NM\_005545) is another VGAM1959 host target gene. ISLR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ISLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ISLR BINDING SITE, designated SEQ ID:12073, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67502] Another function of VGAM1959 is therefore inhibition of Immunoglobulin Superfamily Containing Leucine-rich Repeat (ISLR, Accession NM\_005545). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISLR. IL2-inducible T-cell Kinase (ITK, Accession

NM\_005546) is another VGAM1959 host target gene. ITK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:12075, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67503] Another function of VGAM1959 is therefore inhibition of IL2-inducible T-cell Kinase (ITK, Accession NM\_005546), a gene which plays a role in t cell proliferation and differentiation. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITK. The function of ITK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM288. Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224) is another VGAM1959 host target gene. ITPR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR3, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR3 BINDING SITE, designated SEQ ID:8001, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67504] Another function of VGAM1959 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM\_002224), a gene which may be responsible for calcium release from intracellular stores. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR3. The function of ITPR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM310. Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM\_003024) is another VGAM1959 host target gene. ITSN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITSN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITSN1 BINDING SITE, designated SEQ ID:8958, to the nucleotide sequence of VGAM1959 RNA,

herein designated VGAM RNA, also designated SEQ ID:4670.

[67505] Another function of VGAM1959 is therefore inhibition of Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM\_003024), a gene which may be involved in endocytosis and synaptic vesicle recycling. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITSN1. The function of ITSN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1233. Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM\_002241) is another VGAM1959 host target gene. KCNJ10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ10 BINDING SITE, designated SEQ ID:8026, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67506] Another function of VGAM1959 is therefore inhibition of

Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM\_002241), a gene which may be responsible for potassium buffering action of glial cells in the brain. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ10. The function of KCNJ10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167. Potassium Channel, Subfamily K, Member 1 (KCNK1, Accession NM\_002245) is another VGAM1959 host target gene. KCNK1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK1 BINDING SITE, designated SEQ ID:8033, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67507] Another function of VGAM1959 is therefore inhibition of Potassium Channel, Subfamily K, Member 1 (KCNK1, Accession NM\_002245), a gene which is an inward rectifying

potassium channel. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK1. The function of KCNK1 has been established by previous studies. Potassium channels are functionally important to a large number of cellular processes including maintenance of the action potential, muscle contraction, hormone secretion, osmotic regulation, and ion flow. Lesage et al. (1996) cloned a member of a new class of potassium channels by computer identification of an EST with predicted sequence similarity to the P domain (a region involved in the potassium conduction pathway) of previously known channels. A cDNA, designated TWIK1 by the authors, was obtained from a human kidney library and shown to encode a predicted 336-amino acid protein. Unlike other potassium channels, TWIK1 has 4 (rather than 6) transmembrane domains and 2 (rather than 1) P domains. Two genes from *C. elegans* are related. When expressed in *Xenopus* oocytes, TWIK1 is able to direct expression of weakly inward-rectifying potassium currents. Northern blots showed that the gene is transcribed in a large number of tissues but is especially highly expressed in the brain and heart. The authors speculated that TWIK1 channels may be involved

in the control of background potassium membrane conductances. Lesage et al. (1996) mapped the gene by in situ hybridization to 1q42–q43.

[67508] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67509] Lesage, F.; Guillemare, E.; Fink, M.; Duprat, F.; Lazdunski, M.; Romey, G.; Barhanin, J. : TWIK–1, a ubiquitous human weakly inward rectifying K<sup>+</sup> channel with a novel structure. EMBO J. 15: 1004–1011, 1996. ; and

[67510] Lesage, F.; Mattei, M.–G.; Fink, M.; Barhanin, J.; Lazdunski, M. : Assignment of the human weak inward rectifier K<sup>+</sup> channel TWIK–1 gene to chromosome 1q42–q43. Genomics 34: 153–155, 1996.

[67511] Further studies establishing the function and utilities of KCNK1 are found in John Hopkins OMIM database record ID 601745, and in cited publications numbered 6203–6204 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Channel, Subfamily K, Member 5 (KCNK5, Accession NM\_003740) is another VGAM1959 host target gene. KCNK5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

KCNK5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK5 BINDING SITE, designated SEQ ID:9829, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67512] Another function of VGAM1959 is therefore inhibition of Potassium Channel, Subfamily K, Member 5 (KCNK5, Accession NM\_003740). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK5. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 2 (KCNS2, Accession XM\_043106) is another VGAM1959 host target gene. KCNS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS2 BINDING SITE, designated SEQ ID:33901, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67513] Another function of VGAM1959 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Sub-family S, Member 2 (KCNS2, Accession XM\_043106), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS2. The function of KCNS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419. Kinase Insert Domain Receptor (a type III receptor tyrosine kinase) (KDR, Accession NM\_002253) is another VGAM1959 host target gene. KDR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KDR BINDING SITE, designated SEQ ID:8053, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67514] Another function of VGAM1959 is therefore inhibition of Kinase Insert Domain Receptor (a type III receptor tyrosine

kinase) (KDR, Accession NM\_002253). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KDR. KIAA0857 (Accession XM\_039552) is another VGAM1959 host target gene. KIAA0857 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0857, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0857 BINDING SITE, designated SEQ ID:33121, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67515] Another function of VGAM1959 is therefore inhibition of KIAA0857 (Accession XM\_039552), a gene which is involved in cytoskeletal organization and cellular growth. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0857. The function of KIAA0857 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM548.Kinesin Family Member 5C (KIF5C, Accession

NM\_004522) is another VGAM1959 host target gene.

KIF5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:10854, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67516] Another function of VGAM1959 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM\_004522). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. Kinesin Family Member C3 (KIFC3, Accession NM\_005550) is another VGAM1959 host target gene. KIFC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIFC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIFC3 BINDING SITE, designated SEQ ID:12081, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4670.

[67517] Another function of VGAM1959 is therefore inhibition of Kinesin Family Member C3 (KIFC3, Accession NM\_005550), a gene which may function in intracellular transport and mitosis. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIFC3. The function of KIFC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1006. Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM\_002293) is another VGAM1959 host target gene. LAMC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:8078, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67518] Another function of VGAM1959 is therefore inhibition of Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession

NM\_002293), a gene which may mediate the attachment, migration, and organization of cells into tissues. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC1. The function of LAMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM812. Lamin B Receptor (LBR, Accession XM\_001795) is another VGAM1959 host target gene. LBR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LBR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBR BINDING SITE, designated SEQ ID:29854, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67519] Another function of VGAM1959 is therefore inhibition of Lamin B Receptor (LBR, Accession XM\_001795). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBR. Lunatic Fringe Homolog (Drosophila) (LFNG, Accession XM\_166539) is another VGAM1959 host target

gene. LFNG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFNG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFNG BINDING SITE, designated SEQ ID:44509, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67520] Another function of VGAM1959 is therefore inhibition of Lunatic Fringe Homolog (Drosophila) (LFNG, Accession XM\_166539). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFNG. Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM\_002309) is another VGAM1959 host target gene. LIF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIF BINDING SITE, designated SEQ ID:8095, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67521] Another function of VGAM1959 is therefore inhibition of Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM\_002309). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIF. Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310) is another VGAM1959 host target gene. LIFR BINDING SITE1 and LIFR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIFR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIFR BINDING SITE1 and LIFR BINDING SITE2, designated SEQ ID:8104 and SEQ ID:8106 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67522] Another function of VGAM1959 is therefore inhibition of Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIFR. Lymphotoxin Beta (TNF superfamily, member 3) (LTB, Accession NM\_009588)

is another VGAM1959 host target gene. LTB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LTB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTB BINDING SITE, designated SEQ ID:14315, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67523] Another function of VGAM1959 is therefore inhibition of Lymphotoxin Beta (TNF superfamily, member 3) (LTB, Accession NM\_009588). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTB. Mannose-6-phosphate Receptor (cation dependent) (M6PR, Accession NM\_002355) is another VGAM1959 host target gene. M6PR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by M6PR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M6PR BINDING SITE, designated SEQ ID:8164, to the nucleotide sequence of VGAM1959 RNA, herein

designated VGAM RNA, also designated SEQ ID:4670.

[67524] Another function of VGAM1959 is therefore inhibition of Mannose-6-phosphate Receptor (cation dependent) (M6PR, Accession NM\_002355), a gene which is involved in intracellular sorting and transport of acid hydrolases. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M6PR. The function of M6PR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924. MAD, Mothers Against Decapentaplegic Homolog 5 (Drosophila) (MADH5, Accession NM\_005903) is another VGAM1959 host target gene. MADH5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MADH5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH5 BINDING SITE, designated SEQ ID:12523, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67525] Another function of VGAM1959 is therefore inhibition of

MAD, Mothers Against Decapentaplegic Homolog 5 (Drosophila) (MADH5, Accession NM\_005903), a gene which is a transcriptional modulator activated by bmp (bone morphogenetic proteins) type 1 receptor kinase. smad5 is a receptor-regulated smad (r-smad). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH5. The function of MADH5 has been established by previous studies. Gemma et al. (1998) determined the full-length cDNA sequence of human MADH5, which they called SMAD5. Comparison of the cDNA sequence with the SMAD5 genomic sequence, obtained from YAC clones, showed that the SMAD5 gene has 8 exons, with the coding sequence contained in exons 3 to 8. By 5-prime RACE, the authors identified a SMAD5 cDNA derived from an alternatively spliced transcript that lacks the 75-bp exon 2. Using PCR-SSCP analysis to investigate the frequency of SMAD5 somatic mutations in human cancers, Gemma et al. (1998) did not detect either homozygous deletions or point mutations in 40 primary gastric tumors or 51 cell lines derived from diverse types of cancer, including 20 cell lines resistant to the growth inhibitory effects of TGF-beta. The SMAD5 protein has strong homol-

ogy with SMAD1 (OMIM Ref. No. 601595), SMAD2 (OMIM Ref. No. 601366), SMAD3 (OMIM Ref. No. 603109), and SMAD4 (OMIM Ref. No. 600993) in the N- and C-terminal domains, which are separated by a proline-rich sequence; SMAD5 shows the greatest homology to SMAD1. Bruno et al. (1998) showed that SMAD5 plays a critical role in the signaling pathway by which TGF-beta inhibits the proliferation of human hematopoietic progenitor cells.

[67526] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67527] Bruno, E.; Horrigan, S. K.; Van Den Berg, D.; Rozler, E.; Fitting, P. R.; Moss, S. T.; Westbrook, C.; Hoffman, R. : The Smad5 gene is involved in the intracellular signaling pathways that mediate the inhibitory effects of transforming growth factor-beta on human hematopoiesis. Blood 91: 1917-1923, 1998. ; and

[67529] Further studies establishing the function and utilities of MADH5 are found in John Hopkins OMIM database record

ID 603110, and in cited publications numbered 8582–858 and 6480 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mastermind-like 1 (Drosophila) (MAML1, Accession NM\_014757) is another VGAM1959 host target gene. MAML1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAML1 BINDING SITE, designated SEQ ID:16497, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67530] Another function of VGAM1959 is therefore inhibition of Mastermind-like 1 (Drosophila) (MAML1, Accession NM\_014757), a gene which MAML1 functions as a transcriptional coactivator for Notch signaling. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAML1. The function of MAML1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM556. Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373) is another VGAM1959 host target gene. MAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1A BINDING SITE, designated SEQ ID:8187, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67531] Another function of VGAM1959 is therefore inhibition of Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373), a gene which is a structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1A. The function of MAP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM\_003926) is another VGAM1959 host

target gene. MBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD3 BINDING SITE, designated SEQ ID:10018, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67532] Another function of VGAM1959 is therefore inhibition of Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM\_003926), a gene which are subunits of the NURD (nucleosome remodeling and histone deacetylase) complex. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD3. The function of MBD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Myelin Basic Protein (MBP, Accession XM\_117096) is another VGAM1959 host target gene. MBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBP, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBP BINDING SITE, designated SEQ ID:43221, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67533] Another function of VGAM1959 is therefore inhibition of Myelin Basic Protein (MBP, Accession XM\_117096), a gene which Myelin basic protein; a constituent of myelin, plays a role in nerve function. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBP. The function of MBP has been established by previous studies. Eosinophil granule major basic protein (MBP) comprises the crystalloid core of the eosinophil granule. Wasmoen et al. (1988) and Weller et al. (1988) published a partial amino acid sequence for MBP, also designated proteoglycan-2 (PRG2). Using this partial sequence, Barker et al. (1988) isolated a full-length PRG2 cDNA from a human promyelocytic leukemia cell line (HL60) cDNA library. McGrogan et al. (1988) independently isolated a PRG2 cDNA from an HL60 cell line cDNA. Yoshimatsu et al. (1992) also identified PRG2 in a search for a natural killer (NK) cell-

activating factor purified from the supernatant of a T-cell hybridoma. McGrogan et al. (1988) and Barker et al. (1988) determined that the PRG2 cDNA encodes a deduced 222-amino acid protein with a 15-amino acid hydrophobic signal sequence. PRG2 is initially translated as a 25-kD preproprotein that is posttranslationally modified to a proprotein. Posttranslational modification results in the mature form of PRG2, which is encoded by the carboxy 117 amino acids of the preproprotein and has a molecular mass of 14 kD. The 90-amino acid N-terminal domain has 1 potential N-linked glycosylation site. Yoshimatsu et al. (1992) reported that the C-terminal end of PRG2 shares homology with animal lectins. McGrogan et al. (1988) determined that the putative PRG2 proprotein is a bipolar molecule. The amino-terminal half is hydrophilic, whereas the mature PRG2 is hydrophobic. Barker et al. (1988) hypothesized that the translation of PRG2 as a bipolar proprotein may mask the toxic effects of the mature PRG2 and protect the eosinophil from damage while the protein is processed through the endoplasmic reticulum to its sequestered site in the eosinophil granule. Using Northern blot analysis, McGrogan et al. (1988) detected a major 1-kb transcript and a minor

0.5-kb PRG2 transcript in HL60 cells. By the same method, Li et al. (1995) detected a 1-kb transcript in immature cells including bone-marrow and HL60 cells, but not in purified blood eosinophils. Using RT-PCR, Li et al. (1995) detected an additional 1.6-kb transcript in bone marrow cells and HL60 cells at lower levels than the 1-kb transcript. In differentiated blood eosinophils from idiopathic hypereosinophilic syndrome patients, the 1.6-kb transcript predominated. The International Radiation Hybrid Mapping Consortium mapped the PRG2 gene to chromosome 11 (A005W41). By FISH, Plager et al. (2001) mapped the PRG2 and PRG3 (OMIM Ref. No. 606814) genes to chromosome 11cen-q12. Animal model experiments lend further support to the function of MBP.

[67534] It is appreciated that the abovementioned animal model for MBP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[67535] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67536] Li, M.-S.; Sun, L.; Satoh, T.; Fisher, L. M.; Spry, C. J. F. : Human eosinophil major basic protein, a mediator of al-

lergic inflammation, is expressed by alternative splicing from two promoters. Biochem. J. 305: 921–927, 1995. ; and

[67537] Plager, D. A.; Weiler, D. A.; Loegering, D. A.; Johnson, W. B.; Haley, L.; Eddy, R. L.; Shows, T. B.; Gleich, G. J. : Comparative structure, proximal promoter elements, and chromosome lo.

[67538] Further studies establishing the function and utilities of MBP are found in John Hopkins OMIM database record ID 605601, and in cited publications numbered 6995–7001 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397) is another VGAM1959 host target gene. MEF2C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEF2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2C BINDING SITE, designated SEQ ID:8214, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67539] Another function of VGAM1959 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2C. The function of MEF2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM386. MADS Box Transcription Enhancer Factor 2, Polypeptide D (myocyte enhancer factor 2D) (MEF2D, Accession XM\_173049) is another VGAM1959 host target gene. MEF2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2D BINDING SITE, designated SEQ ID:46307, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67540] Another function of VGAM1959 is therefore inhibition of

MADS Box Transcription Enhancer Factor 2, Polypeptide D (myocyte enhancer factor 2D) (MEF2D, Accession XM\_173049), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2D. The function of MEF2D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1306. Methyltransferase-like 1 (METTL1, Accession NM\_023032) is another VGAM1959 host target gene. METTL1 BINDING SITE1 and METTL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by METTL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of METTL1 BINDING SITE1 and METTL1 BINDING SITE2, designated SEQ ID:23307 and SEQ ID:23312 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67541] Another function of VGAM1959 is therefore inhibition of Methyltransferase-like 1 (METTL1, Accession

NM\_023032). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with METTL1. Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM\_015166) is another VGAM1959 host target gene. MLC1 BINDING SITE1 and MLC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MLC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLC1 BINDING SITE1 and MLC1 BINDING SITE2, designated SEQ ID:17523 and SEQ ID:29217 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67542] Another function of VGAM1959 is therefore inhibition of Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM\_015166). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLC1. Mature T-cell Proliferation 1 (MTCP1, Accession NM\_014221) is another VGAM1959 host target gene. MTCP1 BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by MTCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCP1 BINDING SITE, designated SEQ ID:15486, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67543] Another function of VGAM1959 is therefore inhibition of Mature T-cell Proliferation 1 (MTCP1, Accession NM\_014221). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCP1. Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458) is another VGAM1959 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17747, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67544] Another function of VGAM1959 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379. Mevalonate Kinase (mevalonic aciduria) (MVK, Accession XM\_027151) is another VGAM1959 host target gene. MVK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MVK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MVK BINDING SITE, designated SEQ ID:30425, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67545] Another function of VGAM1959 is therefore inhibition of Mevalonate Kinase (mevalonic aciduria) (MVK, Accession XM\_027151). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with MVK. N-acetylgalactosaminidase, Alpha- (NAGA, Accession NM\_000262) is another VGAM1959 host target gene. NAGA BINDING SITE1 and NAGA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NAGA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAGA BINDING SITE1 and NAGA BINDING SITE2, designated SEQ ID:5799 and SEQ ID:5802 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67546] Another function of VGAM1959 is therefore inhibition of N-acetylgalactosaminidase, Alpha- (NAGA, Accession NM\_000262). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAGA. Niemann-Pick Disease, Type C1 (NPC1, Accession NM\_000271) is another VGAM1959 host target gene. NPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPC1 BINDING SITE, designated SEQ ID:5814, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67547] Another function of VGAM1959 is therefore inhibition of Niemann–Pick Disease, Type C1 (NPC1, Accession NM\_000271). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPC1. Neuronal Pentraxin II (NPTX2, Accession XM\_166492) is another VGAM1959 host target gene. NPTX2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPTX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX2 BINDING SITE, designated SEQ ID:44425, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67548] Another function of VGAM1959 is therefore inhibition of Neuronal Pentraxin II (NPTX2, Accession XM\_166492), a gene which is likely to play role in the modification of cel–

lular properties that underlie long-term plasticity. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX2. The function of NPTX2 has been established by previous studies. Pentraxins constitute a family of proteins that include C-reactive protein (CRP; 123260) and serum amyloid P protein (APCS; 104770). Hsu and Perin (1995) noted that the prototypic pentraxin, C-reactive protein, was first identified as a serum component that binds *Streptococcus pneumoniae* (Tillett and Francis, 1930 and Abernethy and Avery, 1941) and whose serum concentration increases up to 1,000-fold during an acute phase response. Pentraxins acquired their name from their ability to form pentameric (or decameric) complexes and have been characterized by their ability to bind numerous ligands. The latter property raises the possibility that these proteins may mediate a nonspecific uptake of bacteria and cell debris that may be associated with inflammation and immune responses. Schlimgen et al. (1995) identified a novel neuronal pentraxin in rat as a potential receptor mediating the uptake of the presynaptic snake venom toxin taipoxin (see OMIM Ref. No. NPTX1, 602367). Based on the low identity to other pentraxins

and the hypothesis that this neuronal pentraxin may mediate uptake of degraded synaptic material, Hsu and Perin (1995) sought to identify additional members of what they suspected represents a new family of pentraxins. They reported the cDNA and genomic sequences of a second neuronal pentraxin in humans, for which they proposed the name neuronal pentraxin II (NPTX2). They found that it shows 54% amino acid identity to rat neuronal pentraxin I, with 69% identity over the carboxy-terminal half of NP I, and is 88% identical to a sperm acrosomal pentraxin. Northern blot analysis demonstrated that NPTX2 message is present in brain, testis, pancreas, liver, heart, and skeletal muscle; thus, unlike NP I, NP II is not exclusively localized to neurons. Like NP I, NP II has potential N-linked glycosylation sites. The human NPTX2 gene is 11 kb long and contains 4 introns. By fluorescence in situ hybridization, Hsu and Perin (1995) mapped the NPTX2 gene to 7q21.3–q22.1.

[67549] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67550] Hsu, Y.-C.; Perin, M. S. : Human neuronal pentraxin II (NPTX2): conservation, genomic structure, and chromoso-

mal localization. Genomics 28: 220–227, 1995. ; and

[67551] Schlimgen, A. K.; Helms, J. A.; Vogel, H.; Perin, M. S. :  
Neuronal pentraxin, a secreted protein with homology to  
acute phase proteins of the immune system. Neuron 14:  
519–526, 1995.

[67552] Further studies establishing the function and utilities of  
NPTX2 are found in John Hopkins OMIM database record  
ID 600750, and in cited publications numbered 3786,  
7571–757 and 3787 listed in the bibliography section  
hereinbelow, which are also hereby incorporated by refer-  
ence. Nuclear Receptor Subfamily 3, Group C, Member 2  
(NR3C2, Accession NM\_000901) is another VGAM1959  
host target gene. NR3C2 BINDING SITE is HOST TARGET  
binding site found in the 3` untranslated region of mRNA  
encoded by NR3C2, corresponding to a HOST TARGET  
binding site such as BINDING SITE I, BINDING SITE II or  
BINDING SITE III. Table 2 illustrates the complementarity  
of the nucleotide sequences of NR3C2 BINDING SITE, des-  
ignated SEQ ID:6595, to the nucleotide sequence of  
VGAM1959 RNA, herein designated VGAM RNA, also des-  
ignated SEQ ID:4670.

[67553] Another function of VGAM1959 is therefore inhibition of  
Nuclear Receptor Subfamily 3, Group C, Member 2

(NR3C2, Accession NM\_000901), a gene which is to increase ion and water transport and thus raise extracellular fluid volume and blood pressure and lower potassium levels. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C2. The function of NR3C2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM186.Nebulin-related Anchoring Protein (Nrap, Accession NM\_139235) is another VGAM1959 host target gene. Nrap BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Nrap, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nrap BINDING SITE, designated SEQ ID:29239, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67554] Another function of VGAM1959 is therefore inhibition of Nebulin-related Anchoring Protein (Nrap, Accession NM\_139235), a gene which performs an anchoring function to link the terminal actin filaments of myofibrils to

protein complexes located beneath the sarcolemma. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nrap. The function of Nrap and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM649. Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM\_009699) is another VGAM1959 host target gene. NRIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRIP1 BINDING SITE, designated SEQ ID:30121, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67555] Another function of VGAM1959 is therefore inhibition of Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM\_009699), a gene which modulates transcriptional activation by the estrogen receptor. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRIP1.

The function of NRIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.8-oxoguanine DNA Glycosylase (OGG1, Accession NM\_016819) is another VGAM1959 host target gene. OGG1 BINDING SITE1 through OGG1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OGG1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGG1 BINDING SITE1 through OGG1 BINDING SITE3, designated SEQ ID:18811, SEQ ID:18816 and SEQ ID:8394 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67556] Another function of VGAM1959 is therefore inhibition of 8-oxoguanine DNA Glycosylase (OGG1, Accession NM\_016819), a gene which is involved in base excision DNA repair and removal of 8-oxyguanine. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGG1. The function of OGG1 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM390. Oncostatin M (OSM, Accession NM\_020530) is another VGAM1959 host target gene. OSM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSM BINDING SITE, designated SEQ ID:21754, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67557] Another function of VGAM1959 is therefore inhibition of Oncostatin M (OSM, Accession NM\_020530), a gene which inhibits the proliferation of a number of tumor cell lines, caused an acute inflammatory reaction. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSM. The function of OSM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1078. Pyrimidinergic Receptor P2Y, G-protein Coupled, 6 (P2RY6, Accession NM\_004154) is another VGAM1959 host target gene. P2RY6 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RY6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY6 BINDING SITE, designated SEQ ID:10355, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67558] Another function of VGAM1959 is therefore inhibition of Pyrimidinergic Receptor P2Y, G-protein Coupled, 6 (P2RY6, Accession NM\_004154), a gene which mediates cellular responses to nucleotides. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY6. The function of P2RY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM445. Protocadherin 11 X-linked (PCDH11X, Accession NM\_032968) is another VGAM1959 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING

SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26795 and SEQ ID:26810 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67559] Another function of VGAM1959 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM\_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433. Protocadherin 11 Y-linked (PCDH11Y, Accession NM\_032973) is another VGAM1959 host target gene. PCDH11Y BINDING SITE1 and PCDH11Y BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11Y, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING

SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11Y BINDING SITE1 and PCDH11Y BINDING SITE2, designated SEQ ID:26829 and SEQ ID:9851 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67560] Another function of VGAM1959 is therefore inhibition of Protocadherin 11 Y-linked (PCDH11Y, Accession NM\_032973). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11Y. Prohibitin (PHB, Accession NM\_002634) is another VGAM1959 host target gene. PHB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHB BINDING SITE, designated SEQ ID:8494, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67561] Another function of VGAM1959 is therefore inhibition of Prohibitin (PHB, Accession NM\_002634). Accordingly, utilities of VGAM1959 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PHB. PIG8 (Accession NM\_004879) is another VGAM1959 host target gene. PIG8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIG8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIG8 BINDING SITE, designated SEQ ID:11315, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67562] Another function of VGAM1959 is therefore inhibition of PIG8 (Accession NM\_004879), a gene which is induced by p53 and may be involved in apoptosis. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIG8. The function of PIG8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM737. Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646) is another VGAM1959 host target gene. PIK3C2B BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by PIK3C2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3C2B BINDING SITE, designated SEQ ID:8509, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67563] Another function of VGAM1959 is therefore inhibition of Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B. Polycystic Kidney Disease 1 (autosomal dominant) (PKD1, Accession NM\_000296) is another VGAM1959 host target gene. PKD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKD1 BINDING SITE, designated SEQ ID:5842, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67564] Another function of VGAM1959 is therefore inhibition of Polycystic Kidney Disease 1 (autosomal dominant) (PKD1, Accession NM\_000296). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD1. Phosphomannomutase 2 (PMM2, Accession XM\_050755) is another VGAM1959 host target gene. PMM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMM2 BINDING SITE, designated SEQ ID:35679, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67565] Another function of VGAM1959 is therefore inhibition of Phosphomannomutase 2 (PMM2, Accession XM\_050755). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMM2. Peroxisome Proliferative Activated Receptor, Gamma, Coactivator 1 (PPARGC1, Accession NM\_013261) is another VGAM1959 host target gene. PPARGC1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by PPARGC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPARGC1 BINDING SITE, designated SEQ ID:14932, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67566] Another function of VGAM1959 is therefore inhibition of Peroxisome Proliferative Activated Receptor, Gamma, Coactivator 1 (PPARGC1, Accession NM\_013261), a gene which may play a role in insulin sensitivity and thermogenesis. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPARGC1. The function of PPARGC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM952. Peptidyl-prolyl Isomerase G (cyclophilin G) (PPIG, Accession NM\_004792) is another VGAM1959 host target gene. PPIG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPIG, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIG BINDING SITE, designated SEQ ID:11202, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67567] Another function of VGAM1959 is therefore inhibition of Peptidyl–prolyl Isomerase G (cyclophilin G) (PPIG, Accession NM\_004792), a gene which catalyzes the cis–trans isomerization of proline imidic peptide bonds in oligopeptides. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIG. The function of PPIG has been established by previous studies. The peptidyl–prolyl cis/trans isomerase protein family (PPIases) includes the cyclophilin, FK506–binding protein (e.g., FKBP1A; 186945), and parvulin (e.g., PIN4, 300252) subfamilies. The cyclophilins have been implicated in the folding, transport, and assembly of proteins. Using a yeast 2–hybrid screen to identify proteins that interact with Clk (CLK1; 601951), Nestel et al. (1996) isolated partial clones of a mouse gene, which they called CARS–Cyp. By screening a thymus cDNA library with the mouse clone, they as–

sembled a full-length cDNA of the human homolog, PPIG. Using a yeast 2-hybrid screen to identify proteins that interact with the phosphorylated C-terminal domain (CTD) of the largest subunit of RNA polymerase II (POLR2A; 180660), Bourquin et al. (1997) independently cloned PPIG, which they called SRcyp/CASP10, from a B-lymphocyte cDNA library. PPIG is predicted to encode a 754-amino acid protein containing 2 Nopp140 (nucleolar phosphoprotein of 140 kD)-related domains and a large C-terminal serine/arginine (SR)-rich domain found predominantly in pre-mRNA splicing factors. The N-terminal region of PPIG contains a peptidyl-prolyl cis-trans isomerase domain characteristic of immunophilins/cyclophilins. PPIG shares 37.8% sequence identity with NKTR (OMIM Ref. No. 161565), a myeloid-specific nuclear protein. By Northern blot analysis, Nestel et al. (1996) detected PPIG expression at similar levels in lung, liver, kidney, small intestine, testis, and brain. They detected major 4-kb and minor 10-kb PPIG transcripts in human B-cell RNA. Although PPIG was widely expressed, it appeared to be absent from NK cells. By Northern blot analysis, Bourquin et al. (1997) detected a broadly expressed single 3.0-kb PPIG transcript. Using deletion mutant analysis,

Bourquin et al. (1997) determined that the SR domain of PPIG is required for interaction with the CTD of POLR2A in yeast 2-hybrid assays. Using GST fusion proteins, they confirmed that PPIG directly interacts with the CTD. Using immunostaining, they demonstrated that PPIG is distributed in nuclear speckles, a nuclear compartment rich in splicing factors, and colocalizes with the splicing factor SC35 (SFRS2; 600813). They concluded that PPIG may be a component of splicing factor complexes that bind the CTD, thereby linking RNA processing to transcription.

[67568] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67569] Bourquin, J.-P.; Stagljar, I.; Meier, P.; Moosmann, P.; Silke, J.; Baechi, T.; Georgiev, O.; Schaffner, W. : A serine/arginine-rich nuclear matrix cyclophilin interacts with the C-terminal domain of RNA polymerase II. *Nucleic Acids Res.* 25: 2055-2061, 1997. ; and

[67570] Nestel, F. P.; Colwill, K.; Harper, S.; Pawson, T.; Anderson, S. K. : RS cyclophilins: identification of an NK-TR(1)-related cyclophilin. *Gene* 180: 151-155, 1996.

[67571] Further studies establishing the function and utilities of PPIG are found in John Hopkins OMIM database record ID

606093, and in cited publications numbered 12399 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PR Domain Containing 4 (PRDM4, Accession NM\_012406) is another VGAM1959 host target gene. PRDM4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM4 BINDING SITE, designated SEQ ID:14785, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67572] Another function of VGAM1959 is therefore inhibition of PR Domain Containing 4 (PRDM4, Accession NM\_012406). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM4. PRex1 (Accession NM\_020820) is another VGAM1959 host target gene. PRex1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRex1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of PRex1 BINDING SITE, designated SEQ ID:21885, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67573] Another function of VGAM1959 is therefore inhibition of PRex1 (Accession NM\_020820). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRex1. Prokineticin 1 (PROK1, Accession NM\_032414) is another VGAM1959 host target gene. PROK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROK1 BINDING SITE, designated SEQ ID:26199, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67574] Another function of VGAM1959 is therefore inhibition of Prokineticin 1 (PROK1, Accession NM\_032414), a gene which induces proliferation, migration and fenestration in capillary endothelial cells derived from endocrine glands.

Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROK1. The function of PROK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1000. Prosaposin (variant Gaucher disease and variant metachromatic leukodystrophy) (PSAP, Accession XM\_045140) is another VGAM1959 host target gene. PSAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSAP BINDING SITE, designated SEQ ID:34373, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67575] Another function of VGAM1959 is therefore inhibition of Prosaposin (variant Gaucher disease and variant metachromatic leukodystrophy) (PSAP, Accession XM\_045140). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSAP. Prostaglandin F2 Re-

ceptor Negative Regulator (PTGFRN, Accession XM\_040709) is another VGAM1959 host target gene. PTGFRN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGFRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:33363, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67576] Another function of VGAM1959 is therefore inhibition of Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM\_040709), a gene which inhibits the binding of prostaglandin f2-alpha (pgf2- alpha) to its specific fp receptor. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFRN. The function of PTGFRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1,

Accession NM\_080591) is another VGAM1959 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:27901 and SEQ ID:6680 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67577] Another function of VGAM1959 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM\_080591), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. Protein Tyrosine Phosphatase,

Receptor Type, G (PTPRG, Accession NM\_002841) is another VGAM1959 host target gene. PTPRG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTPRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRG BINDING SITE, designated SEQ ID:8726, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67578] Another function of VGAM1959 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, G (PTPRG, Accession NM\_002841), a gene which is a candidate tumor suppressor and represents a subfamily of receptor tyrosine phosphatases. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRG. The function of PTPRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.RAD9 Homolog (*S. pombe*) (RAD9, Accession NM\_004584) is another VGAM1959 host target gene. RAD9 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by RAD9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD9 BINDING SITE, designated SEQ ID:10932, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67579] Another function of VGAM1959 is therefore inhibition of RAD9 Homolog (*S. pombe*) (RAD9, Accession NM\_004584), a gene which may function as a cell cycle checkpoint protein. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD9. The function of RAD9 has been established by previous studies. In *S. pombe*, rad9 is one of 6 genes essential for both the incomplete DNA replication (S-M) and DNA damage checkpoints. See HUS1 (OMIM Ref. No. 603760). By searching an EST database, Lieberman et al. (1996) identified a partial cDNA encoding HRAD9, a human rad9 homolog. The authors used the partial cDNA to recover additional human RAD9 cDNAs corresponding to the entire coding region. The predicted 391-amino acid human protein is 25% identical to *S. pombe* rad9. The human RAD9 gene par-

tially complemented the hydroxyurea sensitivity, radiosensitivity, and checkpoint defects of rad9-null mutant cells. On immunoblots of mammalian cell extracts, Volkmer and Karnitz (1999) found that human RAD9 migrated at 70 kD, even though it has a predicted molecular mass of 45 kD. The authors attributed this discrepancy to complex posttranslational modifications. In vivo, the human RAD9 protein was phosphorylated in response to DNA damage, suggesting that it participates in a DNA damage-inducible signaling pathway. Immunoprecipitation studies demonstrated that the fully modified form of RAD9 interacts selectively with RAD1 (OMIM Ref. No. 603153) and HUS1 in a stable complex. Volkmer and Karnitz (1999) concluded that these 3 proteins are central components of a DNA damage-responsive protein complex in human cells.

[67580] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67581] Lieberman, H. B.; Hopkins, K. M.; Nass, M.; Demetrick, D.; Davey, S. : A human homolog of the *Schizosaccharomyces pombe* rad9+ checkpoint control gene. *Proc. Nat. Acad. Sci.* 93: 13890–13895, 1996. ; and

[67582] Volkmer, E.; Karnitz, L. M. : Human homologs of Schizosaccharomyces pombe Rad1, Hus1, and Rad9 form a DNA damage-responsive protein complex. J. Biol. Chem. 274: 567–570, 1999.

[67583] Further studies establishing the function and utilities of RAD9 are found in John Hopkins OMIM database record ID 603761, and in cited publications numbered 7626 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RalA Binding Protein 1 (RALBP1, Accession NM\_006788) is another VGAM1959 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, designated SEQ ID:13659, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67584] Another function of VGAM1959 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM\_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xeno-

biotics. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345. RAN Binding Protein 3 (RANBP3, Accession NM\_007321) is another VGAM1959 host target gene. RANBP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RANBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP3 BINDING SITE, designated SEQ ID:14237, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67585] Another function of VGAM1959 is therefore inhibition of RAN Binding Protein 3 (RANBP3, Accession NM\_007321). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP3. Ras Association (RalGDS/AF-6) Domain Family 1 (RASSF1, Accession NM\_007182) is another VGAM1959 host target gene.

RASSF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASSF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF1 BINDING SITE, designated SEQ ID:14038, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67586] Another function of VGAM1959 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 1 (RASSF1, Accession NM\_007182), a gene which is a candidate renal tumor suppressor. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF1. The function of RASSF1 has been established by previous studies. Allelic loss at the short arm of chromosome 3 is one of the most common and earliest events in the pathogenesis of lung cancer, and is observed in more than 90% of small cell lung cancers (SCLCs) and in 50 to 80% of non-small cell lung cancers (OMIM Ref. No. NSCLCs). Frequent and early loss of heterozygosity and the presence of homozygous deletions suggested a critical role of the region 3p21.3 in

tumorigenesis, and a region of common homozygous deletion in 3p21.3 was narrowed to 120 kb by Sekido et al. (1998). Several putative tumor-suppressor genes located at 3p21 had been characterized, but none of these appeared to be altered in lung cancer. Dammann et al. (2000) described the cloning and characterization of a human RAS effector homolog, RASSF1, located in the 120-kb region of minimal homozygous deletion. They identified the RASSF1 protein through its interaction with the human DNA repair protein XPA (OMIM Ref. No. 278700) in a yeast 2-hybrid screen. Dammann et al. (2000) detected 3 transcripts, A, B, and C, derived from alternative splicing and promoter usage. The major transcripts A and C were expressed in all normal tissues tested. Transcript A was missing in all SCLC cell lines analyzed and in several other cancer cell lines. Loss of expression was correlated with methylation of the CpG island promoter sequence of RASSF1A. The promoter was highly methylated in 24 of 60 (40%) primary lung tumors, and 4 of 41 tumors analyzed carried missense mutations. Reexpression of transcript A in lung carcinoma cells reduced colony formation, suppressed anchorage-independent growth, and inhibited tumor formation in nude mice. These characteristics indi-

cated a potential role for RASSF1A as a lung tumor suppressor. Dammann et al. (2000) found no mutations in 17 SCLC cell lines, but found 4 missense mutations in 41 primary NSCLCs.

[67587] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67588] Dammann, R.; Li, C.; Yoon, J.-H.; Chin, P. L.; Bates, S.; Pfeifer, G. P. : Epigenetic inactivation of a RAS association domain family protein from the lung tumour suppressor locus 3p21.3. *Nature Genet.* 25: 315–319, 2000. ; and

[67589] Sekido, Y.; Ahmadian, M.; Wistuba, I. I.; Latif, F.; Bader, S.; Wei, M.-H.; Duh, F.-M.; Gazdar, A. F.; Lerman, M. I.; Minna, J. D. : Cloning of a breast cancer homozygous deletion jun.

[67590] Further studies establishing the function and utilities of RASSF1 are found in John Hopkins OMIM database record ID 605082, and in cited publications numbered 6597–6599, 10 and 6600 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinoblastoma Binding Protein 5 (RBBP5, Accession NM\_005057) is another VGAM1959 host target gene. RBBP5 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by RBBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP5 BINDING SITE, designated SEQ ID:11486, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67591] Another function of VGAM1959 is therefore inhibition of Retinoblastoma Binding Protein 5 (RBBP5, Accession NM\_005057). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP5. Regulator of Non-sense Transcripts 1 (RENT1, Accession NM\_002911) is another VGAM1959 host target gene. RENT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RENT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RENT1 BINDING SITE, designated SEQ ID:8814, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67592] Another function of VGAM1959 is therefore inhibition of Regulator of Nonsense Transcripts 1 (RENT1, Accession NM\_002911), a gene which eliminates the production of nonsense-containing RNAs in mammalian cells. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RENT1. The function of RENT1 has been established by previous studies. Sun et al. (1998) provided evidence for a factor that functions to eliminate the production of nonsense-containing RNAs in mammalian cells. They identified the factor, variously referred to as RENT1 and HUPF1, by isolating cDNA for a human homolog of *S. cerevisiae* Upf1p, which is a group I RNA helicase that functions in the nonsense-mediated decay of mRNA in yeast. Using monkey COS cells and human HeLa cells, Sun et al. (1998) demonstrated that expression of human Upf1 protein harboring an arginine-to-cysteine mutation at residue 844 within the RNA helicase domain acts in a dominant-negative fashion to abrogate the decay of nonsense-containing mRNA that takes place in association with nuclei or in the cytoplasm. These findings provided evidence that nonsense-mediated mRNA decay is related mechanistically in yeast and in mammalian cells, regard-

less of the cellular site of decay. Animal model experiments lend further support to the function of RENT1. Medghalchi et al. (2001) explored the consequences of loss of NMRD function in vertebrates through targeted disruption of the *Rent1* gene, which encodes a mammalian ortholog of Upf1p, in murine embryonic stem cells. Mice heterozygous for the targeted allele showed no apparent phenotypic abnormalities but homozygosity was never observed, demonstrating that *Rent1* is essential for embryonic viability. Homozygous targeted embryos showed complete loss of NMRD and were viable in the preimplantation period, but resorbed shortly after implantation. Furthermore, *Rent1*  $-/-$  blastocysts isolated at 3.5 days postcoitum underwent apoptosis in culture following a brief phase of cellular expansion. The authors hypothesized that NMRD is essential for mammalian cellular viability and supports a critical role for the pathway in the regulated expression of selected physiologic transcripts.

[67593] It is appreciated that the abovementioned animal model for RENT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[67594] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [67595] Sun, X.; Perlick, H. A.; Dietz, H. C.; Maquat, L. E. : A mutated human homologue to yeast Upf1 protein has a dominant-negative effect on the decay of nonsense-containing mRNAs in mammalian cells. *Proc. Nat. Acad. Sci.* 95: 10009–10014, 1998. ; and
- [67596] Medghalchi, S. M.; Frischmeyer, P. A.; Mendell, J. T.; Kelly, A. G.; Lawler, A. M.; Dietz, H. C. : Rent1, a trans-effector of nonsense-mediated mRNA decay, is essential for mammalian em.
- [67597] Further studies establishing the function and utilities of RENT1 are found in John Hopkins OMIM database record ID 601430, and in cited publications numbered 9277–9282 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Regulator of G-protein Signalling 3 (RGS3, Accession NM\_144488) is another VGAM1959 host target gene. RGS3 BINDING SITE1 through RGS3 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RGS3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RGS3 BINDING SITE1 through RGS3 BINDING SITE6, designated SEQ ID:29306, SEQ ID:29308, SEQ ID:28282, SEQ ID:28668, SEQ ID:19423 and SEQ ID:22088 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67598] Another function of VGAM1959 is therefore inhibition of Regulator of G-protein Signalling 3 (RGS3, Accession NM\_144488), a gene which negatively regulates G protein-coupled receptor signalling. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS3. The function of RGS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM404.RP42 (Accession NM\_020640) is another VGAM1959 host target gene. RP42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP42 BINDING SITE, designated SEQ ID:21803, to the nucleotide sequence of

VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67599] Another function of VGAM1959 is therefore inhibition of RP42 (Accession NM\_020640), a gene which not clear yet. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP42. The function of RP42 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47. Ribulose-5-phosphate-3-epimerase (RPE, Accession XM\_030834) is another VGAM1959 host target gene. RPE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPE BINDING SITE, designated SEQ ID:31153, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67600] Another function of VGAM1959 is therefore inhibition of Ribulose-5-phosphate-3-epimerase (RPE, Accession XM\_030834). Accordingly, utilities of VGAM1959 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RPE. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063) is another VGAM1959 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11499, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67601] Another function of VGAM1959 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM\_114281) is an-

other VGAM1959 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42834, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67602] Another function of VGAM1959 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM\_114281). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A. Succinate Dehydrogenase Complex, Subunit D, Integral Membrane Protein (SDHD, Accession NM\_003002) is another VGAM1959 host target gene. SDHD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDHD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDHD BINDING SITE, designated SEQ ID:8896, to the nucleotide se-

quence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67603] Another function of VGAM1959 is therefore inhibition of Succinate Dehydrogenase Complex, Subunit D, Integral Membrane Protein (SDHD, Accession NM\_003002). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDHD. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 5 (SERPINB5, Accession NM\_002639) is another VGAM1959 host target gene. SERPINB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB5 BINDING SITE, designated SEQ ID:8495, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67604] Another function of VGAM1959 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 5 (SERPINB5, Accession NM\_002639), a gene which may be a serpin serine pro-

tease inhibitor and suppresses tumor metastasis. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB5. The function of SERPINB5 has been established by previous studies. The nucleotide 5-methylcytosine is involved in processes crucial to mammalian development, such as X-chromosome inactivation and gene imprinting. In addition, cytosine methylation may be involved in the establishment and maintenance of cell type-specific expression of developmentally regulated genes; however, it is difficult to identify clear examples of such genes, particularly in humans. Futscher et al. (2002) provided evidence that cytosine methylation of the maspin gene promoter controls, in part, normal cell type-specific SERPINB5 expression. In normal cells expressing SERPINB5, the SERPINB5 promoter is unmethylated and the promoter region has acetylated histones and an accessible chromatin structure. In contrast, normal cells that do not express SERPINB5 have a completely methylated SERPINB5 promoter with hypoacetylated histones, an inaccessible chromatin structure, and a transcriptional repression that is relieved by inhibition of DNA methylation. These findings indicated that cytosine methylation is important in

the establishment and maintenance of cell type–restricted gene expression. Zou et al. (1994) used subtractive hybridization and the 'differential display' method to identify candidate tumor suppressor genes that are defective in human breast carcinoma cells. These genes were identified initially by searching for mRNAs whose expression is reduced or absent in tumor cells compared with normal cells grown under similar conditions. Zou et al. (1994) reported the characteristics of one of the more than 30 genes so identified, a member of the serpin family of protease inhibitors which they termed maspin. A single 3.0–kb maspin mRNA was expressed in normal mammary epithelial cell strains, but not in most mammary tumor cell lines examined. Southern blot analysis of XbaI–restricted DNA from normal and tumor cells with a maspin cDNA probe revealed no gross structural alterations of the maspin gene in the tumor cells. This result suggested that the maspin gene is downregulated but not mutated in cancer cells. Transfection of mammary carcinoma cells with the maspin gene did not alter the growth properties of the cells in vitro, but reduced their ability to induce tumors and metastasize in nude mice and to invade through a basement membrane matrix in vitro. Analysis of human

breast cancer specimens demonstrated that loss of maspin expression occurred most frequently in advanced cancers. These results supported the hypothesis that maspin functions as a tumor suppressor.

[67605] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67606] Zou, Z.; Anisowicz, A.; Hendrix, M. J. C.; Thor, A.; Neveu, M.; Sheng, S.; Rafidi, K.; Seftor, E.; Sager, R. : Maspin, a serpin with tumor-suppressing activity in human mammary epithelial cells. Science 263: 526–529, 1994. ; and

[67607] Futscher, B. W.; Oshiro, M. M.; Wozniak, R. J.; Holtan, N.; Hanigan, C. L.; Duan, H.; Domann, F. E. : Role for DNA methylation in the control of cell type-specific maspin expression. Nat.

[67608] Further studies establishing the function and utilities of SERPINB5 are found in John Hopkins OMIM database record ID 154790, and in cited publications numbered 2962–2963, 36 and 2964 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Splicing Factor 1 (SF1, Accession NM\_004630) is another VGAM1959 host target gene. SF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by SF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SF1 BINDING SITE, designated SEQ ID:11001, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67609] Another function of VGAM1959 is therefore inhibition of Splicing Factor 1 (SF1, Accession NM\_004630), a gene which is a transcriptional repressor and splicing factor. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SF1. The function of SF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM934. SH3-domain Binding Protein 2 (SH3BP2, Accession NM\_003023) is another VGAM1959 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP2

BINDING SITE, designated SEQ ID:8951, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67610] Another function of VGAM1959 is therefore inhibition of SH3-domain Binding Protein 2 (SH3BP2, Accession NM\_003023). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2. Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM\_005069) is another VGAM1959 host target gene. SIM2 BINDING SITE1 and SIM2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SIM2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM2 BINDING SITE1 and SIM2 BINDING SITE2, designated SEQ ID:11518 and SEQ ID:14311 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67611] Another function of VGAM1959 is therefore inhibition of Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM\_005069), a gene which may be a master gene of cns development. Accordingly, utilities of VGAM1959 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM2. The function of SIM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM369. Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM\_005628) is another VGAM1959 host target gene. SLC1A5 BINDING SITE1 and SLC1A5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC1A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A5 BINDING SITE1 and SLC1A5 BINDING SITE2, designated SEQ ID:12144 and SEQ ID:9525 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67612] Another function of VGAM1959 is therefore inhibition of Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM\_005628). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A5. Solute Carrier Family 7 (cationic amino acid

transporter,  $\gamma^+$  system), Member 6 (SLC7A6, Accession NM\_003983) is another VGAM1959 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10133, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67613] Another function of VGAM1959 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 6 (SLC7A6, Accession NM\_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87.SRY (sex determining region Y)-box 12 (SOX12, Accession NM\_006943) is another VGAM1959 host target gene.

SOX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX12 BINDING SITE, designated SEQ ID:13831, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67614] Another function of VGAM1959 is therefore inhibition of SRY (sex determining region Y)-box 12 (SOX12, Accession NM\_006943). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX12. SRGAP2 (Accession XM\_059095) is another VGAM1959 host target gene. SRGAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRGAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRGAP2 BINDING SITE, designated SEQ ID:36879, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ

ID:4670.

[67615] Another function of VGAM1959 is therefore inhibition of SRGAP2 (Accession XM\_059095). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRGAP2. Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 1 (STAM, Accession NM\_003473) is another VGAM1959 host target gene. STAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAM BINDING SITE, designated SEQ ID:9542, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67616] Another function of VGAM1959 is therefore inhibition of Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 1 (STAM, Accession NM\_003473), a gene which is as an adaptor molecule involved in the downstream signaling of cytokine receptors. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with STAM. The function of STAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM927. Suppressor of Ty 6 Homolog (*S. cerevisiae*) (SUPT6H, Accession XM\_017037) is another VGAM1959 host target gene. SUPT6H BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SUPT6H, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUPT6H BINDING SITE, designated SEQ ID:30293, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67617] Another function of VGAM1959 is therefore inhibition of Suppressor of Ty 6 Homolog (*S. cerevisiae*) (SUPT6H, Accession XM\_017037), a gene which may normally act to repress transcription at a variety of loci, and also plays a role in chromatin structure or assembly. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUPT6H. The function of SUPT6H has been established by previous studies. Chiang et al. (1996) isolated

and sequenced SUPT6H and Supt6h, the human and murine homologs of the *Saccharomyces cerevisiae* and *Caenorhabditis elegans* genes SPT6 and emb-5, respectively. The human and murine SPT6 homologs are virtually identical, as they share more than 98% identity and more than 99% similarity at the protein level. The derived amino acid sequences of these 2 genes predicted a 1,603-amino acid polypeptide in human and a 1,726-amino acid polypeptide in mouse, respectively. The proteins have a highly acidic 5-prime region, a degenerate SH2 domain, and a leucine zipper, features consistent with a nuclear protein that regulates transcription. Northern blotting revealed a 7.0-kb transcript that was expressed constitutively in both mouse and human. Chiang et al. (1996) commented that SUPT6H appears to be functionally analogous to SPT6 and emb-5 and may therefore regulate transcription through establishment or maintenance of chromatin structure. By PCR-based analysis of somatic cell hybrids and by fluorescence in situ hybridization, Chiang et al. (1996) mapped the human homolog to 17q11.2. Segre et al. (1995) detected a cDNA fragment from the Supt6h gene on a mouse YAC that also contained the 'nude' locus. Their data placed Supt6h approximately 100

kb from whn (OMIM Ref. No. 600838), which is located on mouse chromosome 11. Thus, the Supt6h gene was mapped to mouse chromosome 11B1, which exhibits extensive homology of synteny with proximal human 17q.

[67618] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67619] Chiang, P.-W.; Wang, S.; Smithivas, P.; Song, W.-J.; Rammamoorthy, S.; Hillman, J.; Puett, S.; Van Keuren, M. L.; Crombez, E.; Kumar, A.; Glover, T. W.; Miller, D. E.; Tsai, C.-H.; Blackburn, C. C.; Chen, X.-N.; Sun, Z.; Cheng, J.-F.; Korenberg, J. R.; Kurnit, D. M. : Identification and analysis of the human and murine putative chromatin structure regulator SUPT6H and Supt6h. Genomics 34: 328–333, 1996. ; and

[67621] Further studies establishing the function and utilities of SUPT6H are found in John Hopkins OMIM database record ID 601333, and in cited publications numbered 9480–9481 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. TATA Box Binding Protein (TBP)–associated Factor, RNA Polymerase I, C, 110kDa (TAF1C, Accession NM\_005679) is another VGAM1959 host target gene. TAF1C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TAF1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF1C BINDING SITE, designated SEQ ID:12237, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67622] Another function of VGAM1959 is therefore inhibition of TATA Box Binding Protein (TBP)–associated Factor, RNA Polymerase I, C, 110kDa (TAF1C, Accession NM\_005679), a gene which belongs to component of the RNA polymerase I and II SL1 transcription factor. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF1C. The function of TAF1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. TAF7 RNA Polymerase II, TATA

Box Binding Protein (TBP)–associated Factor, 55kDa (TAF7, Accession NM\_005642) is another VGAM1959 host target gene. TAF7 BINDING SITE1 and TAF7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TAF7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF7 BINDING SITE1 and TAF7 BINDING SITE2, designated SEQ ID:12175 and SEQ ID:12177 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67623] Another function of VGAM1959 is therefore inhibition of TAF7 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 55kDa (TAF7, Accession NM\_005642), a gene which may function as a coactivator of transcription with some activators. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF7. The function of TAF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1316. Transcription Factor 2, Hepatic; LF-B3;

Variant Hepatic Nuclear Factor (TCF2, Accession NM\_006481) is another VGAM1959 host target gene. TCF2 BINDING SITE1 and TCF2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCF2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE1 and TCF2 BINDING SITE2, designated SEQ ID:13204 and SEQ ID:13205 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67624] Another function of VGAM1959 is therefore inhibition of Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM\_006481), a gene which probably binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF2. The function of TCF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118. Transcription Factor 4 (TCF4, Accession

NM\_003199) is another VGAM1959 host target gene.

TCF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TCF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF4 BINDING SITE, designated SEQ ID:9187, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67625] Another function of VGAM1959 is therefore inhibition of Transcription Factor 4 (TCF4, Accession NM\_003199), a gene which is a transcriptional activator; interacts with ITF1 (TCF3); and contains basic helix-loop-helix domain. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF4. The function of TCF4 has been established by previous studies. The high mobility group (HMG) box is a DNA-binding domain. TCF7 (OMIM Ref. No. 189908), also called TCF1, and LEF1 (OMIM Ref. No. 153245), also called TCF1-alpha, are human lymphoid transcription factors that contain a virtually identical HMG box. By PCR of human genomic DNA using degenerate oligonucleotides based on the HMG boxes of TCF7 and

LEF1, Castrop et al. (1992) identified the TCF7L1 (OMIM Ref. No. 604652) and TCF7L2 genes, which they called TCF3 and TCF4, respectively. TCF7L1 and TCF7L2 were not expressed in cells of the lymphoid lineage. The deduced amino acid sequences of the HMG boxes of TCF7L1, TCF7L2, and TCF7 show striking homology. The authors suggested the existence of a subfamily of TCF7-like HMG box-containing transcription factors. Animal model experiments lend further support to the function of TCF4. To study the physiologic role of Tcf4 (which is encoded by the Tcf7l2 gene), Korinek et al. (1998) disrupted Tcf7l2 by homologous recombination. The homozygous null mice died shortly after birth. A single histopathologic abnormality was observed. An apparently normal transition of intestinal endoderm into epithelium occurred at approximately embryonic day (E) 14.5. However, no proliferative compartments were maintained in the prospective crypt regions between the villi. As a consequence, the neonatal epithelium was composed entirely of differentiated, nondividing villus cells. Korinek et al. (1998) concluded that the genetic program controlled by Tcf7l2 maintains the crypt stem cells of the small intestine. The constitutive activity of Tcf4 in APC-deficient ep-

ithelial cells may contribute to their malignant transformation by maintaining stem cell characteristics.

[67626] It is appreciated that the abovementioned animal model for TCF4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[67627] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67628] Castrop, J.; van Norren, K.; Clevers, H. : A gene family of HMG-box transcription factors with homology to TCF-1. Nucleic Acids Res. 20: 611 only, 1992. ; and

[67629] Korinek, V.; Barker, N.; Moerer, P.; van Donselaar, E.; Huls, G.; Peters, P. J.; Clevers, H. : Depletion of epithelial stem-cell compartments in the small intestine of mice lacking Tcf-4.

[67630] Further studies establishing the function and utilities of TCF4 are found in John Hopkins OMIM database record ID 602228, and in cited publications numbered 5893-589 and 2303-2305 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. T-cell, Immune Regulator 1, ATPase, H<sup>+</sup> Transporting, Lysosomal V0 Protein A Isoform 3 (TCIRG1, Accession

NM\_006053) is another VGAM1959 host target gene.

TCIRG1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TCIRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCIRG1 BINDING SITE, designated SEQ ID:12690, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67631] Another function of VGAM1959 is therefore inhibition of T-cell, Immune Regulator 1, ATPase, H<sup>+</sup> Transporting, Lysosomal V0 Protein A Isoform 3 (TCIRG1, Accession NM\_006053), a gene which seems to be directly involved in t cell activation. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCIRG1. The function of TCIRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1707. Thyroid Hormone Receptor, Alpha (erythroblastic leukemia viral (v-erb-a) Oncogene Homolog, Avian) (THRA, Accession NM\_003250) is another

VGAM1959 host target gene. THRA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by THRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THRA BINDING SITE, designated SEQ ID:9258, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67632] Another function of VGAM1959 is therefore inhibition of Thyroid Hormone Receptor, Alpha (erythroblastic leukemia viral (v-erb-a) Oncogene Homolog, Avian) (THRA, Accession NM\_003250), a gene which is a high affinity receptor for thyroid hormone. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THRA. The function of THRA has been established by previous studies. Debuire et al. (1984) found that ERBA, which potentiates ERBB (OMIM Ref. No. 131550), has an amino acid sequence different from that of other known oncogene products and related to those of the carbonic anhydrases. ERBA potentiates ERBB by blocking differentiation of erythroblasts at an immature stage. Carbonic anhydrases

participate in the transport of carbon dioxide in erythrocytes. Sap et al. (1986) and Weinberger et al. (1986) showed that the ERBA protein is a high-affinity receptor for thyroid hormone. The cDNA sequence indicates a relationship to steroid-hormone receptors, and binding studies indicate that it is a receptor for thyroid hormones. It is located in the nucleus, where it binds to DNA and activates transcription. McCabe et al. (1999) hypothesized that aberrant THRA expression in nonfunctioning pituitary tumors may reflect mutations in the receptor coding and regulatory sequences. They screened THRA mRNA and THRB response elements and ligand-binding domains for sequence anomalies. Screening THRA mRNA from 23 tumors by RNase mismatch and sequencing candidate fragments identified 1 silent and 3 missense mutations, 2 in the common THRA region (190120.0001, 190120.0002) and 1 that was specific for the alpha-2 isoform (190120.0003). No THRB response element differences were detected in 14 nonfunctioning tumors, and no THRB ligand-binding domain differences were detected in 23 nonfunctioning tumors. The authors suggested that the novel thyroid receptor mutations may be of functional significance in terms of thyroid receptor action, and fur-

ther definition of their functional properties may provide insight into the role of thyroid receptors in growth control in pituitary cells. Animal model experiments lend further support to the function of THRA. To evaluate the respective contributions of THRA and THRB in the regulation of CYP7A (OMIM Ref. No. 118455), the rate-limiting enzyme in the synthesis of bile acids, Gullberg et al. (2000) studied the responses to 2% dietary cholesterol and T3 in THRA and THRB knockout mice under hypo- and hyperthyroid conditions. Their experiments showed that the normal stimulation in CYP7A activity and mRNA level by T3 is lost in THRB  $-/-$ , but not in THRA  $-/-$ , mice, identifying THRB as the mediator of T3 action on CYP7A and, consequently, as a major regulator of cholesterol metabolism in vivo. Somewhat unexpectedly, T3-deficient THRB  $-/-$  mice showed an augmented CYP7A response after challenge with dietary cholesterol, and these animals did not develop hypercholesterolemia to the extent that wildtype controls did. The authors concluded that the latter results lend strong support to the concept that THRs may exert regulatory effects in vivo independent of T3.

[67633] It is appreciated that the abovementioned animal model for THRA is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[67634] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67635] Weinberger, C.; Thompson, C. C.; Ong, E. S.; Lebo, R.; Gruol, D. J.; Evans, R. M. : The c-erb-A gene encodes a thyroid hormone receptor. Nature 324: 641–646, 1986. ; and

[67636] Gullberg, H.; Rudling, M.; Forrest, D.; Angelin, B.; Vennstrom, B. : Thyroid hormone receptor beta-deficient mice show complete loss of the normal cholesterol 7-alpha-hydroxylase (CYP7A).

[67637] Further studies establishing the function and utilities of THRA are found in John Hopkins OMIM database record ID 190120, and in sited publications numbered 11591–9823, 10340, 1074 and 10569–10571 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TIC (Accession NM\_012455) is another VGAM1959 host target gene. TIC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIC, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIC BINDING SITE, designated SEQ ID:14830, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67638] Another function of VGAM1959 is therefore inhibition of TIC (Accession NM\_012455). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIC. TIM3 (Accession NM\_032782) is another VGAM1959 host target gene. TIM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIM3 BINDING SITE, designated SEQ ID:26526, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67639] Another function of VGAM1959 is therefore inhibition of TIM3 (Accession NM\_032782), a gene which regulates macrophage activation and enhances the severity of experimental autoimmune encephalomyelitis in mice. Ac-

cordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIM3. The function of TIM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM909. Translocase of Outer Mitochondrial Membrane 22 Homolog (yeast) (TOMM22, Accession NM\_020243) is another VGAM1959 host target gene. TOMM22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOMM22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOMM22 BINDING SITE, designated SEQ ID:21517, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67640] Another function of VGAM1959 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 22 Homolog (yeast) (TOMM22, Accession NM\_020243). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM22. Topoisomerase (DNA) III Beta (TOP3B,

Accession NM\_003935) is another VGAM1959 host target gene. TOP3B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TOP3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOP3B BINDING SITE, designated SEQ ID:10039, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67641] Another function of VGAM1959 is therefore inhibition of Topoisomerase (DNA) III Beta (TOP3B, Accession NM\_003935). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOP3B. Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163) is another VGAM1959 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17520, to the nucleotide sequence of

VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67642] Another function of VGAM1959 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662) is another VGAM1959 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19199, to the nucleotide sequence of

VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67643] Another function of VGAM1959 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347) is another VGAM1959 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9358, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67644] Another function of VGAM1959 is therefore inhibition of Ubiquitin–conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215. Ubiquitin–conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM\_003349) is another VGAM1959 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE6, designated SEQ ID:9370, SEQ ID:9372, SEQ ID:22769, SEQ ID:22771, SEQ ID:22522 and SEQ ID:22524 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67645] Another function of VGAM1959 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM\_003349), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155. Ubiquitin Specific Protease 11 (USP11, Accession NM\_004651) is another VGAM1959 host target gene. USP11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by USP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP11 BINDING SITE, designated SEQ ID:11020, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67646] Another function of VGAM1959 is therefore inhibition of Ubiquitin Specific Protease 11 (USP11, Accession NM\_004651), a gene which removes ubiquitin from ubiq-

uitin-conjugated proteins. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP11. The function of USP11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM429. Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM\_049695) is another VGAM1959 host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35478, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67647] Another function of VGAM1959 is therefore inhibition of Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM\_049695), a gene which may take part in defining the lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with VANGL2. The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111. Vasoactive Intestinal Peptide Receptor 2 (VIPR2, Accession NM\_003382) is another VGAM1959 host target gene. VIPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VIPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIPR2 BINDING SITE, designated SEQ ID:9413, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67648] Another function of VGAM1959 is therefore inhibition of Vasoactive Intestinal Peptide Receptor 2 (VIPR2, Accession NM\_003382). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR2. Very Low Density Lipoprotein Receptor (VLDLR, Accession XM\_045386) is another VGAM1959 host target gene. VLDLR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VLDLR, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VLDLR BINDING SITE, designated SEQ ID:34451, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67649] Another function of VGAM1959 is therefore inhibition of Very Low Density Lipoprotein Receptor (VLDLR, Accession XM\_045386), a gene which may play a crucial role in triglyceride metabolism. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VLDLR. The function of VLDLR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM103.WWP2 (Accession XM\_028151) is another VGAM1959 host target gene. WWP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WWP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWP2 BINDING SITE, designated SEQ ID:30623, to the nucleotide sequence of

VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67650] Another function of VGAM1959 is therefore inhibition of WWP2 (Accession XM\_028151), a gene which exhibits ubiquitin-protein ligase activity and contains WW and HECT domains. Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWP2. The function of WWP2 has been established by previous studies. The WW domain is a protein motif consisting of 35 to 40 amino acids and is characterized by 4 conserved aromatic residues, 2 of which are tryptophan. Pirozzi et al. (1997) suggested that WW domains mediate specific protein-protein interactions. Pirozzi et al. (1997) identified WWP2 by screening for WW-domain containing proteins (see OMIM Ref. No. WWP1; 602307). WWP2 contains 4 tandem WW domains, a complete HECT (homologous to the E6-associated protein carboxyl terminus) domain, associated with ubiquitin-protein ligase activity, and a C2 (calcium-dependent phospholipid-binding)-like domain characteristic of a large family of proteins including protein kinase C (see OMIM Ref. No. 176960). Based on similarities in structure between NEDD4 (OMIM Ref. No.

602278) and WWP2, Pirozzi et al. (1997) suggested that WWP2 belongs to a family of NEDD4-like proteins. Using in vitro assays, Pirozzi et al. (1997) showed that individual WW domains can selectively bind particular peptide ligands. By Northern blot analysis, Wood et al. (1998) detected a 5-kb WWP2 transcript in heart, brain, placenta, lung, liver, muscle, kidney, pancreas. Using yeast 2-hybrid and in vitro binding studies, Wood et al. (1998) demonstrated that WWP2, which they called AIP2, binds to atrophin-1 (DRPLA; 125370).

[67651] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[67652] Pirozzi, G.; McConnell, S. J.; Uveges, A. J.; Carter, J. M.; Sparks, A. B.; Kay, B. K.; Fowlkes, D. M. : Identification of novel human WW domain-containing proteins by cloning of ligand targets. *J. Biol. Chem.* 272: 14611-14616, 1997.  
; and

[67653] Wood, J. D.; Yuan, J.; Margolis, R. L.; Colomer, V.; Duan, K.; Kushi, J.; Kaminsky, Z.; Kleiderlein, J. J., Jr.; Sharp, A. H.; Ross, C. A. : Atrophin-1, the DRPLA gene product, interacts.

[67654] Further studies establishing the function and utilities of

WWP2 are found in John Hopkins OMIM database record ID 602308, and in cited publications numbered 5898 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 132 (clone pHZ-12) (ZNF132, Accession NM\_003433) is another VGAM1959 host target gene. ZNF132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF132 BINDING SITE, designated SEQ ID:9485, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67655] Another function of VGAM1959 is therefore inhibition of Zinc Finger Protein 132 (clone pHZ-12) (ZNF132, Accession NM\_003433). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF132. Zinc Finger Protein 24 (KOX 17) (ZNF24, Accession NM\_006965) is another VGAM1959 host target gene. ZNF24 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF24, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF24 BINDING SITE, designated SEQ ID:13839, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67656] Another function of VGAM1959 is therefore inhibition of Zinc Finger Protein 24 (KOX 17) (ZNF24, Accession NM\_006965). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF24. Zinc Finger Protein 266 (ZNF266, Accession XM\_113992) is another VGAM1959 host target gene. ZNF266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF266 BINDING SITE, designated SEQ ID:42601, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67657] Another function of VGAM1959 is therefore inhibition of Zinc Finger Protein 266 (ZNF266, Accession XM\_113992).

Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF266. Zinc Finger Protein 268 (ZNF268, Accession XM\_031851) is another VGAM1959 host target gene. ZNF268 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF268 BINDING SITE, designated SEQ ID:31502, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67658] Another function of VGAM1959 is therefore inhibition of Zinc Finger Protein 268 (ZNF268, Accession XM\_031851). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF268. Zinc Finger Protein 35 (clone HF.10) (ZNF35, Accession NM\_003420) is another VGAM1959 host target gene. ZNF35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF35 BINDING SITE, designated SEQ ID:9464, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67659] Another function of VGAM1959 is therefore inhibition of Zinc Finger Protein 35 (clone HF.10) (ZNF35, Accession NM\_003420). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF35. Alpha 1,4-galactosyltransferase (A4GALT, Accession NM\_017436) is another VGAM1959 host target gene. A4GALT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by A4GALT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A4GALT BINDING SITE, designated SEQ ID:18895, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67660] Another function of VGAM1959 is therefore inhibition of Alpha 1,4-galactosyltransferase (A4GALT, Accession

NM\_017436). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A4GALT. Acetyl-Coenzyme A Synthetase 2 (ADP forming) (ACAS2, Accession NM\_139274) is another VGAM1959 host target gene. ACAS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ACAS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACAS2 BINDING SITE, designated SEQ ID:29265, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67661] Another function of VGAM1959 is therefore inhibition of Acetyl-Coenzyme A Synthetase 2 (ADP forming) (ACAS2, Accession NM\_139274). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACAS2. ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM\_031949) is another VGAM1959 host target gene. ACTR1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by ACTR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR1A BINDING SITE, designated SEQ ID:31534, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67662] Another function of VGAM1959 is therefore inhibition of ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM\_031949). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR1A. AF053356\_CDS3 (Accession NM\_023948) is another VGAM1959 host target gene. AF053356\_CDS3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AF053356\_CDS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF053356\_CDS3 BINDING SITE, designated SEQ ID:23428, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67663] Another function of VGAM1959 is therefore inhibition of AF053356\_CDS3 (Accession NM\_023948). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF053356\_CDS3. A Kinase (PRKA) Anchor Protein 7 (AKAP7, Accession NM\_004842) is another VGAM1959 host target gene. AKAP7 BINDING SITE1 through AKAP7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP7 BINDING SITE1 through AKAP7 BINDING SITE3, designated SEQ ID:11254, SEQ ID:28907 and SEQ ID:18517 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67664] Another function of VGAM1959 is therefore inhibition of A Kinase (PRKA) Anchor Protein 7 (AKAP7, Accession NM\_004842). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP7. Adaptor-related Protein Complex 3, Delta 1 Subunit (AP3D1, Accession

NM\_003938) is another VGAM1959 host target gene.

AP3D1 BINDING SITE1 and AP3D1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AP3D1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3D1 BINDING SITE1 and AP3D1 BINDING SITE2, designated SEQ ID:10045 and SEQ ID:10050 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67665] Another function of VGAM1959 is therefore inhibition of Adaptor-related Protein Complex 3, Delta 1 Subunit (AP3D1, Accession NM\_003938). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3D1. Apoptosis Inhibitor 5 (API5, Accession NM\_006595) is another VGAM1959 host target gene. API5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by API5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of API5 BINDING

SITE, designated SEQ ID:13360, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67666] Another function of VGAM1959 is therefore inhibition of Apoptosis Inhibitor 5 (API5, Accession NM\_006595). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with API5. APOARGC (Accession NM\_024492) is another VGAM1959 host target gene. APOARGC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOARGC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOARGC BINDING SITE, designated SEQ ID:23690, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67667] Another function of VGAM1959 is therefore inhibition of APOARGC (Accession NM\_024492). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOARGC. Apolipoprotein L, 3 (APOL3, Accession NM\_014349) is another VGAM1959 host target gene.

APOL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL3 BINDING SITE, designated SEQ ID:15675, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67668] Another function of VGAM1959 is therefore inhibition of Apolipoprotein L, 3 (APOL3, Accession NM\_014349). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL3. ASAH (Accession NM\_004315) is another VGAM1959 host target gene. ASAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASAH BINDING SITE, designated SEQ ID:10517, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67669] Another function of VGAM1959 is therefore inhibition of ASAH (Accession NM\_004315). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASAH. ATIP1 (Accession NM\_020749) is another VGAM1959 host target gene. ATIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATIP1 BINDING SITE, designated SEQ ID:21863, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67670] Another function of VGAM1959 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577) is another VGAM1959 host target gene. ATP9A BINDING SITE1 and ATP9A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATP9A, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE1 and ATP9A BINDING SITE2, designated SEQ ID:31083 and SEQ ID:31089 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67671] Another function of VGAM1959 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM\_032966) is another VGAM1959 host target gene. BLR1 BINDING SITE1 and BLR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BLR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLR1 BINDING SITE1 and BLR1 BINDING SITE2, designated SEQ ID:26778 and SEQ ID:7448 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also

designated SEQ ID:4670.

[67672] Another function of VGAM1959 is therefore inhibition of Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM\_032966). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLR1. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM\_167769) is another VGAM1959 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44786, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67673] Another function of VGAM1959 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM\_167769). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. Chro-

mosome 15 Open Reading Frame 5 (C15orf5, Accession NM\_030944) is another VGAM1959 host target gene. C15orf5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C15orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C15orf5 BINDING SITE, designated SEQ ID:25216, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67674] Another function of VGAM1959 is therefore inhibition of Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM\_030944). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C15orf5. Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM\_012072) is another VGAM1959 host target gene. C1QR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of C1QR1 BINDING SITE, designated SEQ ID:14339, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67675] Another function of VGAM1959 is therefore inhibition of Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM\_012072). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1. Chromosome 20 Open Reading Frame 100 (C20orf100, Accession NM\_032883) is another VGAM1959 host target gene. C20orf100 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf100 BINDING SITE, designated SEQ ID:26705, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67676] Another function of VGAM1959 is therefore inhibition of Chromosome 20 Open Reading Frame 100 (C20orf100, Accession NM\_032883). Accordingly, utilities of

VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf100. Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821) is another VGAM1959 host target gene. C20orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28084, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67677] Another function of VGAM1959 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM\_080603) is another VGAM1959 host target gene. C20orf162 BINDING SITE1 and C20orf162 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

C20orf162, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf162 BINDING SITE1 and C20orf162 BINDING SITE2, designated SEQ ID:27915 and SEQ ID:27918 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67678] Another function of VGAM1959 is therefore inhibition of Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM\_080603). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf162. Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM\_114191) is another VGAM1959 host target gene. C21orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:42768, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA,

also designated SEQ ID:4670.

[67679] Another function of VGAM1959 is therefore inhibition of Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM\_114191). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108. Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM\_016603) is another VGAM1959 host target gene. C5orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf5 BINDING SITE, designated SEQ ID:18696, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67680] Another function of VGAM1959 is therefore inhibition of Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM\_016603). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf5. Calcium Channel, Voltage-dependent, Gamma Subunit 4 (CACNG4, Acces-

sion NM\_014405) is another VGAM1959 host target gene. CACNG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CACNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNG4 BINDING SITE, designated SEQ ID:15747, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67681] Another function of VGAM1959 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 4 (CACNG4, Accession NM\_014405). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG4. CAT56 (Accession NM\_025263) is another VGAM1959 host target gene. CAT56 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAT56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAT56 BINDING SITE, designated SEQ ID:24932, to the nucleotide sequence of

VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67682] Another function of VGAM1959 is therefore inhibition of CAT56 (Accession NM\_025263). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAT56. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332) is another VGAM1959 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27169, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67683] Another function of VGAM1959 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. Chorionic Gonadotropin, Beta Polypeptide 5

(CGB5, Accession NM\_033043) is another VGAM1959 host target gene. CGB5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB5 BINDING SITE, designated SEQ ID:26931, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67684] Another function of VGAM1959 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide 5 (CGB5, Accession NM\_033043). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB5. Chorionic Gonadotropin, Beta Polypeptide 8 (CGB8, Accession NM\_033183) is another VGAM1959 host target gene. CGB8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGB8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB8 BINDING SITE, designated SEQ ID:27046,

to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67685] Another function of VGAM1959 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide 8 (CGB8, Accession NM\_033183). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB8. Calcium Homeostasis Endoplasmic Reticulum Protein (CHERP, Accession NM\_006387) is another VGAM1959 host target gene. CHERP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHERP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHERP BINDING SITE, designated SEQ ID:13093, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67686] Another function of VGAM1959 is therefore inhibition of Calcium Homeostasis Endoplasmic Reticulum Protein (CHERP, Accession NM\_006387). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHERP.

CSE-C (Accession XM\_166163) is another VGAM1959 host target gene. CSE-C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CSE-C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSE-C BINDING SITE, designated SEQ ID:43981, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67687] Another function of VGAM1959 is therefore inhibition of CSE-C (Accession XM\_166163). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE-C. Calsenilin, Presenilin Binding Protein, EF Hand Transcription Factor (CSEN, Accession NM\_013434) is another VGAM1959 host target gene. CSEN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSEN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSEN BINDING SITE, designated SEQ ID:15090, to the nucleotide sequence of

VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67688] Another function of VGAM1959 is therefore inhibition of Calsenilin, Presenilin Binding Protein, EF Hand Transcription Factor (CSEN, Accession NM\_013434). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSEN. Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM\_020248) is another VGAM1959 host target gene. CTNNBIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTNNBIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNBIP1 BINDING SITE, designated SEQ ID:21543, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67689] Another function of VGAM1959 is therefore inhibition of Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM\_020248). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNBIP1. CXYorf1

(Accession XM\_088704) is another VGAM1959 host target gene. CXYorf1 BINDING SITE1 and CXYorf1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CXYorf1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE1 and CXYorf1 BINDING SITE2, designated SEQ ID:39906 and SEQ ID:39913 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67690] Another function of VGAM1959 is therefore inhibition of CXYorf1 (Accession XM\_088704). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. Death-associated Protein Kinase 3 (DAPK3, Accession NM\_001348) is another VGAM1959 host target gene. DAPK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAPK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPK3 BINDING SITE, designated SEQ

ID:7029, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67691] Another function of VGAM1959 is therefore inhibition of Death-associated Protein Kinase 3 (DAPK3, Accession NM\_001348). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK3. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM1959 host target gene. DDX34 BINDING SITE1 and DDX34 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DDX34, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE1 and DDX34 BINDING SITE2, designated SEQ ID:16160 and SEQ ID:16166 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67692] Another function of VGAM1959 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of

VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. DKFZP434B195 (Accession NM\_031284) is another VGAM1959 host target gene. DKFZP434B195 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434B195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B195 BINDING SITE, designated SEQ ID:25308, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67693] Another function of VGAM1959 is therefore inhibition of DKFZP434B195 (Accession NM\_031284). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B195. DKFZp434C0923 (Accession NM\_017598) is another VGAM1959 host target gene. DKFZp434C0923 BINDING SITE1 and DKFZp434C0923 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZp434C0923, corresponding to HOST TARGET binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE1 and DKFZp434C0923 BINDING SITE2, designated SEQ ID:19064 and SEQ ID:19067 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67694] Another function of VGAM1959 is therefore inhibition of DKFZp434C0923 (Accession NM\_017598). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0923. DKFZP434C212 (Accession XM\_044196) is another VGAM1959 host target gene. DKFZP434C212 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C212 BINDING SITE, designated SEQ ID:34169, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67695] Another function of VGAM1959 is therefore inhibition of

DKFZP434C212 (Accession XM\_044196). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C212. DKFZP434I092 (Accession XM\_042042) is another VGAM1959 host target gene. DKFZP434I092 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434I092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I092 BINDING SITE, designated SEQ ID:33676, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67696] Another function of VGAM1959 is therefore inhibition of DKFZP434I092 (Accession XM\_042042). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I092. DKFZP434I2117 (Accession NM\_031478) is another VGAM1959 host target gene. DKFZP434I2117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434I2117, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I2117 BINDING SITE, designated SEQ ID:25555, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67697] Another function of VGAM1959 is therefore inhibition of DKFZP434I2117 (Accession NM\_031478). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I2117. DKFZP434K1772 (Accession XM\_041936) is another VGAM1959 host target gene. DKFZP434K1772 BINDING SITE1 and DKFZP434K1772 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP434K1772, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K1772 BINDING SITE1 and DKFZP434K1772 BINDING SITE2, designated SEQ ID:33631 and SEQ ID:33634 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67698] Another function of VGAM1959 is therefore inhibition of DKFZP434K1772 (Accession XM\_041936). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K1772. DKFZp434N2435 (Accession XM\_172806) is another VGAM1959 host target gene. DKFZp434N2435 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434N2435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434N2435 BINDING SITE, designated SEQ ID:46090, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67699] Another function of VGAM1959 is therefore inhibition of DKFZp434N2435 (Accession XM\_172806). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434N2435. DKFZp434O0320 (Accession XM\_097012) is another VGAM1959 host target gene. DKFZp434O0320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DKFZp434O0320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434O0320 BINDING SITE, designated SEQ ID:40703, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67700] Another function of VGAM1959 is therefore inhibition of DKFZp434O0320 (Accession XM\_097012). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0320. DKFZP434O047 (Accession NM\_015594) is another VGAM1959 host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17866, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67701] Another function of VGAM1959 is therefore inhibition of

DKFZP434O047 (Accession NM\_015594). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. DKFZP434P1750 (Accession NM\_015527) is another VGAM1959 host target gene. DKFZP434P1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P1750 BINDING SITE, designated SEQ ID:17795, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67702] Another function of VGAM1959 is therefore inhibition of DKFZP434P1750 (Accession NM\_015527). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P1750. DKFZP564F013 (Accession XM\_168479) is another VGAM1959 host target gene. DKFZP564F013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564F013, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F013 BINDING SITE, designated SEQ ID:45201, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67703] Another function of VGAM1959 is therefore inhibition of DKFZP564F013 (Accession XM\_168479). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F013. DKFZP564J157 (Accession NM\_018457) is another VGAM1959 host target gene. DKFZP564J157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564J157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564J157 BINDING SITE, designated SEQ ID:20529, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67704] Another function of VGAM1959 is therefore inhibition of DKFZP564J157 (Accession NM\_018457). Accordingly, util-

ities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564J157. DKFZP564P1916 (Accession NM\_015652) is another VGAM1959 host target gene. DKFZP564P1916 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP564P1916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564P1916 BINDING SITE, designated SEQ ID:17899, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67705] Another function of VGAM1959 is therefore inhibition of DKFZP564P1916 (Accession NM\_015652). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564P1916. DKFZp566H0824 (Accession NM\_017535) is another VGAM1959 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:18978, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67706] Another function of VGAM1959 is therefore inhibition of DKFZp566H0824 (Accession NM\_017535). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. DKFZp586I021 (Accession NM\_032271) is another VGAM1959 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26024, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67707] Another function of VGAM1959 is therefore inhibition of DKFZp586I021 (Accession NM\_032271). Accordingly, utilities of VGAM1959 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp586I021. DKFZP586M1120 (Accession NM\_031294) is another VGAM1959 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25320, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67708] Another function of VGAM1959 is therefore inhibition of DKFZP586M1120 (Accession NM\_031294). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120. DKFZP761D0211 (Accession NM\_032039) is another VGAM1959 host target gene. DKFZP761D0211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761D0211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZP761D0211 BINDING SITE, designated SEQ ID:25738, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67709] Another function of VGAM1959 is therefore inhibition of DKFZP761D0211 (Accession NM\_032039). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761D0211. DKFZp762M136 (Accession XM\_035635) is another VGAM1959 host target gene. DKFZp762M136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762M136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762M136 BINDING SITE, designated SEQ ID:32303, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67710] Another function of VGAM1959 is therefore inhibition of DKFZp762M136 (Accession XM\_035635). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp762M136. DKFZp762P2111 (Accession XM\_098654) is another VGAM1959 host target gene. DKFZp762P2111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762P2111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762P2111 BINDING SITE, designated SEQ ID:41756, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67711] Another function of VGAM1959 is therefore inhibition of DKFZp762P2111 (Accession XM\_098654). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762P2111. Dihydrolipoamide S-acetyltransferase (E2 component of pyruvate dehydrogenase complex) (DLAT, Accession XM\_041355) is another VGAM1959 host target gene. DLAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DLAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DLAT BINDING SITE, designated SEQ ID:33502, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67712] Another function of VGAM1959 is therefore inhibition of Dihydrolipoamide S-acetyltransferase (E2 component of pyruvate dehydrogenase complex) (DLAT, Accession XM\_041355). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLAT. DRIL2 (Accession NM\_006465) is another VGAM1959 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13187, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67713] Another function of VGAM1959 is therefore inhibition of DRIL2 (Accession NM\_006465). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2.

DT1P1A10 (Accession XM\_029187) is another VGAM1959 host target gene. DT1P1A10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DT1P1A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DT1P1A10 BINDING SITE, designated SEQ ID:30860, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67714] Another function of VGAM1959 is therefore inhibition of DT1P1A10 (Accession XM\_029187). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DT1P1A10. DVS27 (Accession NM\_033439) is another VGAM1959 host target gene. DVS27 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVS27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVS27 BINDING SITE, designated SEQ ID:27251, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4670.

[67715] Another function of VGAM1959 is therefore inhibition of DVS27 (Accession NM\_033439). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVS27. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295) is another VGAM1959 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34940, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67716] Another function of VGAM1959 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. F-box Only Protein 27 (FBXO27, Accession XM\_059045) is another VGAM1959 host target gene.

FBXO27 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO27 BINDING SITE, designated SEQ ID:36835, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67717] Another function of VGAM1959 is therefore inhibition of F-box Only Protein 27 (FBXO27, Accession XM\_059045). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO27. FK506 Binding Protein 14, 22 KDa (FKBP14, Accession NM\_017946) is another VGAM1959 host target gene. FKBP14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKBP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP14 BINDING SITE, designated SEQ ID:19644, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA,

also designated SEQ ID:4670.

[67718] Another function of VGAM1959 is therefore inhibition of FK506 Binding Protein 14, 22 KDa (FKBP14, Accession NM\_017946). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP14. FK506 Binding Protein 5 (FKBP5, Accession NM\_004117) is another VGAM1959 host target gene. FKBP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP5 BINDING SITE, designated SEQ ID:10325, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67719] Another function of VGAM1959 is therefore inhibition of FK506 Binding Protein 5 (FKBP5, Accession NM\_004117). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP5. FK506 Binding Protein 9, 63 KDa (FKBP9, Accession XM\_168403) is another VGAM1959 host target gene. FKBP9 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by FKBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP9 BINDING SITE, designated SEQ ID:45145, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67720] Another function of VGAM1959 is therefore inhibition of FK506 Binding Protein 9, 63 KDa (FKBP9, Accession XM\_168403). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP9. FKSG28 (Accession NM\_030929) is another VGAM1959 host target gene. FKSG28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKSG28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKSG28 BINDING SITE, designated SEQ ID:25203, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67721] Another function of VGAM1959 is therefore inhibition of FKSG28 (Accession NM\_030929). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG28. FLJ00026 (Accession XM\_036307) is another VGAM1959 host target gene. FLJ00026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00026 BINDING SITE, designated SEQ ID:32426, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67722] Another function of VGAM1959 is therefore inhibition of FLJ00026 (Accession XM\_036307). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00026. FLJ00060 (Accession XM\_028154) is another VGAM1959 host target gene. FLJ00060 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ00060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00060 BINDING SITE, designated SEQ ID:30629, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67723] Another function of VGAM1959 is therefore inhibition of FLJ00060 (Accession XM\_028154). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00060. FLJ10159 (Accession NM\_018013) is another VGAM1959 host target gene. FLJ10159 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10159 BINDING SITE, designated SEQ ID:19750, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67724] Another function of VGAM1959 is therefore inhibition of FLJ10159 (Accession NM\_018013). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10159. FLJ10656 (Accession NM\_018170) is another VGAM1959 host target gene. FLJ10656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10656 BINDING SITE, designated SEQ ID:19990, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67725] Another function of VGAM1959 is therefore inhibition of FLJ10656 (Accession NM\_018170). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10656. FLJ10724 (Accession NM\_018194) is another VGAM1959 host target gene. FLJ10724 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10724 BINDING SITE, designated SEQ ID:20050, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM

RNA, also designated SEQ ID:4670.

[67726] Another function of VGAM1959 is therefore inhibition of FLJ10724 (Accession NM\_018194). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10724. FLJ10737 (Accession NM\_018198) is another VGAM1959 host target gene. FLJ10737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10737 BINDING SITE, designated SEQ ID:20066, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67727] Another function of VGAM1959 is therefore inhibition of FLJ10737 (Accession NM\_018198). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10737. FLJ10803 (Accession NM\_018224) is another VGAM1959 host target gene. FLJ10803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10803, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10803 BINDING SITE, designated SEQ ID:20151, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67728] Another function of VGAM1959 is therefore inhibition of FLJ10803 (Accession NM\_018224). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10803. FLJ11252 (Accession XM\_041702) is another VGAM1959 host target gene. FLJ11252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11252 BINDING SITE, designated SEQ ID:33567, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67729] Another function of VGAM1959 is therefore inhibition of FLJ11252 (Accession XM\_041702). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ11252. FLJ11710 (Accession NM\_024846) is another VGAM1959 host target gene. FLJ11710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:24274, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67730] Another function of VGAM1959 is therefore inhibition of FLJ11710 (Accession NM\_024846). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11710. FLJ12122 (Accession NM\_024979) is another VGAM1959 host target gene. FLJ12122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12122 BINDING SITE, designated SEQ ID:24539, to the nucleotide

sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67731] Another function of VGAM1959 is therefore inhibition of FLJ12122 (Accession NM\_024979). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12122. FLJ12190 (Accession NM\_025071) is another VGAM1959 host target gene. FLJ12190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12190 BINDING SITE, designated SEQ ID:24668, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67732] Another function of VGAM1959 is therefore inhibition of FLJ12190 (Accession NM\_025071). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12190. FLJ12287 (Accession NM\_022367) is another VGAM1959 host target gene. FLJ12287 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ12287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12287 BINDING SITE, designated SEQ ID:22754, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67733] Another function of VGAM1959 is therefore inhibition of FLJ12287 (Accession NM\_022367). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12287. FLJ12443 (Accession NM\_024830) is another VGAM1959 host target gene. FLJ12443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12443 BINDING SITE, designated SEQ ID:24223, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67734] Another function of VGAM1959 is therefore inhibition of FLJ12443 (Accession NM\_024830). Accordingly, utilities of

VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12443. FLJ12517 (Accession NM\_023007) is another VGAM1959 host target gene. FLJ12517 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12517, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12517 BINDING SITE, designated SEQ ID:23268, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67735] Another function of VGAM1959 is therefore inhibition of FLJ12517 (Accession NM\_023007). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12517. FLJ12547 (Accession NM\_024992) is another VGAM1959 host target gene. FLJ12547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12547

BINDING SITE, designated SEQ ID:24548, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67736] Another function of VGAM1959 is therefore inhibition of FLJ12547 (Accession NM\_024992). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12547. FLJ12650 (Accession NM\_024522) is another VGAM1959 host target gene. FLJ12650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12650 BINDING SITE, designated SEQ ID:23724, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67737] Another function of VGAM1959 is therefore inhibition of FLJ12650 (Accession NM\_024522). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12650. FLJ12687 (Accession NM\_024917) is another VGAM1959 host target gene. FLJ12687 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12687 BINDING SITE, designated SEQ ID:24445, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67738] Another function of VGAM1959 is therefore inhibition of FLJ12687 (Accession NM\_024917). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12687. FLJ12800 (Accession NM\_022903) is another VGAM1959 host target gene. FLJ12800 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:23190, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67739] Another function of VGAM1959 is therefore inhibition of

FLJ12800 (Accession NM\_022903). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800. FLJ12895 (Accession NM\_023926) is another VGAM1959 host target gene. FLJ12895 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12895 BINDING SITE, designated SEQ ID:23404, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67740] Another function of VGAM1959 is therefore inhibition of FLJ12895 (Accession NM\_023926). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12895. FLJ13072 (Accession XM\_117117) is another VGAM1959 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43239, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67741] Another function of VGAM1959 is therefore inhibition of FLJ13072 (Accession XM\_117117). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072. FLJ13158 (Accession NM\_024909) is another VGAM1959 host target gene. FLJ13158 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13158 BINDING SITE, designated SEQ ID:24409, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67742] Another function of VGAM1959 is therefore inhibition of FLJ13158 (Accession NM\_024909). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13158. FLJ13181 (Accession NM\_025188) is another

VGAM1959 host target gene. FLJ13181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13181 BINDING SITE, designated SEQ ID:24828, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67743] Another function of VGAM1959 is therefore inhibition of FLJ13181 (Accession NM\_025188). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13181. FLJ13544 (Accession NM\_025008) is another VGAM1959 host target gene. FLJ13544 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13544 BINDING SITE, designated SEQ ID:24579, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67744] Another function of VGAM1959 is therefore inhibition of FLJ13544 (Accession NM\_025008). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13544. FLJ13910 (Accession NM\_022780) is another VGAM1959 host target gene. FLJ13910 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13910 BINDING SITE, designated SEQ ID:23056, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67745] Another function of VGAM1959 is therefore inhibition of FLJ13910 (Accession NM\_022780). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13910. FLJ14084 (Accession NM\_021637) is another VGAM1959 host target gene. FLJ14084 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14084 BINDING SITE, designated SEQ ID:22284, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67746] Another function of VGAM1959 is therefore inhibition of FLJ14084 (Accession NM\_021637). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14084. FLJ14213 (Accession NM\_024841) is another VGAM1959 host target gene. FLJ14213 BINDING SITE1 and FLJ14213 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ14213, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14213 BINDING SITE1 and FLJ14213 BINDING SITE2, designated SEQ ID:24256 and SEQ ID:24257 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67747] Another function of VGAM1959 is therefore inhibition of FLJ14213 (Accession NM\_024841). Accordingly, utilities of

VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14213. FLJ14641 (Accession NM\_032817) is another VGAM1959 host target gene. FLJ14641 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14641 BINDING SITE, designated SEQ ID:26589, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67748] Another function of VGAM1959 is therefore inhibition of FLJ14641 (Accession NM\_032817). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14641. FLJ14681 (Accession NM\_032824) is another VGAM1959 host target gene. FLJ14681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14681

BINDING SITE, designated SEQ ID:26597, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67749] Another function of VGAM1959 is therefore inhibition of FLJ14681 (Accession NM\_032824). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14681. FLJ14743 (Accession XM\_042708) is another VGAM1959 host target gene. FLJ14743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14743 BINDING SITE, designated SEQ ID:33764, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67750] Another function of VGAM1959 is therefore inhibition of FLJ14743 (Accession XM\_042708). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14743. FLJ14816 (Accession NM\_032845) is another VGAM1959 host target gene. FLJ14816 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14816 BINDING SITE, designated SEQ ID:26639, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67751] Another function of VGAM1959 is therefore inhibition of FLJ14816 (Accession NM\_032845). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14816. FLJ14957 (Accession NM\_032866) is another VGAM1959 host target gene. FLJ14957 BINDING SITE1 and FLJ14957 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ14957, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE1 and FLJ14957 BINDING SITE2, designated SEQ ID:26681 and SEQ ID:26684 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4670.

[67752] Another function of VGAM1959 is therefore inhibition of FLJ14957 (Accession NM\_032866). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957. FLJ20209 (Accession XM\_098142) is another VGAM1959 host target gene. FLJ20209 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20209 BINDING SITE, designated SEQ ID:41405, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67753] Another function of VGAM1959 is therefore inhibition of FLJ20209 (Accession XM\_098142). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20209. FLJ20297 (Accession NM\_017951) is another VGAM1959 host target gene. FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

FLJ20297, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2, designated SEQ ID:19651 and SEQ ID:19360 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67754] Another function of VGAM1959 is therefore inhibition of FLJ20297 (Accession NM\_017951). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297. FLJ20477 (Accession NM\_017837) is another VGAM1959 host target gene. FLJ20477 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20477 BINDING SITE, designated SEQ ID:19502, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67755] Another function of VGAM1959 is therefore inhibition of

FLJ20477 (Accession NM\_017837). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20477. FLJ20509 (Accession NM\_017851) is another VGAM1959 host target gene. FLJ20509 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20509 BINDING SITE, designated SEQ ID:19523, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67756] Another function of VGAM1959 is therefore inhibition of FLJ20509 (Accession NM\_017851). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20509. FLJ21276 (Accession NM\_024633) is another VGAM1959 host target gene. FLJ21276 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ21276 BINDING SITE, designated SEQ ID:23904, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67757] Another function of VGAM1959 is therefore inhibition of FLJ21276 (Accession NM\_024633). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21276. FLJ21313 (Accession NM\_023927) is another VGAM1959 host target gene. FLJ21313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21313 BINDING SITE, designated SEQ ID:23408, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67758] Another function of VGAM1959 is therefore inhibition of FLJ21313 (Accession NM\_023927). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21313. FLJ21551 (Accession NM\_024801) is another

VGAM1959 host target gene. FLJ21551 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21551 BINDING SITE, designated SEQ ID:24180, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67759] Another function of VGAM1959 is therefore inhibition of FLJ21551 (Accession NM\_024801). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21551. FLJ21865 (Accession NM\_022759) is another VGAM1959 host target gene. FLJ21865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21865 BINDING SITE, designated SEQ ID:23000, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67760] Another function of VGAM1959 is therefore inhibition of FLJ21865 (Accession NM\_022759). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21865. FLJ22035 (Accession NM\_024523) is another VGAM1959 host target gene. FLJ22035 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22035 BINDING SITE, designated SEQ ID:23725, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67761] Another function of VGAM1959 is therefore inhibition of FLJ22035 (Accession NM\_024523). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22035. FLJ22233 (Accession NM\_024959) is another VGAM1959 host target gene. FLJ22233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22233 BINDING SITE, designated SEQ ID:24515, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67762] Another function of VGAM1959 is therefore inhibition of FLJ22233 (Accession NM\_024959). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22233. FLJ22341 (Accession NM\_024599) is another VGAM1959 host target gene. FLJ22341 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22341 BINDING SITE, designated SEQ ID:23849, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67763] Another function of VGAM1959 is therefore inhibition of FLJ22341 (Accession NM\_024599). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22341. FLJ22474 (Accession NM\_024719) is another VGAM1959 host target gene. FLJ22474 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22474 BINDING SITE, designated SEQ ID:24050, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67764] Another function of VGAM1959 is therefore inhibition of FLJ22474 (Accession NM\_024719). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22474. FLJ22479 (Accession NM\_024900) is another VGAM1959 host target gene. FLJ22479 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22479 BINDING SITE, designated SEQ ID:24387, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM

RNA, also designated SEQ ID:4670.

[67765] Another function of VGAM1959 is therefore inhibition of FLJ22479 (Accession NM\_024900). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22479. FLJ22679 (Accession NM\_032227) is another VGAM1959 host target gene. FLJ22679 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22679 BINDING SITE, designated SEQ ID:25949, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67766] Another function of VGAM1959 is therefore inhibition of FLJ22679 (Accession NM\_032227). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22679. FLJ22761 (Accession NM\_025130) is another VGAM1959 host target gene. FLJ22761 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22761, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22761 BINDING SITE, designated SEQ ID:24773, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67767] Another function of VGAM1959 is therefore inhibition of FLJ22761 (Accession NM\_025130). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22761. FLJ22940 (Accession NM\_024571) is another VGAM1959 host target gene. FLJ22940 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22940 BINDING SITE, designated SEQ ID:23798, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67768] Another function of VGAM1959 is therefore inhibition of FLJ22940 (Accession NM\_024571). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ22940. FLJ23091 (Accession NM\_024911) is another VGAM1959 host target gene. FLJ23091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23091 BINDING SITE, designated SEQ ID:24418, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67769] Another function of VGAM1959 is therefore inhibition of FLJ23091 (Accession NM\_024911). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23091. FLJ23309 (Accession NM\_024896) is another VGAM1959 host target gene. FLJ23309 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23309 BINDING SITE, designated SEQ ID:24380, to the nucleotide

sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67770] Another function of VGAM1959 is therefore inhibition of FLJ23309 (Accession NM\_024896). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23309. FLJ23499 (Accession NM\_022761) is another VGAM1959 host target gene. FLJ23499 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23499 BINDING SITE, designated SEQ ID:23007, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67771] Another function of VGAM1959 is therefore inhibition of FLJ23499 (Accession NM\_022761). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23499. FLJ23556 (Accession NM\_024880) is another VGAM1959 host target gene. FLJ23556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ23556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23556 BINDING SITE, designated SEQ ID:24320, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67772] Another function of VGAM1959 is therefore inhibition of FLJ23556 (Accession NM\_024880). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23556. FLJ25442 (Accession NM\_145026) is another VGAM1959 host target gene. FLJ25442 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ25442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25442 BINDING SITE, designated SEQ ID:29641, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67773] Another function of VGAM1959 is therefore inhibition of FLJ25442 (Accession NM\_145026). Accordingly, utilities of

VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25442. FLJ31709 (Accession NM\_144636) is another VGAM1959 host target gene. FLJ31709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31709 BINDING SITE, designated SEQ ID:29460, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67774] Another function of VGAM1959 is therefore inhibition of FLJ31709 (Accession NM\_144636). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31709. FLJ31951 (Accession NM\_144726) is another VGAM1959 host target gene. FLJ31951 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31951

BINDING SITE, designated SEQ ID:29551, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67775] Another function of VGAM1959 is therefore inhibition of FLJ31951 (Accession NM\_144726). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31951. FLJ32334 (Accession NM\_144565) is another VGAM1959 host target gene. FLJ32334 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:29369, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67776] Another function of VGAM1959 is therefore inhibition of FLJ32334 (Accession NM\_144565). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334. Forkhead Box O3A (FOXO3A, Accession NM\_001455) is another VGAM1959 host target gene.

FOXO3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXO3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXO3A BINDING SITE, designated SEQ ID:7190, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67777] Another function of VGAM1959 is therefore inhibition of Forkhead Box O3A (FOXO3A, Accession NM\_001455). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXO3A. Frequentin Homolog (Drosophila) (FREQ, Accession NM\_014286) is another VGAM1959 host target gene. FREQ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FREQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREQ BINDING SITE, designated SEQ ID:15564, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ

ID:4670.

[67778] Another function of VGAM1959 is therefore inhibition of Frequentin Homolog (Drosophila) (FREQ, Accession NM\_014286). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREQ. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM\_054016) is another VGAM1959 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUSIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ ID:27625, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67779] Another function of VGAM1959 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM\_054016). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. Glutamine-fructose-6-phosphate Transaminase 1 (GFPT1,

Accession NM\_002056) is another VGAM1959 host target gene. GFPT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFPT1 BINDING SITE, designated SEQ ID:7820, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67780] Another function of VGAM1959 is therefore inhibition of Glutamine-fructose-6-phosphate Transaminase 1 (GFPT1, Accession NM\_002056). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFPT1. Gamma-glutamyltransferase-like Activity 4 (GGTLA4, Accession NM\_080920) is another VGAM1959 host target gene. GGTLA4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GGTLA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGTLA4 BINDING SITE, designated SEQ

ID:28142, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67781] Another function of VGAM1959 is therefore inhibition of Gamma-glutamyltransferase-like Activity 4 (GGTLA4, Accession NM\_080920). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGTLA4. Guanine Nucleotide Binding Protein (G protein), Gamma 11 (GNG11, Accession NM\_004126) is another VGAM1959 host target gene. GNG11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNG11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG11 BINDING SITE, designated SEQ ID:10333, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67782] Another function of VGAM1959 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 11 (GNG11, Accession NM\_004126). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with GNG11. Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM\_133443) is another VGAM1959 host target gene. GPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:28523, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67783] Another function of VGAM1959 is therefore inhibition of Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM\_133443). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. GR6 (Accession NM\_007354) is another VGAM1959 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:14282, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67784] Another function of VGAM1959 is therefore inhibition of GR6 (Accession NM\_007354). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445) is another VGAM1959 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28533, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67785] Another function of VGAM1959 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GRIN3A. GS3955 (Accession NM\_021643) is another VGAM1959 host target gene. GS3955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GS3955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GS3955 BINDING SITE, designated SEQ ID:22306, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67786] Another function of VGAM1959 is therefore inhibition of GS3955 (Accession NM\_021643). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GS3955. General Transcription Factor IIIC, Polypeptide 1, Alpha 220kDa (GTF3C1, Accession NM\_001520) is another VGAM1959 host target gene. GTF3C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTF3C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF3C1

BINDING SITE, designated SEQ ID:7260, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67787] Another function of VGAM1959 is therefore inhibition of General Transcription Factor IIIC, Polypeptide 1, Alpha 220kDa (GTF3C1, Accession NM\_001520). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF3C1. HCCA2 (Accession XM\_039894) is another VGAM1959 host target gene. HCCA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HCCA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCCA2 BINDING SITE, designated SEQ ID:33203, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67788] Another function of VGAM1959 is therefore inhibition of HCCA2 (Accession XM\_039894). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCCA2. HEMK (Accession NM\_016173) is another VGAM1959 host

target gene. HEMK BINDING SITE1 and HEMK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HEMK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE1 and HEMK BINDING SITE2, designated SEQ ID:18267 and SEQ ID:18274 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67789] Another function of VGAM1959 is therefore inhibition of HEMK (Accession NM\_016173). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. HN1L (Accession NM\_144570) is another VGAM1959 host target gene. HN1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HN1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HN1L BINDING SITE, designated SEQ ID:29376, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ

ID:4670.

[67790] Another function of VGAM1959 is therefore inhibition of HN1L (Accession NM\_144570). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HN1L. HPIP (Accession NM\_020524) is another VGAM1959 host target gene. HPIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HPIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPIP BINDING SITE, designated SEQ ID:21740, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67791] Another function of VGAM1959 is therefore inhibition of HPIP (Accession NM\_020524). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPIP. HRIHFB2122 (Accession NM\_007032) is another VGAM1959 host target gene. HRIHFB2122 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRIHFB2122, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRI-HFB2122 BINDING SITE, designated SEQ ID:13898, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67792] Another function of VGAM1959 is therefore inhibition of HRIHFB2122 (Accession NM\_007032). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2122. HS6ST (Accession XM\_030529) is another VGAM1959 host target gene. HS6ST BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS6ST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS6ST BINDING SITE, designated SEQ ID:31073, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67793] Another function of VGAM1959 is therefore inhibition of HS6ST (Accession XM\_030529). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HS6ST. HSP105B (Accession NM\_006644) is another VGAM1959 host target gene. HSP105B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSP105B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSP105B BINDING SITE, designated SEQ ID:13438, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67794] Another function of VGAM1959 is therefore inhibition of HSP105B (Accession NM\_006644). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSP105B. HT002 (Accession NM\_014066) is another VGAM1959 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15284, to the nucleotide sequence of

VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67795] Another function of VGAM1959 is therefore inhibition of HT002 (Accession NM\_014066). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. HU-K4 (Accession NM\_012268) is another VGAM1959 host target gene. HU-K4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HU-K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HU-K4 BINDING SITE, designated SEQ ID:14592, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67796] Another function of VGAM1959 is therefore inhibition of HU-K4 (Accession NM\_012268). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HU-K4. Integrin, Alpha 10 (ITGA10, Accession XM\_002097) is another VGAM1959 host target gene. ITGA10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by ITGA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA10 BINDING SITE, designated SEQ ID:29861, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67797] Another function of VGAM1959 is therefore inhibition of Integrin, Alpha 10 (ITGA10, Accession XM\_002097). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA10. JM11 (Accession NM\_033626) is another VGAM1959 host target gene. JM11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE, designated SEQ ID:27331, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67798] Another function of VGAM1959 is therefore inhibition of JM11 (Accession NM\_033626). Accordingly, utilities of

VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11. Potassium Inwardly-rectifying Channel, Subfamily J, Member 9 (KCNJ9, Accession NM\_004983) is another VGAM1959 host target gene. KCNJ9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNJ9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ9 BINDING SITE, designated SEQ ID:11430, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67799] Another function of VGAM1959 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 9 (KCNJ9, Accession NM\_004983). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ9. Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962) is another VGAM1959 host target gene. KCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNT1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:30978, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67800] Another function of VGAM1959 is therefore inhibition of Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1. KH Domain Containing, RNA Binding, Signal Transduction Associated 1 (KHDRBS1, Accession NM\_006559) is another VGAM1959 host target gene. KHDRBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KHDRBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KHDRBS1 BINDING SITE, designated SEQ ID:13330, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67801] Another function of VGAM1959 is therefore inhibition of

KH Domain Containing, RNA Binding, Signal Transduction Associated 1 (KHDRBS1, Accession NM\_006559). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KHDRBS1. KIAA0052 (Accession XM\_042108) is another VGAM1959 host target gene. KIAA0052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0052 BINDING SITE, designated SEQ ID:33692, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67802] Another function of VGAM1959 is therefore inhibition of KIAA0052 (Accession XM\_042108). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0052. KIAA0057 (Accession NM\_012288) is another VGAM1959 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14618, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67803] Another function of VGAM1959 is therefore inhibition of KIAA0057 (Accession NM\_012288). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. KIAA0087 (Accession NM\_014769) is another VGAM1959 host target gene. KIAA0087 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:16557, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67804] Another function of VGAM1959 is therefore inhibition of KIAA0087 (Accession NM\_014769). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0087. KIAA0140 (Accession NM\_014661) is another VGAM1959 host target gene. KIAA0140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0140 BINDING SITE, designated SEQ ID:16108, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67805] Another function of VGAM1959 is therefore inhibition of KIAA0140 (Accession NM\_014661). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0140. KIAA0146 (Accession XM\_088282) is another VGAM1959 host target gene. KIAA0146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0146 BINDING SITE, designated SEQ ID:39584, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[67806] Another function of VGAM1959 is therefore inhibition of KIAA0146 (Accession XM\_088282). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0146. KIAA0218 (Accession NM\_014760) is another VGAM1959 host target gene. KIAA0218 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0218 BINDING SITE, designated SEQ ID:16519, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67807] Another function of VGAM1959 is therefore inhibition of KIAA0218 (Accession NM\_014760). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0218. KIAA0247 (Accession NM\_014734) is another VGAM1959 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0247, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16374, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67808] Another function of VGAM1959 is therefore inhibition of KIAA0247 (Accession NM\_014734). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0261 (Accession XM\_042946) is another VGAM1959 host target gene. KIAA0261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE, designated SEQ ID:33838, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67809] Another function of VGAM1959 is therefore inhibition of KIAA0261 (Accession XM\_042946). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0261. KIAA0286 (Accession XM\_043118) is another VGAM1959 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:33909, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67810] Another function of VGAM1959 is therefore inhibition of KIAA0286 (Accession XM\_043118). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. KIAA0316 (Accession XM\_045712) is another VGAM1959 host target gene. KIAA0316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0316 BINDING SITE, designated SEQ ID:34531, to the

nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67811] Another function of VGAM1959 is therefore inhibition of KIAA0316 (Accession XM\_045712). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0316. KIAA0323 (Accession XM\_032634) is another VGAM1959 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31691, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67812] Another function of VGAM1959 is therefore inhibition of KIAA0323 (Accession XM\_032634). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA0326 (Accession XM\_034819) is another VGAM1959 host target gene. KIAA0326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0326 BINDING SITE, designated SEQ ID:32160, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67813] Another function of VGAM1959 is therefore inhibition of KIAA0326 (Accession XM\_034819). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0326. KIAA0342 (Accession XM\_047357) is another VGAM1959 host target gene. KIAA0342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0342 BINDING SITE, designated SEQ ID:34961, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67814] Another function of VGAM1959 is therefore inhibition of KIAA0342 (Accession XM\_047357). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0342. KIAA0418 (Accession NM\_014631) is another VGAM1959 host target gene. KIAA0418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0418 BINDING SITE, designated SEQ ID:15999, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67815] Another function of VGAM1959 is therefore inhibition of KIAA0418 (Accession NM\_014631). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0418. KIAA0444 (Accession XM\_030999) is another VGAM1959 host target gene. KIAA0444 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0444 BINDING SITE, designated SEQ ID:31240, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67816] Another function of VGAM1959 is therefore inhibition of KIAA0444 (Accession XM\_030999). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0444. KIAA0450 (Accession NM\_014638) is another VGAM1959 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16033, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67817] Another function of VGAM1959 is therefore inhibition of KIAA0450 (Accession NM\_014638). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0469 (Accession NM\_014851) is another VGAM1959 host target gene. KIAA0469 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16889, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67818] Another function of VGAM1959 is therefore inhibition of KIAA0469 (Accession NM\_014851). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA0495 (Accession XM\_031397) is another VGAM1959 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31357, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67819] Another function of VGAM1959 is therefore inhibition of

KIAA0495 (Accession XM\_031397). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA0514 (Accession NM\_014696) is another VGAM1959 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16205, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67820] Another function of VGAM1959 is therefore inhibition of KIAA0514 (Accession NM\_014696). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA0775 (Accession NM\_014726) is another VGAM1959 host target gene. KIAA0775 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0775 BINDING SITE, designated SEQ ID:16321, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67821] Another function of VGAM1959 is therefore inhibition of KIAA0775 (Accession NM\_014726). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0775. KIAA0794 (Accession XM\_087353) is another VGAM1959 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39186, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67822] Another function of VGAM1959 is therefore inhibition of KIAA0794 (Accession XM\_087353). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. KIAA0802 (Accession XM\_031357) is another

VGAM1959 host target gene. KIAA0802 BINDING SITE1 and KIAA0802 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0802, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0802 BINDING SITE1 and KIAA0802 BINDING SITE2, designated SEQ ID:31350 and SEQ ID:31353 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67823] Another function of VGAM1959 is therefore inhibition of KIAA0802 (Accession XM\_031357). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0802. KIAA0918 (Accession XM\_054869) is another VGAM1959 host target gene. KIAA0918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0918 BINDING SITE, designated SEQ ID:36198, to the

nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67824] Another function of VGAM1959 is therefore inhibition of KIAA0918 (Accession XM\_054869). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0918. KIAA0924 (Accession NM\_014897) is another VGAM1959 host target gene. KIAA0924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:17064, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67825] Another function of VGAM1959 is therefore inhibition of KIAA0924 (Accession NM\_014897). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. KIAA0939 (Accession XM\_030524) is another VGAM1959 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31064, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67826] Another function of VGAM1959 is therefore inhibition of KIAA0939 (Accession XM\_030524). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA0945 (Accession NM\_014952) is another VGAM1959 host target gene. KIAA0945 BINDING SITE1 and KIAA0945 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0945, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0945 BINDING SITE1 and KIAA0945 BINDING SITE2, designated SEQ ID:17292 and SEQ ID:17293 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67827] Another function of VGAM1959 is therefore inhibition of KIAA0945 (Accession NM\_014952). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0945. KIAA0981 (Accession XM\_028867) is another VGAM1959 host target gene. KIAA0981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0981 BINDING SITE, designated SEQ ID:30798, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67828] Another function of VGAM1959 is therefore inhibition of KIAA0981 (Accession XM\_028867). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981. KIAA0982 (Accession NM\_014023) is another VGAM1959 host target gene. KIAA0982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0982, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0982 BINDING SITE, designated SEQ ID:15249, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67829] Another function of VGAM1959 is therefore inhibition of KIAA0982 (Accession NM\_014023). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0982. KIAA1016 (Accession XM\_166260) is another VGAM1959 host target gene. KIAA1016 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1016 BINDING SITE, designated SEQ ID:44086, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67830] Another function of VGAM1959 is therefore inhibition of KIAA1016 (Accession XM\_166260). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1016. KIAA1024 (Accession XM\_044580) is another VGAM1959 host target gene. KIAA1024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1024 BINDING SITE, designated SEQ ID:34238, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67831] Another function of VGAM1959 is therefore inhibition of KIAA1024 (Accession XM\_044580). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1024. KIAA1026 (Accession XM\_048825) is another VGAM1959 host target gene. KIAA1026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1026 BINDING SITE, designated SEQ ID:35280, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[67832] Another function of VGAM1959 is therefore inhibition of KIAA1026 (Accession XM\_048825). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1026. KIAA1032 (Accession XM\_038604) is another VGAM1959 host target gene. KIAA1032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1032 BINDING SITE, designated SEQ ID:32877, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67833] Another function of VGAM1959 is therefore inhibition of KIAA1032 (Accession XM\_038604). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1032. KIAA1052 (Accession NM\_014956) is another VGAM1959 host target gene. KIAA1052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1052, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1052 BINDING SITE, designated SEQ ID:17311, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67834] Another function of VGAM1959 is therefore inhibition of KIAA1052 (Accession NM\_014956). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1052. KIAA1068 (Accession NM\_015332) is another VGAM1959 host target gene. KIAA1068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1068 BINDING SITE, designated SEQ ID:17643, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67835] Another function of VGAM1959 is therefore inhibition of KIAA1068 (Accession NM\_015332). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1068. KIAA1130 (Accession XM\_031104) is another VGAM1959 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31283, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67836] Another function of VGAM1959 is therefore inhibition of KIAA1130 (Accession XM\_031104). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. KIAA1185 (Accession XM\_031399) is another VGAM1959 host target gene. KIAA1185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1185 BINDING SITE, designated SEQ ID:31372, to the

nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67837] Another function of VGAM1959 is therefore inhibition of KIAA1185 (Accession XM\_031399). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1185. KIAA1190 (Accession XM\_048695) is another VGAM1959 host target gene. KIAA1190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1190 BINDING SITE, designated SEQ ID:35224, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67838] Another function of VGAM1959 is therefore inhibition of KIAA1190 (Accession XM\_048695). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1190. KIAA1199 (Accession XM\_051860) is another VGAM1959 host target gene. KIAA1199 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1199 BINDING SITE, designated SEQ ID:35900, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67839] Another function of VGAM1959 is therefore inhibition of KIAA1199 (Accession XM\_051860). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1199. KIAA1233 (Accession XM\_032181) is another VGAM1959 host target gene. KIAA1233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1233 BINDING SITE, designated SEQ ID:31589, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67840] Another function of VGAM1959 is therefore inhibition of KIAA1233 (Accession XM\_032181). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1233. KIAA1247 (Accession XM\_030036) is another VGAM1959 host target gene. KIAA1247 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1247 BINDING SITE, designated SEQ ID:30988, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67841] Another function of VGAM1959 is therefore inhibition of KIAA1247 (Accession XM\_030036). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1247. KIAA1280 (Accession XM\_045766) is another VGAM1959 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1280 BINDING SITE, designated SEQ ID:34553, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67842] Another function of VGAM1959 is therefore inhibition of KIAA1280 (Accession XM\_045766). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. KIAA1322 (Accession XM\_052626) is another VGAM1959 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36023, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67843] Another function of VGAM1959 is therefore inhibition of KIAA1322 (Accession XM\_052626). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1332 (Accession XM\_048774) is another VGAM1959 host target gene. KIAA1332 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:35255, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67844] Another function of VGAM1959 is therefore inhibition of KIAA1332 (Accession XM\_048774). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332. KIAA1399 (Accession XM\_046685) is another VGAM1959 host target gene. KIAA1399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1399 BINDING SITE, designated SEQ ID:34796, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67845] Another function of VGAM1959 is therefore inhibition of

KIAA1399 (Accession XM\_046685). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1399. KIAA1449 (Accession NM\_020839) is another VGAM1959 host target gene. KIAA1449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1449 BINDING SITE, designated SEQ ID:21899, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67846] Another function of VGAM1959 is therefore inhibition of KIAA1449 (Accession NM\_020839). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1449. KIAA1458 (Accession XM\_044434) is another VGAM1959 host target gene. KIAA1458 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1458 BINDING SITE, designated SEQ ID:34204, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67847] Another function of VGAM1959 is therefore inhibition of KIAA1458 (Accession XM\_044434). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1458. KIAA1465 (Accession XM\_027396) is another VGAM1959 host target gene. KIAA1465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:30502, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67848] Another function of VGAM1959 is therefore inhibition of KIAA1465 (Accession XM\_027396). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465. KIAA1467 (Accession XM\_049605) is another

VGAM1959 host target gene. KIAA1467 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1467, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1467 BINDING SITE, designated SEQ ID:35451, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67849] Another function of VGAM1959 is therefore inhibition of KIAA1467 (Accession XM\_049605). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1467. KIAA1509 (Accession XM\_029353) is another VGAM1959 host target gene. KIAA1509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:30877, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67850] Another function of VGAM1959 is therefore inhibition of KIAA1509 (Accession XM\_029353). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509. KIAA1576 (Accession XM\_038186) is another VGAM1959 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:32772, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67851] Another function of VGAM1959 is therefore inhibition of KIAA1576 (Accession XM\_038186). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. KIAA1580 (Accession XM\_045271) is another VGAM1959 host target gene. KIAA1580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1580, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1580 BINDING SITE, designated SEQ ID:34412, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67852] Another function of VGAM1959 is therefore inhibition of KIAA1580 (Accession XM\_045271). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1580. KIAA1656 (Accession XM\_038022) is another VGAM1959 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32732, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67853] Another function of VGAM1959 is therefore inhibition of KIAA1656 (Accession XM\_038022). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1656. KIAA1679 (Accession XM\_046570) is another VGAM1959 host target gene. KIAA1679 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1679 BINDING SITE, designated SEQ ID:34754, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67854] Another function of VGAM1959 is therefore inhibition of KIAA1679 (Accession XM\_046570). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1679. KIAA1729 (Accession XM\_114418) is another VGAM1959 host target gene. KIAA1729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:42950, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[67855] Another function of VGAM1959 is therefore inhibition of KIAA1729 (Accession XM\_114418). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729. KIAA1755 (Accession XM\_028810) is another VGAM1959 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:30752, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67856] Another function of VGAM1959 is therefore inhibition of KIAA1755 (Accession XM\_028810). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. KIAA1789 (Accession XM\_040486) is another VGAM1959 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1789, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:33313, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67857] Another function of VGAM1959 is therefore inhibition of KIAA1789 (Accession XM\_040486). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. KIAA1798 (Accession XM\_027074) is another VGAM1959 host target gene. KIAA1798 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1798 BINDING SITE, designated SEQ ID:30401, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67858] Another function of VGAM1959 is therefore inhibition of KIAA1798 (Accession XM\_027074). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1798. KIAA1805 (Accession XM\_086976) is another VGAM1959 host target gene. KIAA1805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1805 BINDING SITE, designated SEQ ID:39002, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67859] Another function of VGAM1959 is therefore inhibition of KIAA1805 (Accession XM\_086976). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1805. KIAA1870 (Accession NM\_032888) is another VGAM1959 host target gene. KIAA1870 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1870 BINDING SITE, designated SEQ ID:26709, to the

nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67860] Another function of VGAM1959 is therefore inhibition of KIAA1870 (Accession NM\_032888). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1870. KIAA1904 (Accession XM\_056282) is another VGAM1959 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36374, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67861] Another function of VGAM1959 is therefore inhibition of KIAA1904 (Accession XM\_056282). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. KIAA1906 (Accession XM\_055095) is another VGAM1959 host target gene. KIAA1906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1906 BINDING SITE, designated SEQ ID:36229, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67862] Another function of VGAM1959 is therefore inhibition of KIAA1906 (Accession XM\_055095). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1906. KIAA1908 (Accession XM\_055834) is another VGAM1959 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36340, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67863] Another function of VGAM1959 is therefore inhibition of KIAA1908 (Accession XM\_055834). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. KIAA1924 (Accession XM\_057091) is another VGAM1959 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36476, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67864] Another function of VGAM1959 is therefore inhibition of KIAA1924 (Accession XM\_057091). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. KIAA1941 (Accession XM\_059318) is another VGAM1959 host target gene. KIAA1941 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1941 BINDING SITE, designated SEQ ID:36954, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67865] Another function of VGAM1959 is therefore inhibition of KIAA1941 (Accession XM\_059318). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1941. KIAA1948 (Accession XM\_091984) is another VGAM1959 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40079, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67866] Another function of VGAM1959 is therefore inhibition of KIAA1948 (Accession XM\_091984). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948. KIAA1950 (Accession XM\_166532) is another VGAM1959 host target gene. KIAA1950 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44486, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67867] Another function of VGAM1959 is therefore inhibition of KIAA1950 (Accession XM\_166532). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. KIAA1977 (Accession XM\_058800) is another VGAM1959 host target gene. KIAA1977 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1977 BINDING SITE, designated SEQ ID:36745, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67868] Another function of VGAM1959 is therefore inhibition of

KIAA1977 (Accession XM\_058800). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1977. KIAA1981 (Accession XM\_114000) is another VGAM1959 host target gene. KIAA1981 BINDING SITE1 and KIAA1981 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1981, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1981 BINDING SITE1 and KIAA1981 BINDING SITE2, designated SEQ ID:42608 and SEQ ID:42611 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67869] Another function of VGAM1959 is therefore inhibition of KIAA1981 (Accession XM\_114000). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1981. Kinesin Family Member 13B (KIF13B, Accession NM\_015254) is another VGAM1959 host target gene. KIF13B BINDING SITE1 and KIF13B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions

of mRNA encoded by KIF13B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF13B BINDING SITE1 and KIF13B BINDING SITE2, designated SEQ ID:17583 and SEQ ID:42788 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67870] Another function of VGAM1959 is therefore inhibition of Kinesin Family Member 13B (KIF13B, Accession NM\_015254). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF13B. LIM and SH3 Protein 1 (LASP1, Accession NM\_006148) is another VGAM1959 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12795, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67871] Another function of VGAM1959 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM\_006148). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. LATS, Large Tumor Suppressor, Homolog 1 (Drosophila) (LATS1, Accession XM\_015547) is another VGAM1959 host target gene. LATS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LATS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LATS1 BINDING SITE, designated SEQ ID:30239, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67872] Another function of VGAM1959 is therefore inhibition of LATS, Large Tumor Suppressor, Homolog 1 (Drosophila) (LATS1, Accession XM\_015547). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LATS1. LIM Domain Kinase 2 (LIMK2, Accession NM\_016733) is another VGAM1959 host target gene. LIMK2 BINDING

SITE1 and LIMK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIMK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK2 BINDING SITE1 and LIMK2 BINDING SITE2, designated SEQ ID:18784 and SEQ ID:12094 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67873] Another function of VGAM1959 is therefore inhibition of LIM Domain Kinase 2 (LIMK2, Accession NM\_016733). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK2. Mitogen-activated Protein Kinase 8 Interacting Protein 2 (MAPK8IP2, Accession NM\_016431) is another VGAM1959 host target gene. MAPK8IP2 BINDING SITE1 through MAPK8IP2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK8IP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK8IP2 BINDING SITE1

through MAPK8IP2 BINDING SITE3, designated SEQ ID:18552, SEQ ID:14704 and SEQ ID:29155 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67874] Another function of VGAM1959 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 2 (MAPK8IP2, Accession NM\_016431). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK8IP2. MGC10471 (Accession NM\_030818) is another VGAM1959 host target gene. MGC10471 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC10471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10471 BINDING SITE, designated SEQ ID:25147, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67875] Another function of VGAM1959 is therefore inhibition of MGC10471 (Accession NM\_030818). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC10471. MGC10715 (Accession NM\_024325) is another VGAM1959 host target gene. MGC10715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:23614, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67876] Another function of VGAM1959 is therefore inhibition of MGC10715 (Accession NM\_024325). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715. MGC12760 (Accession NM\_032723) is another VGAM1959 host target gene. MGC12760 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12760 BINDING SITE, designated SEQ ID:26448, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[67877] Another function of VGAM1959 is therefore inhibition of MGC12760 (Accession NM\_032723). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12760. MGC13114 (Accession NM\_032366) is another VGAM1959 host target gene. MGC13114 BINDING SITE1 and MGC13114 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC13114, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13114 BINDING SITE1 and MGC13114 BINDING SITE2, designated SEQ ID:26151 and SEQ ID:26152 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67878] Another function of VGAM1959 is therefore inhibition of MGC13114 (Accession NM\_032366). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13114. MGC15873 (Accession NM\_032920) is another VGAM1959 host target gene. MGC15873 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15873 BINDING SITE, designated SEQ ID:26741, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67879] Another function of VGAM1959 is therefore inhibition of MGC15873 (Accession NM\_032920). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15873. MGC2306 (Accession NM\_032638) is another VGAM1959 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26352, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67880] Another function of VGAM1959 is therefore inhibition of

MGC2306 (Accession NM\_032638). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. MGC2721 (Accession NM\_032737) is another VGAM1959 host target gene. MGC2721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2721 BINDING SITE, designated SEQ ID:26462, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67881] Another function of VGAM1959 is therefore inhibition of MGC2721 (Accession NM\_032737). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2721. MGC3222 (Accession NM\_024334) is another VGAM1959 host target gene. MGC3222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC3222 BINDING SITE, designated SEQ ID:23643, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67882] Another function of VGAM1959 is therefore inhibition of MGC3222 (Accession NM\_024334). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3222. MGC4415 (Accession NM\_031484) is another VGAM1959 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25574, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67883] Another function of VGAM1959 is therefore inhibition of MGC4415 (Accession NM\_031484). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. MGC4796 (Accession XM\_029031) is another

VGAM1959 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30832, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67884] Another function of VGAM1959 is therefore inhibition of MGC4796 (Accession XM\_029031). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796. MGC8407 (Accession NM\_024046) is another VGAM1959 host target gene. MGC8407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC8407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC8407 BINDING SITE, designated SEQ ID:23480, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67885] Another function of VGAM1959 is therefore inhibition of MGC8407 (Accession NM\_024046). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC8407. MIDORI (Accession XM\_057651) is another VGAM1959 host target gene. MIDORI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIDORI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIDORI BINDING SITE, designated SEQ ID:36531, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67886] Another function of VGAM1959 is therefore inhibition of MIDORI (Accession XM\_057651). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIDORI. MRF2 (Accession XM\_084482) is another VGAM1959 host target gene. MRF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRF2 BINDING SITE, designated SEQ ID:37601, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67887] Another function of VGAM1959 is therefore inhibition of MRF2 (Accession XM\_084482). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRF2. MY038 (Accession NM\_032626) is another VGAM1959 host target gene. MY038 BINDING SITE1 and MY038 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MY038, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MY038 BINDING SITE1 and MY038 BINDING SITE2, designated SEQ ID:26345 and SEQ ID:26346 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67888] Another function of VGAM1959 is therefore inhibition of MY038 (Accession NM\_032626). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MY038. NDRG Family Member 4 (NDRG4, Accession NM\_022910) is another VGAM1959 host target gene. NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2, designated SEQ ID:23212 and SEQ ID:21697 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67889] Another function of VGAM1959 is therefore inhibition of NDRG Family Member 4 (NDRG4, Accession NM\_022910). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG4. NUDEL (Accession NM\_030808) is another VGAM1959 host target gene. NUDEL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDEL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NUDEL BINDING SITE, designated SEQ ID:25123, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67890] Another function of VGAM1959 is therefore inhibition of NUDEL (Accession NM\_030808). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDEL. Nucleoredoxin (NXN, Accession NM\_022463) is another VGAM1959 host target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22813, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67891] Another function of VGAM1959 is therefore inhibition of Nucleoredoxin (NXN, Accession NM\_022463). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with NXN. Ornithine Decarboxylase Antizyme 2 (OAZ2, Accession NM\_002537) is another VGAM1959 host target gene. OAZ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZ2 BINDING SITE, designated SEQ ID:8377, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67892] Another function of VGAM1959 is therefore inhibition of Ornithine Decarboxylase Antizyme 2 (OAZ2, Accession NM\_002537). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZ2. Obscurin, Cytoskeletal Calmodulin and Titin-interacting RhoGEF (OBSCN, Accession XM\_047536) is another VGAM1959 host target gene. OBSCN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OBSCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBSCN BINDING SITE, designated SEQ

ID:34989, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67893] Another function of VGAM1959 is therefore inhibition of Obscurin, Cytoskeletal Calmodulin and Titin-interacting RhoGEF (OBSCN, Accession XM\_047536). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBSCN. Olfactomedin 3 (OLFM3, Accession XM\_088951) is another VGAM1959 host target gene. OLFM3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OLFM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM3 BINDING SITE, designated SEQ ID:39962, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67894] Another function of VGAM1959 is therefore inhibition of Olfactomedin 3 (OLFM3, Accession XM\_088951). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with OLFM3. p25 (Accession NM\_007030) is another VGAM1959 host target gene. p25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by p25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of p25 BINDING SITE, designated SEQ ID:13891, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67895] Another function of VGAM1959 is therefore inhibition of p25 (Accession NM\_007030). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with p25. Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM\_005446) is another VGAM1959 host target gene. P2RXL1 BINDING SITE1 and P2RXL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by P2RXL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE1 and P2RXL1 BINDING SITE2, designated SEQ

ID:11930 and SEQ ID:11934 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67896] Another function of VGAM1959 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM\_005446). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RXL1. PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM\_015889) is another VGAM1959 host target gene. PC-QAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCQAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCQAP BINDING SITE, designated SEQ ID:18035, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67897] Another function of VGAM1959 is therefore inhibition of PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession

NM\_015889). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCQAP. Phosphodiesterase 11A (PDE11A, Accession NM\_016953) is another VGAM1959 host target gene. PDE11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE11A BINDING SITE, designated SEQ ID:18867, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67898] Another function of VGAM1959 is therefore inhibition of Phosphodiesterase 11A (PDE11A, Accession NM\_016953). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE11A. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM\_014644) is another VGAM1959 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4DIP, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:16051, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67899] Another function of VGAM1959 is therefore inhibition of Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM\_014644). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. PIF1 (Accession XM\_027898) is another VGAM1959 host target gene. PIF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIF1 BINDING SITE, designated SEQ ID:30587, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67900] Another function of VGAM1959 is therefore inhibition of PIF1 (Accession XM\_027898). Accordingly, utilities of

VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIF1. PTEN Induced Putative Kinase 1 (PINK1, Accession NM\_032409) is another VGAM1959 host target gene. PINK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PINK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PINK1 BINDING SITE, designated SEQ ID:26194, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67901] Another function of VGAM1959 is therefore inhibition of PTEN Induced Putative Kinase 1 (PINK1, Accession NM\_032409). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PINK1. Phosphatidylserine Decarboxylase (PISD, Accession NM\_014338) is another VGAM1959 host target gene. PISD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PISD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PISD BINDING SITE, designated SEQ ID:15655, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67902] Another function of VGAM1959 is therefore inhibition of Phosphatidylserine Decarboxylase (PISD, Accession NM\_014338). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PISD. Phospholipase C-like 2 (PLCL2, Accession XM\_042836) is another VGAM1959 host target gene. PLCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLCL2 BINDING SITE, designated SEQ ID:33796, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67903] Another function of VGAM1959 is therefore inhibition of Phospholipase C-like 2 (PLCL2, Accession XM\_042836). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with PLCL2. PM5 (Accession XM\_027359) is another VGAM1959 host target gene. PM5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PM5 BINDING SITE, designated SEQ ID:30498, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67904] Another function of VGAM1959 is therefore inhibition of PM5 (Accession XM\_027359). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PM5. PP3501 (Accession NM\_021731) is another VGAM1959 host target gene. PP3501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PP3501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP3501 BINDING SITE, designated SEQ ID:22333, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4670.

[67905] Another function of VGAM1959 is therefore inhibition of PP3501 (Accession NM\_021731). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP3501. PTPRF Interacting Protein, Binding Protein 1 (liprin beta 1) (PPFIBP1, Accession NM\_003622) is another VGAM1959 host target gene. PPFIBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPFIBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPFIBP1 BINDING SITE, designated SEQ ID:9686, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67906] Another function of VGAM1959 is therefore inhibition of PTPRF Interacting Protein, Binding Protein 1 (liprin beta 1) (PPFIBP1, Accession NM\_003622). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIBP1. Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM\_086650) is another VGAM1959

host target gene. PPP4R1L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPP4R1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP4R1L BINDING SITE, designated SEQ ID:38817, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67907] Another function of VGAM1959 is therefore inhibition of Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM\_086650). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP4R1L. Protein Regulator of Cytokinesis 1 (PRC1, Accession NM\_003981) is another VGAM1959 host target gene. PRC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRC1 BINDING SITE, designated SEQ ID:10120, to the nucleotide sequence of VGAM1959 RNA, herein

designated VGAM RNA, also designated SEQ ID:4670.

[67908] Another function of VGAM1959 is therefore inhibition of Protein Regulator of Cytokinesis 1 (PRC1, Accession NM\_003981). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRC1. PRO2405 (Accession NM\_018627) is another VGAM1959 host target gene. PRO2405 BINDING SITE1 and PRO2405 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRO2405, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2405 BINDING SITE1 and PRO2405 BINDING SITE2, designated SEQ ID:20698 and SEQ ID:20699 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67909] Another function of VGAM1959 is therefore inhibition of PRO2405 (Accession NM\_018627). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2405. PRRDH (Accession NM\_015725) is another VGAM1959 host target gene. PRRDH BINDING SITE1 and

PRRDH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRRDH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRRDH BINDING SITE1 and PRRDH BINDING SITE2, designated SEQ ID:17935 and SEQ ID:17936 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67910] Another function of VGAM1959 is therefore inhibition of PRRDH (Accession NM\_015725). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRDH. Protein Tyrosine Phosphatase, Receptor Type, R (PTPRR, Accession NM\_002849) is another VGAM1959 host target gene. PTPRR BINDING SITE1 and PTPRR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRR BINDING SITE1 and PTPRR BINDING SITE2, designated SEQ ID:8743 and

SEQ ID:8697 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67911] Another function of VGAM1959 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, R (PTPRR, Accession NM\_002849). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRR. RAB3D, Member RAS Oncogene Family (RAB3D, Accession NM\_004283) is another VGAM1959 host target gene. RAB3D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3D BINDING SITE, designated SEQ ID:10495, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67912] Another function of VGAM1959 is therefore inhibition of RAB3D, Member RAS Oncogene Family (RAB3D, Accession NM\_004283). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RAB3D. RAI (Accession NM\_006663) is another VGAM1959 host target gene. RAI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI BINDING SITE, designated SEQ ID:13469, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67913] Another function of VGAM1959 is therefore inhibition of RAI (Accession NM\_006663). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI. Retinoic Acid Induced 17 (RAI17, Accession XM\_166091) is another VGAM1959 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43864, to the nucleotide sequence of VGAM1959 RNA, herein designated

VGAM RNA, also designated SEQ ID:4670.

[67914] Another function of VGAM1959 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM\_166091). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. RAS Guanyl Releasing Protein 4 (RASGRP4, Accession NM\_052949) is another VGAM1959 host target gene. RASGRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASGRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRP4 BINDING SITE, designated SEQ ID:27506, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67915] Another function of VGAM1959 is therefore inhibition of RAS Guanyl Releasing Protein 4 (RASGRP4, Accession NM\_052949). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP4. Regulator of G-protein Signalling 12 (RGS12, Accession NM\_002926) is another VGAM1959 host target gene. RGS12 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RGS12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS12 BINDING SITE, designated SEQ ID:8830, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67916] Another function of VGAM1959 is therefore inhibition of Regulator of G-protein Signalling 12 (RGS12, Accession NM\_002926). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS12. RLUC (Accession NM\_058192) is another VGAM1959 host target gene. RLUC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RLUC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RLUC BINDING SITE, designated SEQ ID:27754, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67917] Another function of VGAM1959 is therefore inhibition of RLUC (Accession NM\_058192). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RLUC. RPP14 (Accession XM\_003044) is another VGAM1959 host target gene. RPP14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPP14 BINDING SITE, designated SEQ ID:29926, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67918] Another function of VGAM1959 is therefore inhibition of RPP14 (Accession XM\_003044). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP14. SAM Domain and HD Domain 1 (SAMHD1, Accession XM\_028704) is another VGAM1959 host target gene. SAMHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SAMHD1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAMHD1 BINDING SITE, designated SEQ ID:30737, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67919] Another function of VGAM1959 is therefore inhibition of SAM Domain and HD Domain 1 (SAMHD1, Accession XM\_028704). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAMHD1. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM\_004263) is another VGAM1959 host target gene. SEMA4F BINDING SITE1 and SEMA4F BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEMA4F, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4F BINDING SITE1 and SEMA4F BINDING SITE2, designated SEQ ID:10456 and SEQ ID:10458 respectively, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[67920] Another function of VGAM1959 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM\_004263). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4F. Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564) is another VGAM1959 host target gene. SLC39A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC39A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A3 BINDING SITE, designated SEQ ID:29357, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67921] Another function of VGAM1959 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

SLC39A3. SMC1 Structural Maintenance of Chromosomes 1-like 1 (yeast) (SMC1L1, Accession XM\_050403) is another VGAM1959 host target gene. SMC1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMC1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMC1L1 BINDING SITE, designated SEQ ID:35618, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67922] Another function of VGAM1959 is therefore inhibition of SMC1 Structural Maintenance of Chromosomes 1-like 1 (yeast) (SMC1L1, Accession XM\_050403). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMC1L1. Syntrophin, Gamma 1 (SNTG1, Accession NM\_018967) is another VGAM1959 host target gene. SNTG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SNTG1 BINDING SITE, designated SEQ ID:21041, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67923] Another function of VGAM1959 is therefore inhibition of Syntrophin, Gamma 1 (SNTG1, Accession NM\_018967). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTG1. SR-BP1 (Accession NM\_005866) is another VGAM1959 host target gene. SR-BP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SR-BP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SR-BP1 BINDING SITE, designated SEQ ID:12485, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67924] Another function of VGAM1959 is therefore inhibition of SR-BP1 (Accession NM\_005866). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SR-BP1.

SSB-3 (Accession NM\_080861) is another VGAM1959 host target gene. SSB-3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSB-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSB-3 BINDING SITE, designated SEQ ID:28102, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67925] Another function of VGAM1959 is therefore inhibition of SSB-3 (Accession NM\_080861). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-3. SSH2 (Accession XM\_030846) is another VGAM1959 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31190, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ

ID:4670.

[67926] Another function of VGAM1959 is therefore inhibition of SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. Syntaxin 3A (STX3A, Accession NM\_004177) is another VGAM1959 host target gene. STX3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX3A BINDING SITE, designated SEQ ID:10387, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67927] Another function of VGAM1959 is therefore inhibition of Syntaxin 3A (STX3A, Accession NM\_004177). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX3A. Sulfotransferase Family, Cytosolic, 1C, Member 2 (SULT1C2, Accession NM\_006588) is another VGAM1959 host target gene. SULT1C2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by SULT1C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C2 BINDING SITE, designated SEQ ID:13353, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67928] Another function of VGAM1959 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 2 (SULT1C2, Accession NM\_006588). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C2. T-box 4 (TBX4, Accession NM\_018488) is another VGAM1959 host target gene. TBX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX4 BINDING SITE, designated SEQ ID:20546, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67929] Another function of VGAM1959 is therefore inhibition of

T-box 4 (TBX4, Accession NM\_018488). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBX4. Testis Expressed Sequence 27 (TEX27, Accession NM\_021943) is another VGAM1959 host target gene. TEX27 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEX27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEX27 BINDING SITE, designated SEQ ID:22459, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67930] Another function of VGAM1959 is therefore inhibition of Testis Expressed Sequence 27 (TEX27, Accession NM\_021943). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEX27. Tigger Transposable Element Derived 1 (TIGD1, Accession XM\_114293) is another VGAM1959 host target gene. TIGD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIGD1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIGD1 BINDING SITE, designated SEQ ID:42848, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67931] Another function of VGAM1959 is therefore inhibition of Tigger Transposable Element Derived 1 (TIGD1, Accession XM\_114293). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIGD1. Tumor Necrosis Factor, Alpha-induced Protein 3 (TNFAIP3, Accession NM\_006290) is another VGAM1959 host target gene. TNFAIP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFAIP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP3 BINDING SITE, designated SEQ ID:12979, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67932] Another function of VGAM1959 is therefore inhibition of

Tumor Necrosis Factor, Alpha-induced Protein 3 (TNFAIP3, Accession NM\_006290). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP3. Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_016381) is another VGAM1959 host target gene. TREX1 BINDING SITE1 through TREX1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TREX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE1 through TREX1 BINDING SITE3, designated SEQ ID:18521, SEQ ID:27341 and SEQ ID:27348 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67933] Another function of VGAM1959 is therefore inhibition of Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_016381). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. UBCE7IP5 (Accession NM\_014948) is another VGAM1959 host target gene. UBCE7IP5 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by UBCE7IP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBCE7IP5 BINDING SITE, designated SEQ ID:17271, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67934] Another function of VGAM1959 is therefore inhibition of UBCE7IP5 (Accession NM\_014948). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBCE7IP5. UDP-glucuronate Decarboxylase 1 (UXS1, Accession NM\_025076) is another VGAM1959 host target gene. UXS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by UXS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UXS1 BINDING SITE, designated SEQ ID:24677, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67935] Another function of VGAM1959 is therefore inhibition of

UDP-glucuronate Decarboxylase 1 (UXS1, Accession NM\_025076). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UXS1. VI (Accession NM\_013443) is another VGAM1959 host target gene. VI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VI BINDING SITE, designated SEQ ID:15110, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67936] Another function of VGAM1959 is therefore inhibition of VI (Accession NM\_013443). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VI. VLCS-H1 (Accession NM\_014031) is another VGAM1959 host target gene. VLCS-H1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VLCS-H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of VLCS-H1 BINDING SITE, designated SEQ ID:15260, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67937] Another function of VGAM1959 is therefore inhibition of VLCS-H1 (Accession NM\_014031). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VLCS-H1. WD Repeat Domain 7 (WDR7, Accession NM\_015285) is another VGAM1959 host target gene. WDR7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR7 BINDING SITE, designated SEQ ID:17610, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67938] Another function of VGAM1959 is therefore inhibition of WD Repeat Domain 7 (WDR7, Accession NM\_015285). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR7. Zinc Finger, DHHC Domain Con-

taining 8 (ZDHHC8, Accession XM\_033828) is another VGAM1959 host target gene. ZDHHC8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZDHHC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC8 BINDING SITE, designated SEQ ID:31962, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67939] Another function of VGAM1959 is therefore inhibition of Zinc Finger, DHHC Domain Containing 8 (ZDHHC8, Accession XM\_033828). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC8. Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM\_014569) is another VGAM1959 host target gene. ZFP95 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZFP95, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP95 BINDING SITE, designated SEQ

ID:15923, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67940] Another function of VGAM1959 is therefore inhibition of Zinc Finger Protein 95 Homolog (mouse) (ZFP95, Accession NM\_014569). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP95. ZID (Accession NM\_006626) is another VGAM1959 host target gene. ZID BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZID BINDING SITE, designated SEQ ID:13416, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67941] Another function of VGAM1959 is therefore inhibition of ZID (Accession NM\_006626). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZID. Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM\_091895) is another VGAM1959 host target gene.

ZNF17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF17 BINDING SITE, designated SEQ ID:40070, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67942] Another function of VGAM1959 is therefore inhibition of Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM\_091895). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF17. Zinc Finger Protein 317 (ZNF317, Accession XM\_050435) is another VGAM1959 host target gene. ZNF317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF317 BINDING SITE, designated SEQ ID:35635, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM

RNA, also designated SEQ ID:4670.

[67943] Another function of VGAM1959 is therefore inhibition of Zinc Finger Protein 317 (ZNF317, Accession XM\_050435). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF317. LOC115051 (Accession XM\_010647) is another VGAM1959 host target gene. LOC115051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115051 BINDING SITE, designated SEQ ID:30161, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67944] Another function of VGAM1959 is therefore inhibition of LOC115051 (Accession XM\_010647). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115051. LOC115110 (Accession XM\_049825) is another VGAM1959 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35509, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67945] Another function of VGAM1959 is therefore inhibition of LOC115110 (Accession XM\_049825). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC115343 (Accession XM\_050640) is another VGAM1959 host target gene. LOC115343 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115343 BINDING SITE, designated SEQ ID:35666, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67946] Another function of VGAM1959 is therefore inhibition of LOC115343 (Accession XM\_050640). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115343. LOC115708 (Accession XM\_056552) is another VGAM1959 host target gene. LOC115708 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115708 BINDING SITE, designated SEQ ID:36405, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67947] Another function of VGAM1959 is therefore inhibition of LOC115708 (Accession XM\_056552). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115708. LOC120772 (Accession XM\_058505) is another VGAM1959 host target gene. LOC120772 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC120772 BINDING SITE, designated SEQ ID:36628, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67948] Another function of VGAM1959 is therefore inhibition of LOC120772 (Accession XM\_058505). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120772. LOC122792 (Accession NM\_145251) is another VGAM1959 host target gene. LOC122792 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122792 BINDING SITE, designated SEQ ID:29763, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67949] Another function of VGAM1959 is therefore inhibition of LOC122792 (Accession NM\_145251). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122792. LOC124145 (Accession XM\_058775) is another VGAM1959 host target gene. LOC124145 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124145 BINDING SITE, designated SEQ ID:36735, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67950] Another function of VGAM1959 is therefore inhibition of LOC124145 (Accession XM\_058775). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124145. LOC124245 (Accession NM\_144604) is another VGAM1959 host target gene. LOC124245 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124245 BINDING SITE, designated SEQ ID:29418, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67951] Another function of VGAM1959 is therefore inhibition of

LOC124245 (Accession NM\_144604). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124245. LOC124538 (Accession XM\_064177) is another VGAM1959 host target gene. LOC124538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124538 BINDING SITE, designated SEQ ID:37257, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67952] Another function of VGAM1959 is therefore inhibition of LOC124538 (Accession XM\_064177). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124538. LOC124842 (Accession XM\_064333) is another VGAM1959 host target gene. LOC124842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC124842 BINDING SITE, designated SEQ ID:37259, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67953] Another function of VGAM1959 is therefore inhibition of LOC124842 (Accession XM\_064333). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124842. LOC126917 (Accession XM\_059091) is another VGAM1959 host target gene. LOC126917 BINDING SITE1 and LOC126917 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC126917, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE1 and LOC126917 BINDING SITE2, designated SEQ ID:36874 and SEQ ID:36875 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67954] Another function of VGAM1959 is therefore inhibition of LOC126917 (Accession XM\_059091). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC126917. LOC132671 (Accession NM\_145263) is another VGAM1959 host target gene. LOC132671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132671 BINDING SITE, designated SEQ ID:29776, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67955] Another function of VGAM1959 is therefore inhibition of LOC132671 (Accession NM\_145263). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132671. LOC133308 (Accession XM\_059638) is another VGAM1959 host target gene. LOC133308 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC133308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133308 BINDING SITE, designated SEQ ID:37036, to

the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67956] Another function of VGAM1959 is therefore inhibition of LOC133308 (Accession XM\_059638). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133308. LOC133923 (Accession XM\_068602) is another VGAM1959 host target gene. LOC133923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC133923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133923 BINDING SITE, designated SEQ ID:37382, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67957] Another function of VGAM1959 is therefore inhibition of LOC133923 (Accession XM\_068602). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133923. LOC139296 (Accession XM\_066612) is another VGAM1959 host target gene. LOC139296 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC139296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139296 BINDING SITE, designated SEQ ID:37339, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67958] Another function of VGAM1959 is therefore inhibition of LOC139296 (Accession XM\_066612). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139296. LOC143146 (Accession XM\_011844) is another VGAM1959 host target gene. LOC143146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143146 BINDING SITE, designated SEQ ID:30195, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67959] Another function of VGAM1959 is therefore inhibition of LOC143146 (Accession XM\_011844). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143146. LOC143279 (Accession XM\_084476) is another VGAM1959 host target gene. LOC143279 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143279 BINDING SITE, designated SEQ ID:37600, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67960] Another function of VGAM1959 is therefore inhibition of LOC143279 (Accession XM\_084476). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143279. LOC143425 (Accession XM\_113695) is another VGAM1959 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC143425 BINDING SITE, designated SEQ ID:42352, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67961] Another function of VGAM1959 is therefore inhibition of LOC143425 (Accession XM\_113695). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. LOC143719 (Accession XM\_027090) is another VGAM1959 host target gene. LOC143719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143719 BINDING SITE, designated SEQ ID:30405, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67962] Another function of VGAM1959 is therefore inhibition of LOC143719 (Accession XM\_027090). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143719. LOC144182 (Accession NM\_139136) is another VGAM1959 host target gene. LOC144182 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144182 BINDING SITE, designated SEQ ID:29167, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67963] Another function of VGAM1959 is therefore inhibition of LOC144182 (Accession NM\_139136). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144182. LOC144266 (Accession XM\_084795) is another VGAM1959 host target gene. LOC144266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144266 BINDING SITE, designated SEQ ID:37709, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67964] Another function of VGAM1959 is therefore inhibition of

LOC144266 (Accession XM\_084795). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144266. LOC144305 (Accession XM\_096572) is another VGAM1959 host target gene. LOC144305 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144305 BINDING SITE, designated SEQ ID:40399, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67965] Another function of VGAM1959 is therefore inhibition of LOC144305 (Accession XM\_096572). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144305. LOC144317 (Accession XM\_084813) is another VGAM1959 host target gene. LOC144317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC144317 BINDING SITE, designated SEQ ID:37717, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67966] Another function of VGAM1959 is therefore inhibition of LOC144317 (Accession XM\_084813). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144317. LOC144501 (Accession XM\_096612) is another VGAM1959 host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:40427, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67967] Another function of VGAM1959 is therefore inhibition of LOC144501 (Accession XM\_096612). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144501. LOC144535 (Accession XM\_084892) is an-

other VGAM1959 host target gene. LOC144535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144535 BINDING SITE, designated SEQ ID:37762, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67968] Another function of VGAM1959 is therefore inhibition of LOC144535 (Accession XM\_084892). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144535. LOC144871 (Accession XM\_096698) is another VGAM1959 host target gene. LOC144871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144871 BINDING SITE, designated SEQ ID:40468, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67969] Another function of VGAM1959 is therefore inhibition of LOC144871 (Accession XM\_096698). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144871. LOC145317 (Accession XM\_096760) is another VGAM1959 host target gene. LOC145317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145317 BINDING SITE, designated SEQ ID:40530, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67970] Another function of VGAM1959 is therefore inhibition of LOC145317 (Accession XM\_096760). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145317. LOC145622 (Accession XM\_085186) is another VGAM1959 host target gene. LOC145622 BINDING SITE1 through LOC145622 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC145622, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE1 through LOC145622 BINDING SITE3, designated SEQ ID:37907, SEQ ID:37908 and SEQ ID:37915 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67971] Another function of VGAM1959 is therefore inhibition of LOC145622 (Accession XM\_085186). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC145732 (Accession XM\_085218) is another VGAM1959 host target gene. LOC145732 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145732, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145732 BINDING SITE, designated SEQ ID:37958, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67972] Another function of VGAM1959 is therefore inhibition of LOC145732 (Accession XM\_085218). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145732. LOC145761 (Accession XM\_096855) is another VGAM1959 host target gene. LOC145761 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145761 BINDING SITE, designated SEQ ID:40583, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67973] Another function of VGAM1959 is therefore inhibition of LOC145761 (Accession XM\_096855). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145761. LOC145815 (Accession XM\_096874) is another VGAM1959 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145815 BINDING SITE, designated SEQ ID:40604, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67974] Another function of VGAM1959 is therefore inhibition of LOC145815 (Accession XM\_096874). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. LOC146237 (Accession XM\_096954) is another VGAM1959 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40667, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67975] Another function of VGAM1959 is therefore inhibition of LOC146237 (Accession XM\_096954). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237. LOC146332 (Accession XM\_085413) is another VGAM1959 host target gene. LOC146332 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146332 BINDING SITE, designated SEQ ID:38130, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67976] Another function of VGAM1959 is therefore inhibition of LOC146332 (Accession XM\_085413). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146332. LOC146452 (Accession XM\_085473) is another VGAM1959 host target gene. LOC146452 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146452 BINDING SITE, designated SEQ ID:38164, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67977] Another function of VGAM1959 is therefore inhibition of

LOC146452 (Accession XM\_085473). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146452. LOC146488 (Accession XM\_047748) is another VGAM1959 host target gene. LOC146488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:35050, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67978] Another function of VGAM1959 is therefore inhibition of LOC146488 (Accession XM\_047748). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC146513 (Accession XM\_097013) is another VGAM1959 host target gene. LOC146513 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146513 BINDING SITE, designated SEQ ID:40709, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67979] Another function of VGAM1959 is therefore inhibition of LOC146513 (Accession XM\_097013). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146513. LOC146714 (Accession XM\_097072) is another VGAM1959 host target gene. LOC146714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146714 BINDING SITE, designated SEQ ID:40720, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67980] Another function of VGAM1959 is therefore inhibition of LOC146714 (Accession XM\_097072). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146714. LOC146894 (Accession NM\_145273) is an-

other VGAM1959 host target gene. LOC146894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE, designated SEQ ID:29780, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67981] Another function of VGAM1959 is therefore inhibition of LOC146894 (Accession NM\_145273). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894. LOC146957 (Accession XM\_085652) is another VGAM1959 host target gene. LOC146957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146957 BINDING SITE, designated SEQ ID:38277, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67982] Another function of VGAM1959 is therefore inhibition of LOC146957 (Accession XM\_085652). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146957. LOC147054 (Accession XM\_097172) is another VGAM1959 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:40789, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67983] Another function of VGAM1959 is therefore inhibition of LOC147054 (Accession XM\_097172). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147054. LOC147136 (Accession XM\_085716) is another VGAM1959 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147136, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38303, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67984] Another function of VGAM1959 is therefore inhibition of LOC147136 (Accession XM\_085716). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC147165 (Accession XM\_097205) is another VGAM1959 host target gene. LOC147165 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147165 BINDING SITE, designated SEQ ID:40815, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67985] Another function of VGAM1959 is therefore inhibition of LOC147165 (Accession XM\_097205). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147165. LOC147178 (Accession XM\_028755) is another VGAM1959 host target gene. LOC147178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147178 BINDING SITE, designated SEQ ID:30743, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67986] Another function of VGAM1959 is therefore inhibition of LOC147178 (Accession XM\_028755). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147178. LOC147694 (Accession XM\_085843) is another VGAM1959 host target gene. LOC147694 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147694 BINDING SITE, designated SEQ ID:38371, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[67987] Another function of VGAM1959 is therefore inhibition of LOC147694 (Accession XM\_085843). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147694. LOC147859 (Accession XM\_103235) is another VGAM1959 host target gene. LOC147859 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147859, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147859 BINDING SITE, designated SEQ ID:42151, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67988] Another function of VGAM1959 is therefore inhibition of LOC147859 (Accession XM\_103235). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147859. LOC147993 (Accession XM\_103268) is another VGAM1959 host target gene. LOC147993 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147993, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147993 BINDING SITE, designated SEQ ID:42153, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67989] Another function of VGAM1959 is therefore inhibition of LOC147993 (Accession XM\_103268). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147993. LOC148089 (Accession XM\_086040) is another VGAM1959 host target gene. LOC148089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148089 BINDING SITE, designated SEQ ID:38450, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67990] Another function of VGAM1959 is therefore inhibition of LOC148089 (Accession XM\_086040). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC148089. LOC148397 (Accession XM\_086171) is another VGAM1959 host target gene. LOC148397 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148397 BINDING SITE, designated SEQ ID:38528, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67991] Another function of VGAM1959 is therefore inhibition of LOC148397 (Accession XM\_086171). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148397. LOC148710 (Accession XM\_097506) is another VGAM1959 host target gene. LOC148710 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148710 BINDING SITE, designated SEQ ID:40894, to

the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67992] Another function of VGAM1959 is therefore inhibition of LOC148710 (Accession XM\_097506). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148710. LOC148918 (Accession XM\_086361) is another VGAM1959 host target gene. LOC148918 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148918 BINDING SITE, designated SEQ ID:38614, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67993] Another function of VGAM1959 is therefore inhibition of LOC148918 (Accession XM\_086361). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148918. LOC148936 (Accession XM\_097556) is another VGAM1959 host target gene. LOC148936 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC148936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148936 BINDING SITE, designated SEQ ID:40932, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67994] Another function of VGAM1959 is therefore inhibition of LOC148936 (Accession XM\_097556). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148936. LOC148938 (Accession XM\_097555) is another VGAM1959 host target gene. LOC148938 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148938 BINDING SITE, designated SEQ ID:40925, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67995] Another function of VGAM1959 is therefore inhibition of LOC148938 (Accession XM\_097555). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148938. LOC148979 (Accession XM\_097568) is another VGAM1959 host target gene. LOC148979 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148979 BINDING SITE, designated SEQ ID:40942, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67996] Another function of VGAM1959 is therefore inhibition of LOC148979 (Accession XM\_097568). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148979. LOC149132 (Accession XM\_086428) is another VGAM1959 host target gene. LOC149132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC149132 BINDING SITE, designated SEQ ID:38645, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67997] Another function of VGAM1959 is therefore inhibition of LOC149132 (Accession XM\_086428). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149132. LOC149171 (Accession XM\_086450) is another VGAM1959 host target gene. LOC149171 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149171 BINDING SITE, designated SEQ ID:38666, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67998] Another function of VGAM1959 is therefore inhibition of LOC149171 (Accession XM\_086450). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149171. LOC149194 (Accession XM\_086458) is another VGAM1959 host target gene. LOC149194 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149194 BINDING SITE, designated SEQ ID:38669, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[67999] Another function of VGAM1959 is therefore inhibition of LOC149194 (Accession XM\_086458). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149194. LOC149267 (Accession NM\_138480) is another VGAM1959 host target gene. LOC149267 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149267 BINDING SITE, designated SEQ ID:28831, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68000] Another function of VGAM1959 is therefore inhibition of

LOC149267 (Accession NM\_138480). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149267. LOC149276 (Accession XM\_097621) is another VGAM1959 host target gene. LOC149276 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149276 BINDING SITE, designated SEQ ID:40978, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68001] Another function of VGAM1959 is therefore inhibition of LOC149276 (Accession XM\_097621). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149276. LOC149506 (Accession XM\_097661) is another VGAM1959 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41008, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68002] Another function of VGAM1959 is therefore inhibition of LOC149506 (Accession XM\_097661). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC149603 (Accession XM\_047499) is another VGAM1959 host target gene. LOC149603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149603 BINDING SITE, designated SEQ ID:34971, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68003] Another function of VGAM1959 is therefore inhibition of LOC149603 (Accession XM\_047499). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149603. LOC149620 (Accession XM\_086604) is an-

other VGAM1959 host target gene. LOC149620 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149620 BINDING SITE, designated SEQ ID:38788, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68004] Another function of VGAM1959 is therefore inhibition of LOC149620 (Accession XM\_086604). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149620. LOC149650 (Accession XM\_086623) is another VGAM1959 host target gene. LOC149650 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149650 BINDING SITE, designated SEQ ID:38793, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68005] Another function of VGAM1959 is therefore inhibition of LOC149650 (Accession XM\_086623). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149650. LOC149657 (Accession XM\_097702) is another VGAM1959 host target gene. LOC149657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149657 BINDING SITE, designated SEQ ID:41037, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68006] Another function of VGAM1959 is therefore inhibition of LOC149657 (Accession XM\_097702). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149657. LOC150142 (Accession XM\_086791) is another VGAM1959 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38851, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68007] Another function of VGAM1959 is therefore inhibition of LOC150142 (Accession XM\_086791). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC150150 (Accession XM\_097820) is another VGAM1959 host target gene. LOC150150 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150150 BINDING SITE, designated SEQ ID:41136, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68008] Another function of VGAM1959 is therefore inhibition of LOC150150 (Accession XM\_097820). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150150. LOC150372 (Accession XM\_086893) is another VGAM1959 host target gene. LOC150372 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150372 BINDING SITE, designated SEQ ID:38938, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68009] Another function of VGAM1959 is therefore inhibition of LOC150372 (Accession XM\_086893). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150372. LOC150421 (Accession XM\_097901) is another VGAM1959 host target gene. LOC150421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150421 BINDING SITE, designated SEQ ID:41204, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[68010] Another function of VGAM1959 is therefore inhibition of LOC150421 (Accession XM\_097901). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150421. LOC150776 (Accession XM\_032542) is another VGAM1959 host target gene. LOC150776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150776 BINDING SITE, designated SEQ ID:31677, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68011] Another function of VGAM1959 is therefore inhibition of LOC150776 (Accession XM\_032542). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776. LOC150819 (Accession XM\_097954) is another VGAM1959 host target gene. LOC150819 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150819, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150819 BINDING SITE, designated SEQ ID:41249, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68012] Another function of VGAM1959 is therefore inhibition of LOC150819 (Accession XM\_097954). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150819. LOC150935 (Accession XM\_087049) is another VGAM1959 host target gene. LOC150935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150935 BINDING SITE, designated SEQ ID:39021, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68013] Another function of VGAM1959 is therefore inhibition of LOC150935 (Accession XM\_087049). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150935. LOC151201 (Accession XM\_098021) is another VGAM1959 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41327, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68014] Another function of VGAM1959 is therefore inhibition of LOC151201 (Accession XM\_098021). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC151507 (Accession XM\_087225) is another VGAM1959 host target gene. LOC151507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151507 BINDING SITE, designated SEQ ID:39127, to

the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68015] Another function of VGAM1959 is therefore inhibition of LOC151507 (Accession XM\_087225). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151507. LOC151877 (Accession XM\_098132) is another VGAM1959 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41397, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68016] Another function of VGAM1959 is therefore inhibition of LOC151877 (Accession XM\_098132). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. LOC152078 (Accession XM\_087376) is another VGAM1959 host target gene. LOC152078 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC152078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152078 BINDING SITE, designated SEQ ID:39211, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68017] Another function of VGAM1959 is therefore inhibition of LOC152078 (Accession XM\_087376). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152078. LOC152441 (Accession XM\_098230) is another VGAM1959 host target gene. LOC152441 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152441 BINDING SITE, designated SEQ ID:41505, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68018] Another function of VGAM1959 is therefore inhibition of LOC152441 (Accession XM\_098230). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152441. LOC152765 (Accession XM\_087519) is another VGAM1959 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39315, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68019] Another function of VGAM1959 is therefore inhibition of LOC152765 (Accession XM\_087519). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC153020 (Accession XM\_087578) is another VGAM1959 host target gene. LOC153020 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC153020 BINDING SITE, designated SEQ ID:39354, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68020] Another function of VGAM1959 is therefore inhibition of LOC153020 (Accession XM\_087578). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153020. LOC153339 (Accession XM\_098362) is another VGAM1959 host target gene. LOC153339 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153339 BINDING SITE, designated SEQ ID:41615, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68021] Another function of VGAM1959 is therefore inhibition of LOC153339 (Accession XM\_098362). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153339. LOC153442 (Accession XM\_098373) is another VGAM1959 host target gene. LOC153442 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153442 BINDING SITE, designated SEQ ID:41636, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68022] Another function of VGAM1959 is therefore inhibition of LOC153442 (Accession XM\_098373). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153442. LOC153577 (Accession XM\_098394) is another VGAM1959 host target gene. LOC153577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153577 BINDING SITE, designated SEQ ID:41643, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68023] Another function of VGAM1959 is therefore inhibition of

LOC153577 (Accession XM\_098394). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153577. LOC153688 (Accession XM\_098416) is another VGAM1959 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41661, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68024] Another function of VGAM1959 is therefore inhibition of LOC153688 (Accession XM\_098416). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC153811 (Accession XM\_087779) is another VGAM1959 host target gene. LOC153811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:39415, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68025] Another function of VGAM1959 is therefore inhibition of LOC153811 (Accession XM\_087779). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153811. LOC154442 (Accession XM\_098536) is another VGAM1959 host target gene. LOC154442 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154442 BINDING SITE, designated SEQ ID:41705, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68026] Another function of VGAM1959 is therefore inhibition of LOC154442 (Accession XM\_098536). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154442. LOC157556 (Accession XM\_098783) is an-

other VGAM1959 host target gene. LOC157556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157556 BINDING SITE, designated SEQ ID:41821, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68027] Another function of VGAM1959 is therefore inhibition of LOC157556 (Accession XM\_098783). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157556. LOC157623 (Accession XM\_088346) is another VGAM1959 host target gene. LOC157623 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157623 BINDING SITE, designated SEQ ID:39615, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68028] Another function of VGAM1959 is therefore inhibition of LOC157623 (Accession XM\_088346). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157623. LOC157638 (Accession XM\_088350) is another VGAM1959 host target gene. LOC157638 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157638 BINDING SITE, designated SEQ ID:39623, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68029] Another function of VGAM1959 is therefore inhibition of LOC157638 (Accession XM\_088350). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157638. LOC157657 (Accession XM\_088352) is another VGAM1959 host target gene. LOC157657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157657, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157657 BINDING SITE, designated SEQ ID:39626, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68030] Another function of VGAM1959 is therefore inhibition of LOC157657 (Accession XM\_088352). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157657. LOC157773 (Accession XM\_088387) is another VGAM1959 host target gene. LOC157773 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157773 BINDING SITE, designated SEQ ID:39670, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68031] Another function of VGAM1959 is therefore inhibition of LOC157773 (Accession XM\_088387). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157773. LOC157848 (Accession XM\_088405) is another VGAM1959 host target gene. LOC157848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157848 BINDING SITE, designated SEQ ID:39672, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68032] Another function of VGAM1959 is therefore inhibition of LOC157848 (Accession XM\_088405). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157848. LOC157860 (Accession XM\_098832) is another VGAM1959 host target gene. LOC157860 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157860 BINDING SITE, designated SEQ ID:41861, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[68033] Another function of VGAM1959 is therefore inhibition of LOC157860 (Accession XM\_098832). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157860. LOC158056 (Accession XM\_088463) is another VGAM1959 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:39720, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68034] Another function of VGAM1959 is therefore inhibition of LOC158056 (Accession XM\_088463). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056. LOC158156 (Accession XM\_088496) is another VGAM1959 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158156, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:39739, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68035] Another function of VGAM1959 is therefore inhibition of LOC158156 (Accession XM\_088496). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. LOC158332 (Accession XM\_088554) is another VGAM1959 host target gene. LOC158332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158332 BINDING SITE, designated SEQ ID:39825, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68036] Another function of VGAM1959 is therefore inhibition of LOC158332 (Accession XM\_088554). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158332. LOC158476 (Accession XM\_098955) is another VGAM1959 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:41999, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68037] Another function of VGAM1959 is therefore inhibition of LOC158476 (Accession XM\_098955). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. LOC158549 (Accession XM\_098963) is another VGAM1959 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42012, to

the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68038] Another function of VGAM1959 is therefore inhibition of LOC158549 (Accession XM\_098963). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC160336 (Accession XM\_090228) is another VGAM1959 host target gene. LOC160336 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC160336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160336 BINDING SITE, designated SEQ ID:39996, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68039] Another function of VGAM1959 is therefore inhibition of LOC160336 (Accession XM\_090228). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160336. LOC160414 (Accession XM\_100898) is another VGAM1959 host target gene. LOC160414 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC160414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160414 BINDING SITE, designated SEQ ID:42103, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68040] Another function of VGAM1959 is therefore inhibition of LOC160414 (Accession XM\_100898). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160414. LOC160484 (Accession XM\_090326) is another VGAM1959 host target gene. LOC160484 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC160484, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160484 BINDING SITE, designated SEQ ID:39998, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68041] Another function of VGAM1959 is therefore inhibition of LOC160484 (Accession XM\_090326). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160484. LOC160717 (Accession XM\_090457) is another VGAM1959 host target gene. LOC160717 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC160717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160717 BINDING SITE, designated SEQ ID:40006, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68042] Another function of VGAM1959 is therefore inhibition of LOC160717 (Accession XM\_090457). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160717. LOC162333 (Accession XM\_102591) is another VGAM1959 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC162333 BINDING SITE, designated SEQ ID:42135, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68043] Another function of VGAM1959 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC163682 (Accession XM\_099402) is another VGAM1959 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42090, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68044] Another function of VGAM1959 is therefore inhibition of LOC163682 (Accession XM\_099402). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC165908 (Accession XM\_093523) is another VGAM1959 host target gene. LOC165908 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165908 BINDING SITE, designated SEQ ID:40196, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68045] Another function of VGAM1959 is therefore inhibition of LOC165908 (Accession XM\_093523). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165908. LOC166793 (Accession NM\_145291) is another VGAM1959 host target gene. LOC166793 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166793 BINDING SITE, designated SEQ ID:29806, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68046] Another function of VGAM1959 is therefore inhibition of

LOC166793 (Accession NM\_145291). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166793. LOC166983 (Accession XM\_106422) is another VGAM1959 host target gene. LOC166983 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166983, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166983 BINDING SITE, designated SEQ ID:42198, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68047] Another function of VGAM1959 is therefore inhibition of LOC166983 (Accession XM\_106422). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166983. LOC170082 (Accession XM\_093092) is another VGAM1959 host target gene. LOC170082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC170082 BINDING SITE, designated SEQ ID:40173, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68048] Another function of VGAM1959 is therefore inhibition of LOC170082 (Accession XM\_093092). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170082. LOC170221 (Accession XM\_093188) is another VGAM1959 host target gene. LOC170221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170221 BINDING SITE, designated SEQ ID:40182, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68049] Another function of VGAM1959 is therefore inhibition of LOC170221 (Accession XM\_093188). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170221. LOC170394 (Accession XM\_096329) is an-

other VGAM1959 host target gene. LOC170394 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC170394, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170394 BINDING SITE, designated SEQ ID:40313, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68050] Another function of VGAM1959 is therefore inhibition of LOC170394 (Accession XM\_096329). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170394. LOC195977 (Accession XM\_113625) is another VGAM1959 host target gene. LOC195977 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC195977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC195977 BINDING SITE, designated SEQ ID:42302, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68051] Another function of VGAM1959 is therefore inhibition of LOC195977 (Accession XM\_113625). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC195977. LOC196337 (Accession XM\_113696) is another VGAM1959 host target gene. LOC196337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196337 BINDING SITE, designated SEQ ID:42361, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68052] Another function of VGAM1959 is therefore inhibition of LOC196337 (Accession XM\_113696). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196337. LOC196478 (Accession XM\_113729) is another VGAM1959 host target gene. LOC196478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196478, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196478 BINDING SITE, designated SEQ ID:42378, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68053] Another function of VGAM1959 is therefore inhibition of LOC196478 (Accession XM\_113729). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196478. LOC196510 (Accession XM\_113738) is another VGAM1959 host target gene. LOC196510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196510 BINDING SITE, designated SEQ ID:42394, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68054] Another function of VGAM1959 is therefore inhibition of LOC196510 (Accession XM\_113738). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196510. LOC196812 (Accession XM\_116868) is another VGAM1959 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43133, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68055] Another function of VGAM1959 is therefore inhibition of LOC196812 (Accession XM\_116868). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. LOC196860 (Accession XM\_116945) is another VGAM1959 host target gene. LOC196860 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196860 BINDING SITE, designated SEQ ID:43153, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[68056] Another function of VGAM1959 is therefore inhibition of LOC196860 (Accession XM\_116945). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196860. LOC196872 (Accession XM\_113760) is another VGAM1959 host target gene. LOC196872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196872 BINDING SITE, designated SEQ ID:42419, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68057] Another function of VGAM1959 is therefore inhibition of LOC196872 (Accession XM\_113760). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196872. LOC196957 (Accession XM\_113789) is another VGAM1959 host target gene. LOC196957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196957, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196957 BINDING SITE, designated SEQ ID:42430, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68058] Another function of VGAM1959 is therefore inhibition of LOC196957 (Accession XM\_113789). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196957. LOC196961 (Accession XM\_113790) is another VGAM1959 host target gene. LOC196961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196961 BINDING SITE, designated SEQ ID:42439, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68059] Another function of VGAM1959 is therefore inhibition of LOC196961 (Accession XM\_113790). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC196961. LOC197138 (Accession XM\_113829) is another VGAM1959 host target gene. LOC197138 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197138 BINDING SITE, designated SEQ ID:42457, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68060] Another function of VGAM1959 is therefore inhibition of LOC197138 (Accession XM\_113829). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197138. LOC197273 (Accession XM\_041139) is another VGAM1959 host target gene. LOC197273 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197273 BINDING SITE, designated SEQ ID:33472, to

the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68061] Another function of VGAM1959 is therefore inhibition of LOC197273 (Accession XM\_041139). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197273. LOC197342 (Accession XM\_113869) is another VGAM1959 host target gene. LOC197342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:42485, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68062] Another function of VGAM1959 is therefore inhibition of LOC197342 (Accession XM\_113869). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342. LOC199704 (Accession XM\_113994) is another VGAM1959 host target gene. LOC199704 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC199704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199704 BINDING SITE, designated SEQ ID:42605, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68063] Another function of VGAM1959 is therefore inhibition of LOC199704 (Accession XM\_113994). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199704. LOC199733 (Accession XM\_117123) is another VGAM1959 host target gene. LOC199733 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199733 BINDING SITE, designated SEQ ID:43245, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68064] Another function of VGAM1959 is therefore inhibition of LOC199733 (Accession XM\_117123). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199733. LOC199858 (Accession XM\_114040) is another VGAM1959 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42635, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68065] Another function of VGAM1959 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC199920 (Accession XM\_114056) is another VGAM1959 host target gene. LOC199920 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC199920 BINDING SITE, designated SEQ ID:42662, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68066] Another function of VGAM1959 is therefore inhibition of LOC199920 (Accession XM\_114056). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199920. LOC199990 (Accession XM\_114083) is another VGAM1959 host target gene. LOC199990 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199990 BINDING SITE, designated SEQ ID:42680, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68067] Another function of VGAM1959 is therefore inhibition of LOC199990 (Accession XM\_114083). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199990. LOC200059 (Accession XM\_114104) is another VGAM1959 host target gene. LOC200059 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200059 BINDING SITE, designated SEQ ID:42702, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68068] Another function of VGAM1959 is therefore inhibition of LOC200059 (Accession XM\_114104). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200059. LOC200093 (Accession XM\_032184) is another VGAM1959 host target gene. LOC200093 BINDING SITE1 and LOC200093 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC200093, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE1 and LOC200093 BINDING SITE2, designated SEQ ID:31599 and SEQ ID:31605 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA,

also designated SEQ ID:4670.

[68069] Another function of VGAM1959 is therefore inhibition of LOC200093 (Accession XM\_032184). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC200220 (Accession XM\_114157) is another VGAM1959 host target gene. LOC200220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200220 BINDING SITE, designated SEQ ID:42743, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68070] Another function of VGAM1959 is therefore inhibition of LOC200220 (Accession XM\_114157). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200220. LOC200953 (Accession XM\_117302) is another VGAM1959 host target gene. LOC200953 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200953, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200953 BINDING SITE, designated SEQ ID:43366, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68071] Another function of VGAM1959 is therefore inhibition of LOC200953 (Accession XM\_117302). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200953. LOC201382 (Accession XM\_113963) is another VGAM1959 host target gene. LOC201382 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201382 BINDING SITE, designated SEQ ID:42573, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68072] Another function of VGAM1959 is therefore inhibition of LOC201382 (Accession XM\_113963). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC201382. LOC201627 (Accession XM\_114353) is another VGAM1959 host target gene. LOC201627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201627 BINDING SITE, designated SEQ ID:42897, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68073] Another function of VGAM1959 is therefore inhibition of LOC201627 (Accession XM\_114353). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201627. LOC201911 (Accession XM\_117339) is another VGAM1959 host target gene. LOC201911 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201911 BINDING SITE, designated SEQ ID:43392, to

the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68074] Another function of VGAM1959 is therefore inhibition of LOC201911 (Accession XM\_117339). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201911. LOC204804 (Accession XM\_115599) is another VGAM1959 host target gene. LOC204804 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204804 BINDING SITE, designated SEQ ID:43099, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68075] Another function of VGAM1959 is therefore inhibition of LOC204804 (Accession XM\_115599). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204804. LOC204820 (Accession XM\_119323) is another VGAM1959 host target gene. LOC204820 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC204820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204820 BINDING SITE, designated SEQ ID:43584, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68076] Another function of VGAM1959 is therefore inhibition of LOC204820 (Accession XM\_119323). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204820. LOC206463 (Accession XM\_116523) is another VGAM1959 host target gene. LOC206463 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC206463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206463 BINDING SITE, designated SEQ ID:43123, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68077] Another function of VGAM1959 is therefore inhibition of LOC206463 (Accession XM\_116523). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206463. LOC219793 (Accession XM\_166127) is another VGAM1959 host target gene. LOC219793 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219793 BINDING SITE, designated SEQ ID:43916, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68078] Another function of VGAM1959 is therefore inhibition of LOC219793 (Accession XM\_166127). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219793. LOC220018 (Accession XM\_167816) is another VGAM1959 host target gene. LOC220018 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220018 BINDING SITE, designated SEQ ID:44854, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68079] Another function of VGAM1959 is therefore inhibition of LOC220018 (Accession XM\_167816). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220018. LOC220020 (Accession XM\_167821) is another VGAM1959 host target gene. LOC220020 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220020 BINDING SITE, designated SEQ ID:44864, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68080] Another function of VGAM1959 is therefore inhibition of LOC220020 (Accession XM\_167821). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220020. LOC220705 (Accession XM\_166000) is another VGAM1959 host target gene. LOC220705 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220705 BINDING SITE, designated SEQ ID:43833, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68081] Another function of VGAM1959 is therefore inhibition of LOC220705 (Accession XM\_166000). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220705. LOC220766 (Accession XM\_165471) is another VGAM1959 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43657, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68082] Another function of VGAM1959 is therefore inhibition of

LOC220766 (Accession XM\_165471). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC221143 (Accession XM\_167986) is another VGAM1959 host target gene. LOC221143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221143 BINDING SITE, designated SEQ ID:44943, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68083] Another function of VGAM1959 is therefore inhibition of LOC221143 (Accession XM\_167986). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221143. LOC221178 (Accession XM\_167936) is another VGAM1959 host target gene. LOC221178 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221178 BINDING SITE, designated SEQ ID:44928, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68084] Another function of VGAM1959 is therefore inhibition of LOC221178 (Accession XM\_167936). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221178. LOC221415 (Accession XM\_168137) is another VGAM1959 host target gene. LOC221415 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221415 BINDING SITE, designated SEQ ID:45064, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68085] Another function of VGAM1959 is therefore inhibition of LOC221415 (Accession XM\_168137). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221415. LOC221496 (Accession XM\_166338) is an-

other VGAM1959 host target gene. LOC221496 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221496 BINDING SITE, designated SEQ ID:44177, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68086] Another function of VGAM1959 is therefore inhibition of LOC221496 (Accession XM\_166338). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221496. LOC221692 (Accession XM\_166420) is another VGAM1959 host target gene. LOC221692 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221692 BINDING SITE, designated SEQ ID:44297, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68087] Another function of VGAM1959 is therefore inhibition of LOC221692 (Accession XM\_166420). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221692. LOC221756 (Accession XM\_166394) is another VGAM1959 host target gene. LOC221756 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221756 BINDING SITE, designated SEQ ID:44241, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68088] Another function of VGAM1959 is therefore inhibition of LOC221756 (Accession XM\_166394). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221756. LOC221922 (Accession XM\_166555) is another VGAM1959 host target gene. LOC221922 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221922, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221922 BINDING SITE, designated SEQ ID:44533, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68089] Another function of VGAM1959 is therefore inhibition of LOC221922 (Accession XM\_166555). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221922. LOC222060 (Accession XM\_168427) is another VGAM1959 host target gene. LOC222060 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222060 BINDING SITE, designated SEQ ID:45162, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68090] Another function of VGAM1959 is therefore inhibition of LOC222060 (Accession XM\_168427). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC222060. LOC222134 (Accession XM\_168432) is another VGAM1959 host target gene. LOC222134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222134 BINDING SITE, designated SEQ ID:45171, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68091] Another function of VGAM1959 is therefore inhibition of LOC222134 (Accession XM\_168432). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222134. LOC222602 (Accession XM\_167171) is another VGAM1959 host target gene. LOC222602 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222602 BINDING SITE, designated SEQ ID:44618, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[68092] Another function of VGAM1959 is therefore inhibition of LOC222602 (Accession XM\_167171). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222602. LOC245727 (Accession XM\_165913) is another VGAM1959 host target gene. LOC245727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC245727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245727 BINDING SITE, designated SEQ ID:43798, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68093] Another function of VGAM1959 is therefore inhibition of LOC245727 (Accession XM\_165913). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245727. LOC245728 (Accession XM\_165922) is another VGAM1959 host target gene. LOC245728 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245728, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245728 BINDING SITE, designated SEQ ID:43802, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68094] Another function of VGAM1959 is therefore inhibition of LOC245728 (Accession XM\_165922). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245728. LOC245771 (Accession XM\_167366) is another VGAM1959 host target gene. LOC245771 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:44636, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68095] Another function of VGAM1959 is therefore inhibition of LOC245771 (Accession XM\_167366). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC245771. LOC253001 (Accession XM\_171711) is another VGAM1959 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46060, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68096] Another function of VGAM1959 is therefore inhibition of LOC253001 (Accession XM\_171711). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. LOC253216 (Accession XM\_170765) is another VGAM1959 host target gene. LOC253216 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253216 BINDING SITE, designated SEQ ID:45521, to

the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68097] Another function of VGAM1959 is therefore inhibition of LOC253216 (Accession XM\_170765). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253216. LOC253539 (Accession XM\_171134) is another VGAM1959 host target gene. LOC253539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253539 BINDING SITE, designated SEQ ID:45939, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68098] Another function of VGAM1959 is therefore inhibition of LOC253539 (Accession XM\_171134). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253539. LOC254228 (Accession XM\_171123) is another VGAM1959 host target gene. LOC254228 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC254228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254228 BINDING SITE, designated SEQ ID:45921, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68099] Another function of VGAM1959 is therefore inhibition of LOC254228 (Accession XM\_171123). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254228. LOC255452 (Accession XM\_174088) is another VGAM1959 host target gene. LOC255452 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255452 BINDING SITE, designated SEQ ID:46574, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68100] Another function of VGAM1959 is therefore inhibition of LOC255452 (Accession XM\_174088). Accordingly, utilities

of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255452. LOC255458 (Accession XM\_173150) is another VGAM1959 host target gene. LOC255458 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255458 BINDING SITE, designated SEQ ID:46407, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68101] Another function of VGAM1959 is therefore inhibition of LOC255458 (Accession XM\_173150). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255458. LOC255535 (Accession XM\_171034) is another VGAM1959 host target gene. LOC255535 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC255535 BINDING SITE, designated SEQ ID:45807, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68102] Another function of VGAM1959 is therefore inhibition of LOC255535 (Accession XM\_171034). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255535. LOC255743 (Accession XM\_171089) is another VGAM1959 host target gene. LOC255743 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255743 BINDING SITE, designated SEQ ID:45902, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68103] Another function of VGAM1959 is therefore inhibition of LOC255743 (Accession XM\_171089). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255743. LOC256158 (Accession XM\_175125) is another VGAM1959 host target gene. LOC256158 BINDING

SITE1 through LOC256158 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC256158, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE1 through LOC256158 BINDING SITE3, designated SEQ ID:46622, SEQ ID:46623 and SEQ ID:46632 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68104] Another function of VGAM1959 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. LOC256307 (Accession XM\_173118) is another VGAM1959 host target gene. LOC256307 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256307, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256307 BINDING SITE, designated SEQ ID:46370, to the nucleotide sequence of VGAM1959 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4670.

[68105] Another function of VGAM1959 is therefore inhibition of LOC256307 (Accession XM\_173118). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256307. LOC256492 (Accession XM\_174467) is another VGAM1959 host target gene. LOC256492 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256492 BINDING SITE, designated SEQ ID:46592, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68106] Another function of VGAM1959 is therefore inhibition of LOC256492 (Accession XM\_174467). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256492. LOC256781 (Accession XM\_174695) is another VGAM1959 host target gene. LOC256781 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256781, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256781 BINDING SITE, designated SEQ ID:46602, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68107] Another function of VGAM1959 is therefore inhibition of LOC256781 (Accession XM\_174695). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256781. LOC256867 (Accession XM\_170694) is another VGAM1959 host target gene. LOC256867 BINDING SITE1 and LOC256867 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC256867, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256867 BINDING SITE1 and LOC256867 BINDING SITE2, designated SEQ ID:45473 and SEQ ID:45476 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68108] Another function of VGAM1959 is therefore inhibition of

LOC256867 (Accession XM\_170694). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256867. LOC51308 (Accession NM\_016606) is another VGAM1959 host target gene. LOC51308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51308 BINDING SITE, designated SEQ ID:18710, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68109] Another function of VGAM1959 is therefore inhibition of LOC51308 (Accession NM\_016606). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51308. LOC51334 (Accession NM\_016644) is another VGAM1959 host target gene. LOC51334 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC51334 BINDING SITE, designated SEQ ID:18751, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68110] Another function of VGAM1959 is therefore inhibition of LOC51334 (Accession NM\_016644). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51334. LOC85028 (Accession NM\_053040) is another VGAM1959 host target gene. LOC85028 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC85028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85028 BINDING SITE, designated SEQ ID:27585, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68111] Another function of VGAM1959 is therefore inhibition of LOC85028 (Accession NM\_053040). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85028. LOC90249 (Accession XM\_030300) is another

VGAM1959 host target gene. LOC90249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90249 BINDING SITE, designated SEQ ID:31008, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68112] Another function of VGAM1959 is therefore inhibition of LOC90249 (Accession XM\_030300). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90249. LOC90342 (Accession XM\_031009) is another VGAM1959 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90342 BINDING SITE, designated SEQ ID:31257, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68113] Another function of VGAM1959 is therefore inhibition of LOC90342 (Accession XM\_031009). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. LOC90826 (Accession XM\_034321) is another VGAM1959 host target gene. LOC90826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90826 BINDING SITE, designated SEQ ID:32050, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68114] Another function of VGAM1959 is therefore inhibition of LOC90826 (Accession XM\_034321). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90826. LOC91040 (Accession XM\_035641) is another VGAM1959 host target gene. LOC91040 BINDING SITE1 and LOC91040 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91040, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE1 and LOC91040 BINDING SITE2, designated SEQ ID:32316 and SEQ ID:32322 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68115] Another function of VGAM1959 is therefore inhibition of LOC91040 (Accession XM\_035641). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. LOC91355 (Accession XM\_037825) is another VGAM1959 host target gene. LOC91355 BINDING SITE1 and LOC91355 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91355, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91355 BINDING SITE1 and LOC91355 BINDING SITE2, designated SEQ ID:32705 and SEQ ID:32808 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68116] Another function of VGAM1959 is therefore inhibition of LOC91355 (Accession XM\_037825). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91355. LOC91464 (Accession XM\_038589) is another VGAM1959 host target gene. LOC91464 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91464 BINDING SITE, designated SEQ ID:32874, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68117] Another function of VGAM1959 is therefore inhibition of LOC91464 (Accession XM\_038589). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91464. LOC91565 (Accession XM\_039231) is another VGAM1959 host target gene. LOC91565 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91565, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91565 BINDING SITE, designated SEQ ID:33023, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68118] Another function of VGAM1959 is therefore inhibition of LOC91565 (Accession XM\_039231). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91565. LOC91782 (Accession XM\_040612) is another VGAM1959 host target gene. LOC91782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91782 BINDING SITE, designated SEQ ID:33336, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68119] Another function of VGAM1959 is therefore inhibition of LOC91782 (Accession XM\_040612). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91782. LOC91828 (Accession XM\_040910) is another VGAM1959 host target gene. LOC91828 BINDING SITE1 and LOC91828 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91828, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91828 BINDING SITE1 and LOC91828 BINDING SITE2, designated SEQ ID:33407 and SEQ ID:33409 respectively, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68120] Another function of VGAM1959 is therefore inhibition of LOC91828 (Accession XM\_040910). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91828. LOC92162 (Accession XM\_043273) is another VGAM1959 host target gene. LOC92162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC92162 BINDING SITE, designated SEQ ID:33921, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68121] Another function of VGAM1959 is therefore inhibition of LOC92162 (Accession XM\_043273). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92162. LOC92230 (Accession XM\_043733) is another VGAM1959 host target gene. LOC92230 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92230 BINDING SITE, designated SEQ ID:34007, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68122] Another function of VGAM1959 is therefore inhibition of LOC92230 (Accession XM\_043733). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92230. LOC93109 (Accession XM\_049278) is another VGAM1959 host target gene. LOC93109 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93109 BINDING SITE, designated SEQ ID:35374, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68123] Another function of VGAM1959 is therefore inhibition of LOC93109 (Accession XM\_049278). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93109. LOC93444 (Accession XM\_051455) is another VGAM1959 host target gene. LOC93444 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93444 BINDING SITE, designated SEQ ID:35844, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68124] Another function of VGAM1959 is therefore inhibition of

LOC93444 (Accession XM\_051455). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93444. LOC95702 (Accession XM\_031446) is another VGAM1959 host target gene. LOC95702 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC95702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC95702 BINDING SITE, designated SEQ ID:31384, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68125] Another function of VGAM1959 is therefore inhibition of LOC95702 (Accession XM\_031446). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC95702. LOC96597 (Accession XM\_039922) is another VGAM1959 host target gene. LOC96597 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC96597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:33233, to the nucleotide sequence of VGAM1959 RNA, herein designated VGAM RNA, also designated SEQ ID:4670.

[68126] Another function of VGAM1959 is therefore inhibition of LOC96597 (Accession XM\_039922). Accordingly, utilities of VGAM1959 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1960 (VGAM1960) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[68127] VGAM1960 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1960 was detected is described hereinabove with reference to Figs. 1–8.

[68128] VGAM1960 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1960 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[68129] VGAM1960 gene encodes a VGAM1960 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1960 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1960 precursor RNA is designated SEQ ID:1946, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1946 is located at position 10523 relative to the genome of Macaca Mulatta Rhadinovirus.

[68130] VGAM1960 precursor RNA folds onto itself, forming VGAM1960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[68131] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1960 folded precursor RNA into VGAM1960 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1960 RNA is designated SEQ ID:4671, and is provided hereinbelow with reference to the sequence listing part.

[68132] VGAM1960 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1960 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[68133] VGAM1960 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1960 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1960 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[68134] The complementary binding of VGAM1960 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1960 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1960 host target RNA into VGAM1960 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[68135] It is appreciated that VGAM1960 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1960 host target genes. The mRNA of each one of this plurality of VGAM1960 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1960 RNA, herein designated VGAM RNA, and which when bound by VGAM1960 RNA causes inhibition of translation of respective one or more VGAM1960 host target proteins.

[68136] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1960 gene, herein designated VGAM GENE, on one or more VGAM1960 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[68137] It is yet further appreciated that a function of VGAM1960 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1960 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1960 correlate with, and may be deduced from, the identity of the host target genes which VGAM1960 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[68138] Nucleotide sequences of the VGAM1960 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1960 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1960 are further described hereinbelow with reference to Table 1.

[68139] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1960 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1960 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[68140] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1960 gene, herein designated VGAM is inhibition of expression of VGAM1960 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1960 correlate with, and may be deduced from, the identity of the target genes which VGAM1960 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[68141] Angiotensin II Receptor, Type 1 (AGTR1, Accession NM\_000685) is a VGAM1960 host target gene. AGTR1 BINDING SITE1 through AGTR1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGTR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGTR1 BINDING SITE1 through AGTR1 BINDING SITE5, designated SEQ ID:6342, SEQ ID:11243, SEQ ID:14309, SEQ ID:25594 and SEQ

ID:25769 respectively, to the nucleotide sequence of VGAM1960 RNA, herein designated VGAM RNA, also designated SEQ ID:4671.

[68142] A function of VGAM1960 is therefore inhibition of Angiotensin II Receptor, Type 1 (AGTR1, Accession NM\_000685), a gene which is an important effector controlling blood pressure and volume in the cardiovascular system. Accordingly, utilities of VGAM1960 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGTR1. The function of AGTR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM96. Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963) is another VGAM1960 host target gene. ARHGEF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF6 BINDING SITE, designated SEQ ID:33848, to the nucleotide sequence of VGAM1960 RNA, herein designated VGAM RNA, also designated SEQ

ID:4671.

[68143] Another function of VGAM1960 is therefore inhibition of Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963). Accordingly, utilities of VGAM1960 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF6. Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_138271) is another VGAM1960 host target gene. ATRX BINDING SITE1 and ATRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATRX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRX BINDING SITE1 and ATRX BINDING SITE2, designated SEQ ID:28685 and SEQ ID:6096 respectively, to the nucleotide sequence of VGAM1960 RNA, herein designated VGAM RNA, also designated SEQ ID:4671.

[68144] Another function of VGAM1960 is therefore inhibition of Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_138271). Accordingly, utilities of VGAM1960 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRX. Caldesmon 1 (CALD1, Accession NM\_033138) is another VGAM1960 host target gene. CALD1 BINDING SITE1 and CALD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CALD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALD1 BINDING SITE1 and CALD1 BINDING SITE2, designated SEQ ID:26992 and SEQ ID:27010 respectively, to the nucleotide sequence of VGAM1960 RNA, herein designated VGAM RNA, also designated SEQ ID:4671.

[68145] Another function of VGAM1960 is therefore inhibition of Caldesmon 1 (CALD1, Accession NM\_033138), a gene which is implicated in the regulation of actomyosin interactions in smooth muscle and nonmuscle cells. Accordingly, utilities of VGAM1960 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALD1. The function of CALD1 has been established by previous studies. Caldesmon is a potential actomyosin regulatory protein found in smooth muscle and nonmuscle cells. Domain mapping and physical studies

suggested that CDM is an elongated molecule with an N-terminal myosin/calmodulin-binding domain and a C-terminal tropomyosin/actin/calmodulin-binding domain separated by a 40-nm-long central helix. Humphrey et al. (1992) used a probe encoding part of avian caldesmon to screen a human aorta library and clone smooth-muscle and nonmuscle CDM-encoding cDNAs. The predicted smooth-muscle polypeptide is 793 amino acids long. As in the case of chicken CDM, nonmuscle CDM was missing the central helical domain of 256 amino acids. The non-muscle form appeared to be generated by exon skipping. Humphrey et al. (1992) suggested that the CDMs are a small family of highly conserved proteins which are probably derived from a single gene. The high molecular weight caldesmon is predominantly expressed in smooth muscles, whereas the low molecular weight caldesmon is widely distributed in nonmuscle tissues and cells. Hayashi et al. (1992) demonstrated that the human CDM gene is composed of 14 exons. By fluorescence in situ hybridization, they showed that it is encoded by a single gene located at 7q33-q34. The regulation of high molecular weight and low molecular weight caldesmon expression was thought to depend on selection of the 2 5-prime

splice sites within exon 3.

[68146] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[68149] Further studies establishing the function and utilities of CALD1 are found in John Hopkins OMIM database record ID 114213, and in cited publications numbered 4030–4031 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dihydropyrimidinase-like 2 (DPYSL2, Accession NM\_001386) is another VGAM1960 host target gene. DPYSL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYSL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide
